THE

PROGRESS OF AMERICA

FROM THE

DISCOVERY BY COLUMBUS TO THE YEAR 1840

BY JOHN MACGREGOR,

SECRETARY OF THE BOARD OF COMMERCE,
C. WHITING, BEAUFORT-HOUSE, STRAND.

VOL. I.

HISTORICAL AND STATISTICAL

LONDON:

WHITAKER AND CO., AVE MARIA LANE.

1847

TO THE
RIGHT HONOURABLE THE LORD JOHN RUSSELL, M.P.,
FIRST LORD OF THE TREASURY, &c. &c.

MY DEAR LORD,

I TAKE the liberty, without consulting your Lordship, to dedicate to you these volumes on the Progress of the European Settlements in America; and I beg to offer this testimony of respect and confidence, not merely to the Prime Minister of the Crown, but especially to your Lordship individually, as a Man of Letters, an Historian, and a Statesman.

Believe me,

MY DEAR LORD,

Ever yours,

With great faithfulness,

JOHN MACGREGOR.

3, Lowndes Square,
London, March 20th, 1847.

TO THE

RIGHT HONOURABLE THE LORD JOHN RUSSELL, M.P.
FIRST LORD OF THE TREASURY, &c. &c.

My dear Lord,

I take the liberty, without consulting your Lordship, to dedicate to you these volumes on the Progress of the European Settlements in America; and I beg to offer this testimony of respect and confidence, not merely to the Prime Minister of the Crown, but especially to your Lordship individually, as a Man of Letters, an Historian, and a Statesman.

Believe me,

My dear Lord,

I am yours

With great esteem,

JOHN MACGREGOR.

St. James's Square,
London, March 20th, 1847.

INTRODUCTION.

THE progress of Europeans in America, from the discovery of that hemisphere by Columbus in 1492, down to the present time, affords the most interesting, as well as the most instructive, study for all classes of readers. The philosopher, the historian, the legislator, the statesman, the agriculturist, the manufacturer, the merchant, the navigator, the traveller, and the enthusiastic adventurer, will all find the most abundant materials for study, in the facts, as far as they can be ascertained, which have distinguished the modern nations of America—from the date of their first settlement, and during their struggles and growth, in maintaining their establishments, until they became more powerful than the aboriginal occupants.

The progress, and present condition, of the Spanish and Anglo-Saxon colonies, which have achieved their independence, as organised republics,—of the vast region in which Portugal planted settlements, and which has become an independent sovereign hereditary empire,—and of those colonies, which still remain subject to the crowns of England, France, and Spain, constitute a work of such varied magnitude, that, the mere attempt to have undertaken it, may be considered rash and presumptuous. That the application and labour which has enabled me to produce the work that I now submit to the world, has been necessarily long and severe, will, I believe, not be denied me. That it is the first work embracing so many subjects, will also be granted. The responsibility of undertaking it, I can merely justify by ascribing its origin to an enthusiasm, which accompanied me in my youth to the British settlements, in America,—and which was first inspired by the writings of Robertson, Charlevoix, and Raynal—by poring over Hakluyt, and Purchas, and the more recent collections of voyages and travels,—and by an ambition, entertained on perusing with delight the travels of a near relative, the late Sir Alexander Mackenzie, to the arctic shores, and afterwards across the broadest part of the continent of America to the Pacific. The more I studied the progress of the European settlements in America, the more thoroughly was

93

I convinced of what I deem an infallible truth, THAT THE HISTORY OF NAVIGATION AND COMMERCE IS THE HISTORY OF CIVILISATION. I admit civilisation and civil liberty do not necessarily accompany the progress of navigation and commerce: for there may exist a highly refined state of civilisation, and at the same time extensive commerce, without civil liberty, as we have ample proofs of, in Italy during the rule of the Medici, and in France, during the age of Louis the Fourteenth. But the mechanical achievements, the civilisation, and the intelligence, which are infallibly the results of the intercourse of nations, and of the interchange of commodities, have been the great causes and the palladiums of civil liberty. This undeniable truth will be found evident in tracing the progress of the Anglo-American and the Spanish-American states.

Robertson, Raynal, Burke, and others, but none down to the more recent, and, in a political, commercial, and maritime view—the most important, period, have written historical annals of the progress of European settlements in America. But all published accounts appeared to me defective, if not altogether wanting, in statistical accounts of the planting, growth, and condition of the several states of North and South America; and during the many years which occupied me in collecting and arranging the materials of these volumes, I was throughout convinced that no satisfactory accounts, of the western hemisphere, could be executed, unless the work comprehended the historical, geographical, and statistical progress of America.

This was the groundwork of my attempt and of my labour. This work, which has been the result of both, I now humbly submit to the public judgment.

The AUTHORITIES upon which I have relied are generally given in the text of, or in the notes to, these volumes. The historical parts, are, according to the most accredited Spanish, French, Portuguese, Dutch, and English authorities, compared with records, which have more recently been discovered in Madrid, Venice, Paris, and Mexico. I regret that the historical sketch, and the account which I have given of Mexico, was written, and printed, before I saw the history of that conquest by Mr. Prestcott, which will account for my not even alluding to a history that must ever retain the highest and the most deserved rank in the annals of America. It is, however, satisfactory to me, although I have not had recourse to so many authorities as Mr. Prestcott has discovered, that my brief account of the conquest of Mexico, is not at variance with his work.

Of English writers on Mexico and South America, Robertson and Southey have been consulted, but neither, except when corroborated by the ablest Spanish authorities. Among the other works to which I have referred, are those written by the Jesuit missionaries, by Dobrizhoffer, Charlevoix, Herrera, Las Casas, Clavigero, Siman de Vasconcellos, Pietro Martine, Gomara, Lery, Hans Stade, Bernard Diaz, and De Solis; also, the letters of Cortez, several archives rela-

tive to America in the *Bibliothèque du Roi*, and copies of records which were formerly transmitted from the French American settlements to the *Bureau de la Marine et des Colonies*, at Paris;—the admirable collection of voyages, in Italian, by Ramusio, printed at Venice;—the most trustworthy parts of the work of the Abbé Raynal;—and that great collection, *L'Histoire General des Voyages, par l'Abbé Prevost*;—the admirable accounts of South America, in the collection of voyages by Harris; and the quaint writings of Hakluyt and Purchas.

A work, little, if at all, known in England, but which I have consulted is, *L'Histoire du Brezil depuis sa découverte, in 1500, jusqu'en 1810. Par M. Alphonse de Beauchamp: Paris, 1815.* It is in many respects, more to be relied on than either Robertson or Southey: not but that both the latter were conscientiously honest, as historians. The first, however, held untenable opinions respecting the aborigines of America, and Southey was over credulous.

The Geographical Dictionary of America, by Alcedo, in Spanish, has been much celebrated, but we have found it, generally, a worthless authority, except to those who are curious about chronological lists of bishops in Spanish America. The notes, or additions to it, by Thompson are valuable; and the *Dictionnaire Geographique de la Martiniere*, published at Venice, in 1738, in ten folio volumes, though at one time a work of great authority, has become nearly obsolete in its descriptions.

I collected several of the journals, published chiefly at Paris, of those daring adventurers the buccaneers,—and referred to them with little confidence, but was astonished at the remarkably correct descriptions they gave of the places which they had infested.

The small, and more recent work on the Portuguese colonies, by Da Cunha de Azerado Coutinho, Bishop of Pernambuco,—the writings of modern Brazilians,—and of all the recent travellers who have published accounts of Mexico, Central, and South America, have also been consulted. With respect to North America, I have had recourse to the best authorities in English and French. These, with the records which I personally collected, official reports made to the general and state governments of the United States, especially those presented annually to Congress, and those of the several expeditions by sea to the coasts of Oregon and California, and, by land, to both the latter, and to Mexico,—the official reports received from South America,—the statistical returns which have been drawn up for the government of Brazil,—and those published at Carracas,—the work of Juarros on Guatemala,—the work of De Lavaysse on Venezuela,—numerous official returns relative to Cuba and Porto Rico,—several records, and consular reports on Hayti,—Mr. Consul Cowper's excellent report on the province of Pernambuco, Alagoas, and the Rio de Francisco,—late official returns from Rio Janeiro and Para,—an account of the latter province and the Amazon by a native,—M. de la Condamine's *Voyage and Survey of*

the River Amazon,—Mr. Belford Wilson's reports on the Columbian States ;—the valuable returns made by the French consuls, and printed by the Minister of Commerce at Paris, are the chief authorities on the present state of South America. Generally, with the exceptions above-stated, I have been unable to obtain little information from the British consuls in America. They afford nothing from Mexico, or Central America, worth quoting, and the consular returns, from the United States, have been so utterly worthless that, with the exception of one return from Boston, I have scarcely once alluded to them. This want of consular information has, however, been amply supplied by the official returns forwarded to me, and for which I am gratefully indebted to my friends in the United States. Mr. Webster and the late lamented Mr. Upshur have obligingly sent me very ample official returns. These, with the reports of the Commissioner of Patents,—various returns sent me by Mr. Hunt, the intelligent and able editor of the *Merchants' Magazine*, numerous returns from Boston, Washington, New York, Philadelphia, Baltimore, Charleston, New Orleans, and the western states,—official returns of the state of New York, sent me by my friend, Mr. Isaiah Townsend, of Albany,—reports on the whale and other fisheries of the United States,—Mr. Lee's *Letters to Cotton Manufacturers*,—the reports of Mr. Dallas—those of Mr. Walker, the secretary of the treasury, and numerous reports on the banks, currency, finances, canals, railways, manufactures, agriculture, trade, and navigation of the United States, form the groundwork of all the statistical information contained in the second volume of this work. The article on the constitution of the United States—see Supplement to the first volume—by the late Hon. Judge Upshur, was forwarded by him to me, I believe, on the morning of the very day on which a lamentable catastrophe deprived America of one of her most virtuous citizens.

I have not attempted to write a detailed history of the United States. My object has been to exhibit the progress of settlement, population, commerce, and navigation,—the causes of colonial discontent,—the independence,—and the present physical, moral, social, and political condition of the great Anglo-Saxon republic. Its history has been partially written by many authors. It has been admirably commenced, and will be completed throughout, with great care and ability by an historian worthy of the subject, my friend, Mr. Bancroft, now the representative of the United States in Great Britain.

In the second volume will be found a criticism on Mr. Upshur's *Review* of the "Constitution of the United States," by the Hon. J. C. Spencer, one of the ablest jurists in the state of New York,—and, although it is extremely difficult, if not impossible, to controvert altogether Mr. Upshur's conclusions, I am decidedly of opinion that those great men, who framed the constitution of the United States of America, considered its principles, and its spirit, to be in accordance with the judgment recorded by Mr. Spencer upon that extraordinary code:

a constitution, probably the nearest to perfection, which the conception, forecast, and judgment of the human intellect is capable of producing, for the union, peace, and liberty of mankind. To say that it is perfect, it would first be necessary to prove that human nature has attained perfection. That the constitution of the United States is to be an ever-enduring code, which shall bind in harmony that vast region, is more than we can hope to anticipate, however anxiously we may desire, that it may continue, in peaceful integrity, to be the sacred palladium of federal liberty, order, and power.

Without entering into these historically minute details, which would extend this work to many additional volumes, my great object has been to exhibit clearly to the world the progress of all America since the discovery, by Columbus, in 1492.

In tracing this progress, the reader will not fail to remark the astonishingly rapid and brilliant subjugation by the Spaniards of the fairest regions of the new world, during the first century after its discovery. He will also remark that all attempts on the part of England and France failed for the first 110 years; and, that, after the first huts were erected by the French in Acadia and Canada, in the year 1605, how painfully slow and unprofitable was the progress of France in all her struggles to colonise America.

The early attempts of England were still more disastrous; and even when a permanent settlement was finally, in 1607, established in Virginia, and, in 1620, in New England, the progress of English colonisation was at last only successful by the most enduring perseverance and industry; and, by the adventurers suffering the most incredible privations. But, although the progress of the Anglo-American colonies was for some time slow, and unattended with brilliant military exploits, its establishment was founded on civil liberty and on religious freedom, and on intelligent and practical principles of government. The structure which, consequently, arose on this solid groundwork became durable and powerful. In the year 1759, no one speaking the English language owned an acre of land, in any of the countries within the Gulf and River of St. Lawrence, nor on the banks of the Great Lakes, nor in Florida, Mississippi, nor in any of the regions west of the Alleghany mountains. In all the territories, from the Atlantic to the Pacific,—from Hudson's Bay to the Gulf of Mexico, the power of France has vanished. In all North America, with the exception of part of Mexico and Guatemala, those who speak the Spanish tongue cease to possess the soil, or to rule the people. A race, speaking the English language, have advanced over, and subdued, the most wilderness regions by an indomitable spirit of progress; which would seem to gain strength as it grows. Whether the Anglo-Saxon power shall continue to be wielded by two governments, as at present,—the British and the great Anglo-American republic;—or, whether, as is most probable, it will hereafter separate into many;—yet, the people speak—

ing, and reading,—and legislating, and governing in the use of, the English language, appear to have a destiny in the progress of the future; as they have had, in that of the past, which neither policy, nor diplomacy, can prevent,—which circumstances will as surely accelerate, as physical elements move the great bodies which revolve in the heavens, until that progress shall present to future generations in each region of North and South America, its natural and certain effect. That effect will inevitably be, that the legislation and the literature will be written, the debates spoken, the arts and sciences expounded, and the conversation between man and man be expressed, in the English language. We may safely hazard this forecast of the future, by a rational examination of the past.

Contemplating this, to me, inevitable destiny of the Anglo-Saxon progress, I have examined the past, and the present, of America, completely divested of political bias, and apart from the prejudices of education, language, or country. I have deliberately considered the history, the sequences, and consequences, of eventful facts. All my researches prove the undeniable fact—that the history of commerce is the history of civilisation. The records, from the earliest periods, of the intercourse and of the interchange of commodities—first between families and tribes,—afterwards between the nations of the earth, fully demonstrate—that those people become the most powerful, and intelligent, who are impelled forward, the most, by the spirit of industry, invention, production, navigation, and trade,—the necessary elements of commerce and its progress.

When the vice-royalties of Spain, in America, revolted against the crown, they engaged in their cause, in like manner, as every people struggling for liberty have, and ever will, the most ardent hopes, and the most generous sympathies, of the intelligent, the virtuous, and the liberal minds of Europe, and of Anglo-Saxon America.

They beheld the Spanish colonists as determined to rival the bold and successful resistance of the British Americans to a domination, which, though often severe and unjust, was paternal, when compared to the royal absolutism, and the hierarchical bondage of the crown and church of Spain, which smothered both civil liberty and religious freedom.

The world, however, knew not the political, the social, the moral, or the educational condition of the people who inhabited Spanish America. Europe, and especially England and France, and Holland, beheld the progress of the revolutions in South and Central America and in Mexico, as glorious efforts, which would release them from the tyranny of Spanish kings, and a popish church, and which would bring forth new, independent, and free, nations. It was hoped and believed, that if once independent of the domination of Ferdinand, and if their new, free, governments were recognised by England, France, Holland, and the United States, the Spanish American Republics, animated by the progress, and

instructed by the example, of the great Anglo-Saxon Republic, would have advanced steadily along with the march of civilisation, in civil liberty, and religious freedom,—in the useful education of the people, in bringing forth, profitably, the great agricultural, mineral, forest, and commercial resources of their vast and fertile territories.

But the inhabitants of free countries had not studied—in truth, it was almost impossible for them to know—the condition, morally and physically, of the Spanish race in the colonies. Hence has arisen the disappointment which has been experienced in regard to the progress of the republics of Mexico and South America; and, had he lived, no man would have been more thoroughly mortified at the present condition, and the deplorable prospects of those states, than George Canning, the British minister, who first announced that England had acknowledged, and added, more free and independent notions, to the constitutional states of the world.

In our examination of the progress of the revolutions in Spanish America, we have discovered no formidable impediment to the final success of those revolts against the crown and domination of Spain. But it is an extraordinary fact in the history of a people once so formidable, that there is not at the present time, in the year 1846-7, any portion of the known world where the Spanish language is spoken, in which there is either civil liberty or religious freedom,—in which there is not the spirit of anarchy,—and, in which there is confidence, or security, in the government.

CHILE forms in some respects an exception, but disturbance has been so frequent, that the world has not confidence in the security even of this state. VENEZUELA has been for some time in comparative tranquillity, but order and peace have been too often interrupted for us to consider that state as secure in its future prospects. All the Argentine states have long been, and are still, involved amidst the most barbarous civil war or anarchy. Paraguay may still be considered as a partial exception. The Peruvian states and New Granada have been long in anarchy or at war. The annals of Central America recapitulate only civil war, and massacre,—and, for some years, an uneducated man of aboriginal race, named Herara, has domineered in Guatemala. The condition of Mexico is hopeless. This will appear fully detailed in the fourth book of the first volume of this work. Ignorance,—the bigotry of the priesthood,—the tenacity with which the race speaking the Spanish language inherit all the vices and forget most of the virtues of their ancestors,—the retention, too generally in practice, of the vicious fiscal and commercial regulations of old Spain,—the absolute decrease or the scarcely perceptible increase of the population,—the want of enterprise,—the prevalence of indolence, and of slovenly agriculture,—the absence of commercial habits, are far more than sufficient to account for the powerless condition of the Spanish American republics. It is a deplorable fact, that the Spanish republics

are in an infinitely less prosperous condition than the slave-holding colonies of Cuba and Porto Rico : not that we consider the peace of Cuba as likely to be permanent, for we believe, that if the slave-trade is not effectually abolished, that Cuba is destined to share the fate of Hayti. The condition of the latter republic we have also included in this work.

The extraordinary power, wealth, and prosperity of Anglo-America, are owing to far different causes; to a population which has increased in numbers with unexampled prosperity,—possessing abundant employment, and an untiring energy, industry, and self-reliance, animated at all times by a sleepless commercial and maritime spirit—with extraordinary intelligence, as to all matters concerning the active affairs of the world,—and a fearless perseverance in search of adventure, coupled with the passion for gain: all these are maintained by that feeling of independent action, which civil liberty and religious freedom inspire. Whatever may be the imperfections of humanity, and especially that of slavery in the southern states, which we may not approve of in the Anglo-Americans, the destiny of their progress will, in the western world, however they may hereafter be divided into governments, be indomitable in its advancement.

The reader will find in these volumes sketches of the colonial policy of European nations in America. The barbarising colonial policy of Spain,—the blind colonial policy of Portugal,—and the delusive colonial policy of France, are all examined. The latter is, however, like many other fallacies, eulogised by Burke, but he understood it not, and was merely dazzled by the mechanism of its centralisation in a bureau at Paris.

As intimately connected with the progress of America, I have concluded the second volume with an essay on the commercial and fiscal legislation of England and the United States.

PROGRESS OF AMERICA.

CONTENTS OF VOLUME I.

BOOK I.

	PAGE		PAGE
CHAP. I. Epoch of Discovery.....	1	missions Verranoni to make Discoveries—Jacques Cartier discovers the St. Lawrence—Coligni—The Huguenots, under his auspices, attempt to colonise Brazil and Florida—Disastrous End of those Colonists	60
CHAP. II. Second and Third Voyages of Columbus	5	CHAP. XI. Aborigines of North America	67
CHAP. III. Discoveries continued—Torres de Pincon—Vespuci—Bastidas—Cathagena—Ponce de Leon, conquers Porto-Rico, and discovers Florida—Conquest of Cuba—Jamaica—Nunez de Balbao discovers the Pacific	8	CHAP. XII. Settlement of Acadia, or Nova Scotia, by France.....	74
CHAP. IV. Discovery of Mexico—Hernandez discovers Campeachy—Grijalva sails to Florida and along the Shores of Mexico—Cortez sails from Cuba to conquer Mexico	12	CHAP. XIII. French Settlements in the West Indies	89
CHAP. V. Conquest of Mexico continued—The Aztecs, or Mexicanos—Their Government and Religion—Moctezuma confined by Cortez—Progress of the War—Death of Moctezuma—His Successor Guatimozin taken Prisoner, and final Surrender of Mexico	21	CHAP. XIV. French Settlements at Newfoundland, Cape Breton, and St. John's Island.....	99
CHAP. VI. Conquest of Peru and the remaining Countries of Spanish America....	37	CHAP. XV. French Discoveries and Settlements in Canada	105
CHAP. VII. Conduct of the Spanish Conquerors towards the Aborigines of America	50	CHAP. XVI. Company of New France, surrender their charter.....	112
CHAP. VIII. Discovery and Conquests of the Portuguese and Dutch in America....	53	CHAP. XVII. The Jesuits in Canada—Discovery of the Mississippi	115
CHAP. IX. Origin and Progress of Negro-Slavery in America	57	CHAP. XVIII. Jealousies of French and English in regard to the Fur Trade, &c..	119
CHAP. X. French Discoveries and Settlements in America—Francis I. com-		CHAP. XIX. Perilous Condition of Canada....	124
		CHAP. XX. French Settlements in Louisiana—Mississippi Scheme	130
		CHAP. XXI. Condition of Canada before its Conquest by the English	139
		CHAP. XXII. Conquest of Canada	143
		CHAP. XXIII. Condition of the French Canadians on their becoming subject to the British Crown	145
		CHAP. XXIV. Present Condition and Character of Canadians of French Origin...	148

BOOK II.

BRITISH AMERICA.

CHAP. I. English Voyagers to America.....	158	CHAP. VIII. Characteristics of the Anglo-Americans	199
CHAP. II. Attempt to Colonise Virginia—Sir Walter Raleigh	160	CHAP. IX. The Intercourse of the United States with Foreign Nations—Neutral Trade—Napoleon's Decrees—Confiscation of American Ships and Cargoes—British Orders in Council—England and America	206
CHAP. III. First permanent Settlement in Virginia—Gosnold's Voyage—Expedition sent to James's River—Captain Smith	164	CHAP. X. Review of Events in the United States since the Peace of 1815—Presidencies of Mr. Munroe and John Quincy Adams	224
CHAP. IV. Settlement of the New England and Midland States	172	CHAP. XI. Administrations of General Andrew Jackson, General Harrison, President Tyler, and President Polk	229
CHAP. V. Causes of Discontent in the Colonies	181	Notes to Book II	252
CHAP. VI. Europe and America, during the Revolution	187		
CHAP. VII. Condition of the United States at the Peace of 1783—Washington—Constitution and Laws—Resources..	193		

BOOK III. EMPIRE OF BRAZIL.

	PAGE		PAGE
CHAP. I. Historical Sketch, until the Foundation of the Dutch Settlements.....	260	— Dom Pedro appointed Regent..	280
CHAP. II. Effects of the Invasion of Portugal by France—Arrival of the Royal Family in Brazil—Consequent Changes—Opening of the Ports	276	— — — — — Crowned as Constitutional Emperor of Brazil.....	286
		CHAP. III. Reign of Dom Pedro II.	295

BOOKS IV.—V.

SPANISH AMERICAN REPUBLICS.

CHAP. I. Spanish Colonial Policy	305	CHAP. XXV. Exploration, by Spain, of the North-western Coast of America.....	533
CHAP. II. Divisions of Spanish America under the Monarchy	309	CHAP. XXVI. Russian America	544
CHAP. III. Spanish American Republics.....	314	CHAP. XXVII. Aboriginal Tribes of Oregon..	545
CHAP. IV. Mexico—Description of, and Natural Resources	315	CHAP. XXVIII. Overland Expeditions from the United States to Oregon and California.....	548
CHAP. V. Population and Departments.....	317	CHAP. XXIX. Constitution of Mexico.....	632
CHAP. VI. Configuration, Soil, and Climate..	319	CHAP. XXX. Reflection on the Present Condition and Prospects of Mexico.....	637
CHAP. VII. Mexico, Proper.....	323	CHAP. XXXI. Statistics of Mexico, Population, Religion, and Ecclesiastical Establishments, Education	640
CHAP. VIII. Route and Country from Vera Cruz to the City of Mexico.....	331	CHAP. XXXII. Revenue and Expenditure, National Debt and Finance	647
CHAP. IX. New Mexico	359	CHAP. XXXIII. Army and Navy of Mexico..	656
CHAP. X. Sketches of the Department of Mexico—Mr. Mayer's Excursions... ..	371	CHAP. XXXIV. Mines and Minerals.....	658
CHAP. XI. Characteristics of the Inhabitants of Mexico	384	CHAP. XXXV. Agriculture of Mexico.....	661
CHAP. XII. City and Department, formerly the Intendancy of Mexico.....	389	CHAP. XXXVI. Manufactures	670
CHAP. XIII. Old California	409	CHAP. XXXVII. Commerce and Navigation of Mexico under the Spanish Government	674
CHAP. XIV. New, or Upper California.....	411	CHAP. XXXVIII. Treaties of Commerce, &c., between the United States and Spanish American Republics	684
CHAP. XV. Expedition to explore the Bay of San Francisco, and Upper Country.	427	CHAP. XXXIX. Customs, Tariffs, and Regulations of the Spanish American Republics	695
CHAP. XVI. Establishments, on the West and South of the Bay of San Francisco... ..	435	CHAP. XL. Yucatan Statistics, &c.	710
CHAP. XVII. Southern Oregon.....	442	CHAP. XLI. Agriculture, Trade, and Manufactures of Yucatan	714
CHAP. XVIII. Exploration of Northern Oregon and the Columbia River, by the United States Exploring Expeditions	456	CHAP. XLII. Descriptive Sketches of Yucatan	715
CHAP. XIX. Nisqually—Hudson Bay Company's Trading and Agricultural Operations	463	CHAP. XLIII. British Honduras, or Belize....	726
CHAP. XX. Hudson Bay Company's Posts in Oregon	473	CHAP. XLIV. The Mahogany Tree of Honduras	734
CHAP. XXI. Willamette Valley	483	CHAP. XLV. The Mosquito Territory.....	739
CHAP. XXII. Expedition to Walla-Walla	494	CHAP. XLVI. Descriptive Sketches of the Mosquito Shore.....	754
CHAP. XXIII. Expedition to Okonagan in 1841.....	508		
CHAP. XXIV. Survey of the Columbia River (1841) by the United States Exploring Expedition	520		

BOOK VI.

CENTRAL AMERICA ; OR, GUATEMALA.

CHAP. I. Geographical Position, Configuration, Climate, Population, Minerals, Forests, Wild Animals, Lakes, and Rivers	779	CHAP. IV. Miscellaneous Sketches of Central America.....	799
CHAP. II. Harbours and Towns of Central America	788	CHAP. V. Route from Guatemala to Palenque	815
CHAP. III. Route over the Mountains, from the Gulf of Dulce to Guatemala.....	796	CHAP. VI. Isthmus of Panama and of Nicaragua, &c.	820
		CHAP. VII. Observations on the Construction of a Canal between the Atlantic and Pacific Oceans.....	839

	PAGE		PAGE
— Descriptive Sketch of the Isthmus of Tehuantepec.....	847	CHAP. XVI. Peru—General Sketches of the Soil and Climate	929
— Wild Animals, Agriculture, &c. &c.	852	CHAP. XVII. Descriptive Sketches of Peru.....	937
— Sketch of the Northern Division of the Isthmus, within the Department of Vera Cruz	855	CHAP. XVIII. Minerals ditto	949
— Projected Canal across the Isthmus of Panama	861	CHAP. XIX. Climate ditto	951
— Canal Route by the Isthmus of Nicaragua.....	866	CHAP. XX. Population ditto	857
CHAP. VIII. Ancient Ruins of Central America	876	CHAP. XXI. Agriculture and Live Stock	966
CHAP. IX. Agriculture of ditto.....	882	CHAP. XXII. Manufactures, Government, &c.	973

PROGRESS OF AMERICA.

HISTORICAL.

BOOK I.

CHAPTER I.

EPOCH OF DISCOVERY.

THE history of the world does not afford an epoch more important to mankind than the discovery of America* by Columbus, in 1492. It formed, as is well known, an era that gave a new, and more adventurous, direction to the ambition of European nations; and, while the consequent passion of enterprise sent bold spirits to the vast regions of the newly-found world,—and, simultaneously, by an almost equally great discovery,—that of sailing round Africa, to the eastern Indies,—fresh explorations enriched the sciences,—and, from that period, geography, astronomy, and navigation, became more practically, and more usefully, known.

The beginning of the fifteenth century—the epoch preceding the discovery of the western world, and the first voyage, accomplished by sea, to the oriental Indies—may well be considered the great advent of European regeneration. It was at this period that the people, and the intellect, of Europe manifested a decided reaction from a state of degradation, below which mankind could not have been brutalised, either by ecclesiastical terror, or baronial tyranny. Charles VII., and Louis XI., were among the first princes, who exercised their authority, in humbling the power, and checking the licentiousness, of the barons. The church, in the assumption of universal, temporal as well as spiritual, power, had long disregarded, both in practice and in precept, the simple and beautiful doctrines of primitive Christianity; and imposed, instead, over the human mind, a most darkening absolutism, and a most passive obedience. It was the glaring wickedness of the papal exactions that brought forth Luther—it was the vices of the clergy that rendered inevitable a Reformation, which, even in that great division of the Christian world that did not abandon its doctrines, nor, change its ceremonies, tended greatly to purify the Romish church, itself, of its disgusting immoralities; and, finally, to render its ecclesiastics, in moral character, as they were afterwards known to be, and are now found to be, among the most exemplary of pastors.

* This false name should be suppressed, and that of COLUMBIA ought, in truth and justice, to be adopted by the general consent of mankind.

But amidst all the barbarous turmoils of Europe, during the thirteenth, fourteenth, and fifteenth centuries, we find that it was the fisheries, the navigation, and the trade which had struggled through the middle ages, that originated the spirit of liberty and intelligence which has civilised Europe—that is civilising, and will civilise, the whole world. It was to enjoy freedom that the fishermen who founded Venice fled from the northern barbarians, to sterile, sandy, or marshy islands in the Adriatic; that the fishermen and traders of the Low Countries founded, in a country of difficult access, and without minerals or building materials, the navigation, fleets, and commerce of Holland. The safety and extension of maritime voyages, and trading intercourse, created that Hanseatic league, which destroyed the pirates who ravaged the Atlantic coasts and the shores of the Baltic. The Florentine merchant-princes were the first to revive the arts, and learning, in Italy. The discovery of the powers of the magnet was successfully applied to navigation; and by this wonderful and certain guide, in traversing the ocean with confidence, the Venetians, Genoese, Florentines, and Pisans, were emboldened to extend their voyages to unusual distances, and to send trading adventurers to the ports of western Europe. The Portuguese became also, in consequence, a maritime power. England, from her position, her wants, and her products, and in consequence of the descents of the Northmen, began to share early in navigation and trade; but the bloody contests for sovereign power—the wars with Scotland—the wars and the turbulence of government, in Ireland—and the ignorance, or the selfishness, of the British sovereigns and barons, until after the reign of Henry VII., retarded that progress of maritime discovery and power, and of commercial enterprise, which has advanced with a greater rapidity, since that period, than can elsewhere be found in the records of history.

France is considered to have become a maritime power soon after the accession of Charlemagne; and the ships of that prince are said to have defeated the Saracens in a sea-fight off Genoa. The author of the *Orbis Maritimus*, says, Charles Martel vanquished the ships of the Frisons, in 528.

A most remarkable coincidence of events distinguishes the period which followed the application of the magnet to the mariner's compass, and the age which, immediately, commenced after the discovery of America, and of the East Indies by sea. During this epoch gunpowder and the art of printing were both invented; ancient learning, the arts and sciences, were revived; a powerful and successful resistance to the papal authority was declared; and the balance of power, among princes, became a leading policy in Europe.

To Portugal, and to her sovereign, King John I., is due the honour of being the first nation, and prince, in Europe, to undertake great discoveries. Some adventurers from Spain fell in, previously, with the Canaries; but this discovery was not considered a national enterprise; although the Pope, in his assumed divine right to all the countries of the world, granted, in perpetuity, these *Fortunate Islands*, as they were called, with their infidel inhabitants, as slaves to Louis de la Cerda, of the royal family of Castile, who transferred them afterwards to a Norman baron.

In the year 1412, John I., King of Portugal, commenced those voyages along the coasts of Africa, directed by his son Prince Henry, which, in 1419, discovered Madeira, and in 1433, extended so far south as to double Cape Boyador, and to enter the dreaded Torrid Zone. Before the death of Prince Henry, in 1463, the Azores, and

Cape de Verd Islands, were discovered by the Portuguese. From this period, until the accession of John II., the nephew of Prince Henry, in 1481, the spirit of maritime discovery languished, in Portugal, although a trade, with the previously-found countries was carried on without interruption. In 1484, John II. fitted out a powerful fleet, and declared himself the patron of navigation and discovery. It was in his service, that Columbus completed that knowledge, and acquired that distinction, which prepared him for engaging in the voyages that render his name immortal.* The Portuguese, after advancing south, and forming establishments along the coast of Africa, reached the Cape of Good Hope; and a voyage round it was accomplished by Vasco de Gama, in the year 1417, five years after the discovery of America by Columbus.

The mind of this extraordinary man had, from an early period, been occupied in preparing the design of the sublime enterprise that was destined to extend the limits, to which ignorance, and superstition had confined the boundaries of the earth. He, as a dutiful citizen, made his first proposal, to sail westward to the Indies, to Genoa. His offer was rejected, as that of a visionary adventurer. He felt the consolation arising from having discharged a patriotic obligation, but was mortified, but not disheartened, that his native country, should have derided a project, which he foresaw would extend fame to the nation, under whose auspices it should be undertaken.

He was received favourably by John II. of Portugal, where the intelligence, and nautical skill, and boldness of Columbus were well known, and where he had married the daughter of Perestrello, the discoverer of Madeira. But Ortis, the bishop of Ceuta, not only thwarted his views, and derided them as chimerical, but meanly attempted to deprive him of the honour, by sending in the direction proposed by Columbus, a vessel under a Portuguese pilot, in order to attempt and secure the glory of the discovery. The pilot had neither the genius nor the fortitude which are necessary to accomplish bold enterprises. He consequently failed in the treacherous attempt.

Columbus applied soon afterwards to the government of France. But neither the prince nor the people had, at that period, been animated by the spirit of maritime discovery. The chivalrous and generous Francis I. had not ascended the throne; and, it was destined that the most brilliant project, ever made, was rejected:—a project which finally succeeded under the patronage of a royal family, which became, in consequence, the most powerful rival that ever mortified the predecessors of the house of Bourbon.†

Columbus then sent his brother, Bartholomew, to the court of Henry VII. of England. That distrustful prince, after one bold and successful attempt to obtain the crown, never encouraged great, if, in his mind, the least hazardous or doubtful, enterprises. He, however, by slight, but not conclusive, promises, detained Bartholomew in England for six years; and the latter finally arranged with the king for the employment of his brother Christopher in the proposed voyage of discovery.‡

* Columbus, previously to his serving in the navy of Portugal, was bred to the sea in the Mediteranean. He had also sailed as far north as Iceland, and within the Arctic circle.

† This offer to France is stated by Burke in his account of the European Settlements in America. Robertson does not allude to it.

‡ Bartholomew, on concluding this contract, proceeded to Portugal, or Spain, to join his brother. It was at Paris, on his way, that he first learnt, that Christopher had, since they parted, discovered the New World.

In the meantime Columbus, disgusted with the meanness, and exasperated by the treachery of Ortis, proceeded with his charts, and proposals, to the court of Ferdinand and Isabella. For eight years, he exercised his address, his patience, his interest, and his abilities, at this court, so remarkable then, and long after, for the tardiness of its decisions. It is a trite remark, that projectors are enthusiasts. It is fortunate that this accusation is true as regards the projectors of arduous undertakings ; otherwise the spirit and the health of Columbus, would have been subdued, before he accomplished his great mission. He had to endure the most fatiguing delays, and to hear pronounced against him presumptuous, and insulting judgments, by the ignorant, and by the bigoted. To the honour of Isabella and her sex, and at her own expense,* we are bound to attribute, in justice, the final success of Columbus : who, after displaying, during eight years, in his whole character and conduct, an assiduity, a firmness and resolve of mind, never sufficiently to be applauded and imitated, sailed from Cadiz on the 3rd of August, 1492, on the most daring enterprise ever undertaken by man.

He proceeded on this voyage without any chart to guide him,—with no acquaintance with the currents, the winds, or climates, of unknown seas and lands,—and in ignorance of the magnetic variation. His own genius and instinctive judgment,—his confidence in the spherical system of the world, although the law of gravity was undiscovered,—his knowledge of the human heart,—and his address in commanding, and winning, those placed under his authority, enabled him to prevail over a crew which at length became impatient, and to advance in ignorance of imaginary, as well as real dangers, until he discovered the island of San Salvador, on the 12th of October, 1492.

Columbus, on his first voyage, discovered San Salvador, Hayti, and Cuba. He opened a friendly intercourse with the inhabitants ; obtained permission to build a fort, at a place which he called Navidad, on the north side of Hayti, where he left a colony of thirty men, with various stores. He then returned towards Europe with gold, cotton, &c., and accompanied by some of the natives. He experienced a boisterous, dangerous, and tedious passage. He put into the port of Lisbon with his vessels crippled. John II. received him with honourable respect, although mortified at having lost for ever, by rejecting the offer made formerly by Columbus, the glory of discovering a world, which was now to be assigned to Spain. Columbus proceeded to the court of Ferdinand and Isabella, where he was received with as much distinction, as was consistent with the cold, and formal etiquette of the royal household of Spain.

It is not within our present design to enter on the history of this memorable achievement. The voyages of Columbus, have often been, and especially by a distinguished American, well narrated.

It was, comparatively speaking, at a late period of the world's history, that the discovery, by Columbus, constituted the first, known, Christian acquaintance with a whole hemisphere, possessing all climates, fertile soils, precious metals and stones ; all the ordinary minerals ; forests of the most useful and beautiful wood ; magnificent rivers ; numerous and safe harbours ; plentiful fisheries ;—inhabited by a human race, unknown to, and differing in colour, in manners, and in religion, from the people of all previously

* She actually borrowed the money to fit out the expedition on the security of her own jewels.

known countries; and abounding, also, in multitudes of wild animals. This discovery was no sooner announced than the Romish church, and the ambitious princes of Christendom, resolved that all its regions should be explored, the natives conquered, converted, or exterminated; and that the discovered regions should be subjected to the sovereigns, who sent forth men to discover, and conquer, and possess them. It would, at the same time, have been well for the reputation of Europeans, if their acquaintance with, and colonisation of, those territories, had been equally distinguished for justice and humanity.

Of all the tenures on which the right of soil is founded, there is none superior to that of immemorial occupancy. This supreme right of the red men, to the country they inhabited, was founded in nature. It was to the aborigines of America, the free and bounteous gift of heaven. Europeans declared this tenure of no validity; for the dark superstition of the times, and the passions of avarice, and conquest, represented the all-just, and merciful Deity, as the partial God of Christians. The Spaniards were the first to inculcate this monstrous doctrine; and, under the authority of their king, and the sanction of the pope, instituted it as their measure of right, in robbing, from the aboriginal nations, the richest countries of the continent, and the magnificent islands of Cuba, Hayti, Jamaica, and Porto Rico. Queen Elizabeth and King James denied the papal authority, but the same spirit of avarice and ambition made them adopt, without scruple, the subterfuge of Christian, over heathen, right to the countries discovered by their servants.

The Aboriginal tribes, however numerous, were at first easily subdued, or betrayed, by Europeans. Being ignorant of the use of fire-arms, and of scientific warfare, they looked upon their invaders, not, as men, but as supernatural, invulnerable spirits, sent forth by the gods; nor did they fully believe that white men were mortals, until they became masters of the red nations, and of the lands in which their fathers lay entombed. Columbus, on his first voyage, opened a friendly intercourse with the natives of St. Salvador, Hayti, and Cuba; and that great man was alone guiltless of the atrocities and cruelties towards the aborigines, which were exercised by the succeeding Spanish governors and adventurers.

CHAPTER II.

SECOND AND THIRD VOYAGES OF COLUMBUS.

ON the 25th of September, 1493, Columbus sailed on his second voyage, as admiral and commander-in-chief, with a fleet of seventeen ships of various sizes, and 1500 men: many of whom were of noble families. He carried with him several European plants, trees, seeds, wheat, and other grain for sowing; horses, and a bull and cows; also materials, and tools, for building houses and ships. On the 2nd of November he discovered Dominica, and from thence he sailed to Marigalante, Guadaloupe, and several

other islands. On his way towards Hayti, where he arrived on the 21st of November, he discovered Porto Rico. He sailed along the coast of Hayti, and on the 28th arrived at Navidad. He found the fort completely destroyed by fire, and some of the Spaniards lying dead in the neighbourhood. He was informed that, after his departure, they quarrelled, among themselves, about gold and women; that they had been guilty of murdering one another; and, that they also offended the natives, who consequently destroyed the fort.

On ascertaining the full extent of this calamity, which he rightly attributed to the avaricious and immoral conduct of the Spaniards, he sailed eastward; and near Monte Christo, on the north side of Hayti, began building a town, which he named *Isabelica*. Fatigue and care, at sea, and on shore, reduced him to such weakness and sickness, that he was unable to leave the habitation, he lodged in, for some months. Meantime, his mind was not idle. He sent Alonzo de Hojeda into the interior, to the mines of Cibao; and in February, 1494, he despatched twelve of his ships to Spain, under the command of Captain Anthony de Torres, with an account of all that passed, and of his future projects. Hojeda, who had explored a great part of the interior, returned, and gave a glowing account of the mines, and the gold found in the washings of the rivers. Columbus, as soon as he regained his health, explored the country, with an armed escort, leaving his brother Diego in command of the then remaining ships, and to control several of his men, who had conspired to mutiny.

On returning from the interior of Hayti, which he had extensively, and with great satisfaction, explored, he made several wise regulations for the judicious management of the settlement, by a council, which he appointed. He then sailed, in the end of April, in order to explore the western continent: of which he believed Cuba to form a part. On the 29th he reached Cuba, coasted along its shores, then crossed over to Jamaica, where he landed, took possession of that island, and traded with the inhabitants. His men, however, were, as usual, difficult to control; and they had a sharp skirmish with the natives. Columbus, having previously brought the latter to a peaceable understanding, left Jamaica on the 15th of May. He was more than once nearly shipwrecked, among the shoals; and, during violent storms, off the coast of Cuba: a great extent of which he explored. He was forced back to Jamaica, coasted its northern shores, encountered contrary winds, with leaky ships; and, after a tedious voyage, reached *Isabelica*, in Hayti, on the 29th of September, where he met his brother Bartholomew, who had arrived from Spain with three ships.

The conduct of the Spaniards, to the natives, during the absence of Columbus, was of the most dishonourable character; while, among each other, envy, hatred, and disorder prevailed. These contentions, Columbus, with the assistance of Bartholomew, finally subdued. But the native caciques, having been provoked by the intolerable aggressions of the Spaniards, had on his return combined against him, under circumstances, which rendered it indispensable for him to reduce them, by force, to obedience.

Father Boyl, and other dissatisfied and jealous persons, had previously returned to Spain; and the foul representations which they made against Columbus, to Ferdinand and Isabella, induced their majesties to send out John Aguado with four ships, and with instructions, to watch over the movements of the admiral. The conduct of Aguado, who assumed much greater powers, than his commission authorised, rendered it necessary for Columbus to return to Europe. He left his brother Bartholomew in command, and arrived in Spain after a most disastrous voyage. He so far overcame the prejudice and suspicion which had been entertained, in consequence of the false charges made by his enemies during his absence, that, after a delay of more than a year, he was enabled to sail on his third voyage, with six ships, from the port of St. Lucar, on the 3rd of February, 1498. He steered by a more southerly course than he did on his former voyages; and, after a long passage, reached the Island of Trinidad, and discovered the continent of America on the 2d of August, 1498. On the 19th he arrived at Hayti. He found that during his absence, one Francis Roldan had induced several men to revolt, and had proceeded with them to another part of the island. Columbus was further mortified by the accounts he received of the many disorders, and the mutinous spirit, which had, generally prevailed during his absence. It was the

misfortune of this great man, that affairs which were prosperous on his departure from Hayti, were replaced by disorder, and a mutinous spirit, during his absence; and that when he was not in Spain, the envy and malice of his enemies, encouraged by the Bishop of Burgos, assailed him, and misrepresented all his actions to the court. Columbus had no sooner sailed on his third voyage, than the representations, and calumnies, caused by jealousy and hatred, against him—partly because he was a foreigner, but chiefly on account of his extraordinary abilities, merit, and success, were so unremittingly brought forward, that they revived the former distrust of the suspicious and cold Ferdinand, and even biassed Isabella so far, that they resolved to send Francis de Bovadilla, or Bobadilla, a needy knight, as judge to Hayti, to inquire into the conduct of Columbus; and with powers, if he were found guilty of the alleged charges, to send him back to Spain.

In August, 1500, the admiral was absent from the seat of government, reducing to obedience and order those, who, before his arrival, had revolted against the Spanish authority. Bobadilla, who arrived in the end of August, took advantage of Columbus being at a distance,—unceremoniously occupied his house; and, appropriating to himself all that it contained, gathered round him the admiral's enemies, and declared himself governor. He then summoned Columbus to appear, in order to be made acquainted with their Catholic Majesties' pleasure.

On the arrival of Columbus at St. Domingo, the capital, he and his brother Diego were subjected to the insults of his enemies; and then, by command of Bobadilla, without further inquiry, put in irons, and sent on ship-board, with orders that no one should speak to them during the voyage, nor until after they were carried, in chains, to Fonseca, the Bishop of Burgos. The ship-master, soon after sailing, offered, on his own responsibility, to release Columbus from his irons; but the latter resolved that he should remain in chains; and be conveyed in that state to Fonseca, his great enemy, as ordered by Bobadilla, who had received his powers from their Catholic Majesties. As for the fetters, he would keep them, as relics, and memorials of services, to be afterwards, by his will, buried with him.

On his arrival at Cadiz, in November, 1500, he wrote to their majesties, in dignified language, acquainting them of his arrival, in chains, from the countries which he had added to their dominions. Ferdinand and Isabella, as has been supposed, became ashamed of their base conduct, in giving way to the Bishop of Burgos, and to other enemies of the admiral, who were envious of his fame and of his success. He received an order for his liberty, with a request to repair to Grenada, where he was received with apparent kindness. Their majesties denied they had ordered any harsh usages, and promised him satisfaction.

Posterity may pardon Isabella, who was, no doubt, imposed on by confessors and courtiers. But the conduct of Ferdinand and Fonseca—the prince and the priest,—will ever merit the hatred and scorn of mankind.

Bobadilla, who by his avarice, baseness, and partiality, had nearly ruined the affairs of Spain at Hayti, was superseded by Don Nicolas de Obando, who was reputed a wise and judicious personage,—but who, in St. Domingo, proved a crafty, dark, cruel, and revengeful monster.

During the following year, Columbus sailed on his last voyage from Spain.

On his arrival at St. Domingo he was refused admittance by Obando, the governor; although the admiral pleaded that the aspect and signs of the weather portended a great storm; and, that it would be dangerous for him to put again to sea. He warned the governor not to allow a fleet of eighteen ships, then with their cargoes ready, to proceed to Spain for eight days, by which time the storm would pass over; but his advice, grounded on his experience, was disregarded. The fleet sailed; a violent hurricane came on soon after. Bobadilla, the former governor, with his wealth; Roldan, who formerly revolted against Columbus, and several others, were on board. Fifteen ships, including that which carried Bobadilla, Roldan, and others, sent back by Obando, perished with all on board. Three only reached Spain: of which one was that which carried all that remained of the admiral's property. His own vessels, by skilful seamanship, weathered the hurricane. This good fortune, and the arrival of the vessel, in which was

laden his effects, was ascribed by his enemies to the powers of sorcery, with which they charged him.

Columbus, on leaving St. Domingo, proceeded westward, to the coast of America; explored it from Cape Honduras to Cape *Gracios a Dios*; and thence south, trading with the natives, to Porto Bello, Nombre de Dios, and Darien. He sent his brother some distance into the interior, from whence he returned with a considerable quantity of gold, which he received in exchange for European articles. He attempted to form a settlement, but was repulsed by the Aborigines. His ships were become nearly unable to float, from being worm-eaten, and otherwise shattered. His crew became mutinous; and he with difficulty reached Jamaica, where he ran his vessels (two out of four only remaining) ashore. He sent messengers, in a canoe, to Hayti, begging to be relieved; and after remaining many months, with his mutinous crew, he was finally carried to Hayti, and thence to Spain; where, persecuted by the envy of his enemies, and neglected by an ungrateful monarch, he died at Valladolid on the 20th of May, 1506, aged fifty-eight years. His body was deposited, first at Valladolid; six years after it was buried at Seville; and, in 1536, removed to St. Domingo: from whence, 260 years afterwards, in 1796, after the Spaniards lost that city, they carried away his coffin, with some remains,* and entombed them in the cathedral at Havaña.

It is impossible to say, what would have been the probable consequences to the British empire, if Henry VII. had not delayed to accept the proposal of Columbus, until after they were, unknown to Henry, or even to Bartholomew Columbus, accepted by Ferdinand and Isabella. That Columbus, himself, would have been so ungratefully treated, in England, is not probable; yet Sebastian Cabot, notwithstanding the important discoveries which he made, was afterwards left unemployed, and entered the service of Spain.

The merit of discovering the continent of the New World, was attempted to be denied to Columbus; and so far with success, that an able, unprincipled, adventurer, with whom Fonseca, an unforgiving bishop, conspired, obtained by forgery and mis-statements, the credit, for some time, of being the original discoverer, and had, in consequence, his name given to all the vast regions of the West.

Columbus discovered the continent of America in August, 1498; whereas, Alonzo Hojeda (one of the former companions of Columbus) and Americo Vespucci, did not sail, on their first voyage, from Cadiz until the 20th of May, 1499. Americo made skilful use of the admiral's maps and charts, which the Bishop of Burgos put, from hatred to Columbus, into his hands; and to whom the bishop gave also clandestine licences, in contravention of the authority held by Columbus from Ferdinand and Isabella.

CHAPTER III.

DISCOVERIES CONTINUED—TORRES DE PINCON—VESPUCCI—BASTIDAS—CARTHAGENA—PONCE DE LEON CONQUERS PORTO RICO, AND DISCOVERS FLORIDA—CONQUEST OF CUBA—JAMAICA—NUNEZ DE BALBAO DISCOVERS THE PACIFIC.

THE passion for discovering unknown countries, inspired by the success of the projects, which the great mind of Columbus conceived, and planned, and which his persevering character accomplished, became soon the mania of the age.

The principal man among the adventurers of that period, was not Americo Vespucci, but Vincent Torres de Pincon, who commanded one of the ships during the first voyage of Columbus. He was an able seaman, of liberal education, great courage, and of such ample fortune, as to enable him to fit out four stout ships, at his own expense, with which he sailed in January, 1500, on a voyage of discovery. He was the first Spanish subject,

* It is doubtful if this coffin contained the bones of the great discoverer.

who crossed the equinoctial line, and discovered the country of Santa Cruz, or the Holy Cross, and the river Marañon, or Amazon, in Brazil. He did not succeed in persuading the natives to trade with him. He returned north to the river Orinoco, which was discovered previously by Columbus. He soon after encountered a great storm, lost two of his ships, before he reached Hayti, and finally arrived safely in Spain.

In 1501, Roderic de Bastidas fitted out, at his own expense, two ships; and sailing from Cadiz, he discovered the country since then called Carthagera, and Magdalenna, and about 100 leagues more of the coast of America than was known to Columbus. He opened an intercourse with the natives, brought some of them away, and proceeded to Hayti. So jealous were the Spaniards of each other, that Bastidas was imprisoned for the success of his enterprise.

St. Juan de Porto Rico, called Borriquen by the natives, was discovered by Columbus, in 1493, but neglected until 1509, when Juan Ponce de Leon, an enterprising, ambitious, and tyrannical nobleman, was informed that gold was abundant in that island. He crossed over from Hayti, and was received kindly by the principal cacique and by the natives; who showed him the streams which carried down great quantities of gold, with the sands and washings, from the mountains. On returning to Hayti, he managed to obtain a commission, from Spain, for conquering Porto Rico; and was, on landing, received by the natives, who believed the Spaniards to be immortal, or they would, from their superior numbers; and, with their poisoned arrows, as was their manner of defending themselves against the Caribbeans, probably, on the attempt of Ponce de Leon to subdue them, have driven back the Spaniards with great loss of life. The natives believed the Spaniards invulnerable, and they submitted to labour and to slavery, until a young Spaniard, on being carried across the ford of a river, on the shoulders of a native, of more than usual boldness, was thrown off by the latter, who, with the assistance of other natives, kept the Spaniard under water until he was drowned. They then dragged him ashore, and, doubting whether he was dead, the Indians cried out, asking pardon for the accident, during three days, until the body became so putrid, as to remove all their doubts. The natives being now convinced that the Spaniards could be killed, rose upon, and slaughtered more than one hundred of, their oppressors. Ponce de Leon finally succeeded in reducing the whole island to his authority, and the natives to slavery in the mines; in which, and under other cruelties, they became extinct in a short period.

Diego Velasquez sailed from Hayti, in November, 1511, to conquer Cuba; which he accomplished, after committing the most horrible atrocities. Ponce de Leon, who had been degraded and deprived of his authority in Porto Rico, where he accumulated great wealth, had grown old, but his ambition, and his adventurous spirit, were unsubdued. He had often heard from the natives that there was, in a distant western country, a fountain named *Bimini*, the virtues of which, when bathed in, renewed the youth and the strength of the old and the feeble. He mourned when he reflected that the probable duration of his life was far too short to enable him to make great discoveries and conquests. He believed there was still a third world to be found,—that he only wanted length of life and bodily strength to become a greater discoverer than Columbus, and a greater conqueror than Julius Cæsar. These ambitious thoughts, and his being reduced in Porto Rico to the condition of a private subject, caused the proud De Leon to become a melancholy man.

He sailed, with two strong, well-manned ships, on the 1st of March, 1512, from Porto Rico; and, passing westward, among the Lucayan islands, discovered Florida and the Bahama channel; landed at several places, and had skirmishes with the natives, who were a much bolder race than any of the insular aborigines. But he discovered no fountain of life, and he returned to Porto Rico, convinced that he was older and weaker than when he departed.

Attempts were made at this period to conquer and settle on the coast of Carthagera and Darien.

In 1509, John de Esquibel was sent by Diego Columbus from St. Domingo to form the first settlement in Jamaica, to which Alonzo de Hojeda laid a claim, and threatened to hang Esquibel.

During the following year Hojeda and John de la Cosas, who had received a licence to capture and take possession of Veragua, Carthagena, and other western countries, sailed from St. Domingo, landed on the continent, and had several conflicts with the natives, who were a bolder and more advanced race than the aborigines of Hayti. In one attack seventy Spaniards were killed, and the remainder wounded with poisoned arrows. Hojeda and Cosas were saved by the arrival of another adventurer, Nicuesa, with four ships. The latter attacked the natives, burnt their town, in which they found a large store of gold, and taking a number of prisoners, sent them as slaves to work in the mines of Hayti. Among the commanders of these vessels was Francis Pizarro, whom Hojeda left at St. Sebastian, the place where he fixed upon for a settlement. The latter entered into an agreement with an outlaw, or pirate, to take him in his vessel to St. Domingo. The pirate's vessel was wrecked on the coast of Cuba; from whence they escaped to Jamaica in a canoe. The pirate was there apprehended and hanged. Pizarro was obliged to leave St. Sebastian, and escaped with a few men to Carthagena,—where Enciso, with two ships, arrived from St. Domingo. Pizarro and Enciso then proceeded to St. Sebastian, where they were shipwrecked, and on landing found the place entirely destroyed by the natives. They saved from the wrecks, provisions, arms, and various articles, and proceeded to re-establish themselves at St. Sebastian, but they were reduced to great extremities by the attacks of the natives, and by the scanty supply of food.

One of the most remarkable men among the explorers of America accompanied this expedition. This person was Vasquez Nunez de Balbao, a man of good family, who had formerly sailed with Bastidas on his voyage of discovery. He had obtained a settlement at Hayti, but having been accused of some excesses, for which he was to have been executed, he escaped, by being concealed on board Enico's ship in a bread-cask. He ventured after a day to make his appearance. Enciso was enraged, as he had been warned not to take any one, but those on his muster-roll, from Hayti; but the principal persons on board interceded for Nunez, and he was consequently protected. He was afterwards almost the only person at St. Sebastian who had not absolutely given themselves up to despair. Enciso was rallied and encouraged by Nunez, by whose energy the stranded vessels were at last got afloat, and they sailed, according to the advice of Nunez, to where he had seen a town, when he had made the voyage with Bastidas. They accordingly steered for the River Darien, and found the place and country, such as both were described by Nunez. They marched against the cacique and his people, attacked and put them to flight,—found in the town, which was immediately deserted, abundance of provisions, also cotton spun and unspun, household goods of various kinds, and more than the value of 10,000 pieces of eight in gold plates. The success of this adventure being justly attributed to Nunez, his reputation became great. He deprived Enciso, who bore him no good will from the first, of all authority; gained by his boldness the confidence of the Spaniards, and founded the settlement of St. Maria. Nunez established his authority and retained his power in Darien, and the country then called Castell d'Oro, by gaining over, or defeating the chiefs of the country; by buying with the gold he sent to St. Domingo, the authorities there over to his interest; and by his superior fertility of resources under the most difficult circumstances.

In the middle of September, 1513, having been informed of rich and vast regions to the southwest; stretching along a great ocean, which was not far distant, he departed from St. Maria, accompanied by the afterwards celebrated Francis Pizarro, on an expedition, which, after some desperate conflicts with the natives, advanced so far, on the 25th of September, as to behold, laying broad in view, the great Pacific Ocean.

Nunez possessed the manner and ability of making himself beloved by his companions and followers. He was kind to the sick and the wounded, and shared the same fatigues, and the same food, as the humblest soldier. Before reaching the shores of the Pacific, he was opposed by Chiapes, the cacique of the country; who, however, was soon routed, and several of the natives killed by fire-arms, or torn by blood-hounds, those powerful auxiliaries of the Spanish conquerors in America. Nunez then made peace with them,—exchanging trinkets, of little cost, for gold to the value of four thousand pieces. Pizarro was then sent in advance to view the coast, and two others proceeded,

on different routes, to find the nearest way from the heights to the sea. Nunez followed as soon as he could bring up the sick and wounded. On reaching the shore, he walked, with his armour on, into the sea, until the water reached his middle; and then performed solemnly the ceremony of taking possession, in the name of the crown of Castile, of the ocean which he had discovered.

The Indians provided him with canoes; and contrary to the advice of the natives, he proceeded with about eighty Spaniards, and Chiapes, the cacique, to cross a broad bay. Bad weather came on, and they barely escaped perishing on an island, where several of their canoes were wrecked. On the following day they landed with great difficulty: being opposed by a cacique, whose people, however, were soon put to flight by the fire-arms, and by the dogs of the Spaniards. Nunez soon brought this cacique to terms, and for a few trinkets received a considerable weight of gold, and a great number of large pearls of great value. The different caciques gave him the most flattering accounts of the vast countries, which they described as extending to the south and south-west.

Before attempting further discoveries, he considered it prudent to return from the Pacific, and arrived at St. Maria about the end of January, 1513, with the gold and pearls he had collected, and which he distributed fairly among the soldiers, deducting one-fifth for the king. He immediately sent the king's share of gold and pearls and all his own to Spain by an agent. On arriving at Seville, this agent applied first to the Bishop of Burgos, who was delighted at the sight of the gold and pearls. The bishop sent him to the king, and used all his influence with Ferdinand, who entertained a strong aversion to Nunez de Balbao.

The old king, Ferdinand, who, unlike his deceased consort Isabella, was always jealous of superior men, and especially of discoverers, did not, on this occasion, depart from his former base policy of supplanting the men, who performed the most arduous undertakings, by the worst and most perfidious of his own creatures; such as Obanda and Bobadilla. The Bishop of Burgos had, previous to the arrival of the agent with treasures from Nunez, counselled the king to supersede him by one of the worst characters in Spain. Instead of confirming Nunez de Balbao in the government of the countries he discovered, and annexed to the crown of Castile, Ferdinand appointed Pedro Arias d'Avila, or, as the Spanish writers, by contracting the first name, call him, Pedrarias, governor of Castell d'Oro. He was destitute of all the qualities which constitute a good man of great mind; but haughty and ignorant, he was a master of the arts of oppression, violence, and fraud. He left Spain in April, 1514, with a fleet of fifteen ships, two thousand troops, a bishop, John de Quevedo and numerous greedy and rapacious followers of noble birth; among others, Enciso, the enemy of Nunez. On their arrival at Santa Maria they were received by Nunez with great respect. They found the latter inhabiting a small house, in simple attire, living on the most frugal diet, and drinking no other liquid than water; while he had at the same time, a strong fort, with 450 brave soldiers faithfully attached to him. That he was ambitious, and did severe things to obtain that power which he was never known to abuse, is admitted. His accounts and statements were clear, and he had annexed the country, between the Atlantic and the sea which he had discovered, to the crown of Spain. Pedrarias imprisoned this great man, and sent strong representations against him to Spain.

There were, however, some honest men, among those brought over by Pedrarias, who sent a true account of Nunez to the king; and the latter formally expressed his approbation of the conduct of the late governor, and appointed him lord-lieutenant of the countries of the South Seas; directing also that Pedrarias should act by the advice of his predecessor.

On the king's letters arriving from Spain they were suppressed by Pedrarias; who, in the mean time, by his perfidy and cruel exactions, brought the whole native population into hostility and revolt against the Spaniards. The Bishop Quevedo then interfered, Nunez was liberated, and by his skill and demeanour established tranquillity, and proceeded to the South Sea to build a town, which he in a short time accomplished, and was then recalled by Pedrarias. To the astonishment and horror of all the Spaniards, Nunez was charged with treason by Pedrarias, and publicly beheaded, on the charge that he had

invaded the domains of the crown, merely by cutting down, without the governor's licence, the trees used in erecting the town which he built.

His execution was declared a murder by the Royal Audienza of St. Domingo; yet Pedrarias, whom the Bishop of Chiapa described as the most wicked monster who was ever sent to America, continued for many years, by the king's will, to exercise his cruelty and injustice.

Thus perished Nunez de Balbao, in 1517, at the age of forty-two years, for having served his king with more fidelity than any of the Spanish conquerors; of whom, if we may except Cortez, he was the ablest; and whose character stands far higher than any of those who added new territories to the dominions of Spain.

Pedrarias, after the murder of Nunez, removed to Panama, where he erected a palace. In his hostilities and cruelties to the caciques and the native tribes, he caused great destruction of life; and so ill-judged and planned were his enterprises, that in subduing one cacique, Uracca of the mountains, more Spanish lives were lost than during the whole conquest of Mexico by Cortez.

The only important conquest made under Pedrarias, was by Frances Hernandez, of the territory of Nicaragua, to which the governor immediately repaired to take possession of for himself. Jealous of Hernandez, as he was of Nunez, he charged the former with a design to revolt; which the latter, confident in his innocence, boldly denied. Pedrarias immediately ordered him to be executed: power was to be upheld by the immediate death, according to the maxim of this tyrant, of conquerors who were suspected. For this murder, equally barbarous as that of Nunez, Pedrarias was not called to account.

CHAPTER IV.

DISCOVERY OF MEXICO.—HERNANDEZ DISCOVERS CAMPECHY.—GRIJALVA SAILS TO FLORIDA AND ALONG THE SHORES OF MEXICO.—CORTEZ SAILS FROM CUBA TO CONQUER MEXICO.

IN 1517 Hernandez de Cordova sailed from Havana, by order of Velasquez, to explore countries lying west of Cuba, and discovered Campechy. He was repulsed by the natives, who killed and wounded several of his men. After falling in with Florida, he returned to Cuba, and ten days after, he died of his wounds.

John Grijalva, a man of extraordinary boldness and experience, was despatched by Velasquez, on the following year, in three ships well equipped and armed. He fell in with the coast of Florida, sailed westward along the Mexican Gulf, and named the country New Spain. He was at first boldly repulsed by the natives, who had heard of the atrocities of the Spaniards at St. Domingo. Sixty soldiers and Grijalva were wounded, and three of his men killed. He then sailed farther westward; opened at length, and with much difficulty, a peaceable intercourse with the inhabitants; and exchanged looking-glasses, trinkets, and beads, for plates and other articles of gold. He sailed farther to the bottom of the Gulf, and landed on the territory of Moctezuma: of whose great empire, riches, and power, he obtained the information that gave rise to the expedition which conquered Mexico. Grijalva returned to Cuba with a considerable treasure of gold and some precious stones.

Velasquez, either jealous of Grijalva, or from having injured him on his return, refused, in consequence, to intrust him with the conquest of Mexico. The command of that famous expedition was given to the celebrated Hernandez Cortez: a man of the greatest natural abilities, and one of the most ambitious, unscrupulous, bold, and successful warriors that was ever destined to scourge the human race.

Cortez, who was of noble extraction, was educated at Salamanca, and intended for the legal profession; but, disliking a studious life, he resolved, contrary to the wish of his

parents, to follow the profession of arms. With his father's approbation, he left Spain for St. Domingo in 1504, bringing credentials to his kinsman the governor Obando. On his arrival Obando received him as one of his friends. Hayti being then completely subdued, there was no sphere for military activity in St. Domingo. Cortez soon after became impatient, and solicited and obtained leave from Obando, to serve in the reduction of Cuba under Velasquez. He was admirably constituted, mentally and bodily, for the profession of arms. He had many generous qualities. He was not avaricious, and he had none of the mean vices. He was fluent and agreeable in conversation; and he neither spoke maliciously of others, nor vainly of himself. For gaining the affections of a noble young lady, who afterwards became his wife, he was imprisoned by Velasquez. They became friends, on the latter consenting to the marriage. Cortez, who had acquired high military reputation, was soon after recommended by two friends of the governor, as the most fit person to command the expedition destined for the conquest of Mexico. Velasquez acquiesced, and Cortez received this appointment with expressions of gratitude and respect.

He departed from St. Jago de Cuba, in November, 1518, with a few vessels, and about three hundred soldiers, accompanied by Diego de Ordez, who was a friend of Velasquez, Francisco de Morla, and Bernard Diaz, the historian of the conquest. He sailed first west to the port of Trinidad, to take on board a reinforcement of men, arms, and horses, collected by some friends which Cortez had at that place. Before his arrival at Trinidad, his rivals, who, as such, were his enemies, urged an astrologer to represent to Velasquez that he had ascertained, from the stars, that this expedition would have a *fortunate and unfortunate event*. The governor, though he disclaimed believing in the prognostic, found in it a cause of some uneasiness, not of itself, but in creating suspicions, which led him abruptly to decide on depriving Cortez of the command of the expedition which had sailed. Couriers were immediately despatched, ordering Verdago, the alcalde at Trinidad, to supersede Cortez. The latter obtained accidental intimation of this. He consulted his companions, and they all resolved to stand by him: even to the extremity of taking up arms in his defence. Being confident of the fidelity of his followers, he presented himself immediately before the alcalde; and the latter, from motives of generosity, wrote to Velasquez, supplicating a suspension of the orders he had received. The principal officers who accompanied Cortez did the same. Cortez also wrote complaining of the sudden change in the governor's mind; and sailed along the coast, with his small fleet, which separated from him in the night; his own ship grounding on a shoal near the Isle of Pines. This accident retarded his arrival at the Havana for some days after the other ships, and the delay had nearly ruined the enterprise; but the ability and address which he had displayed in saving his ship, and bringing her with all her equipage and cargo safely into port, added greatly to his reputation. At the Havana several of the principal inhabitants and soldiers joined him. He displayed, while he remained there, great activity; landed his cannon for artillery practice; formed his men into companies; drilled them in military exercises, and in the use of crossbows and fire-arms. He discovered that cotton padded between folds of cloth formed a better defence against arrows than iron armour, and substituted the former for the latter. While thus

actively engaged, the governor of the Havana received orders from Velasquez to deprive Cortez of his command, and to send him a prisoner, under a strong escort, to St. Jago de Cuba. Cortez, who, with his friends, had raised the troops and provided for the expedition, nearly altogether at the sacrifice of their personal fortunes, resolved that this second attempt of Velasquez was not to be endured. On the pretence of procuring provisions, he despatched a vessel for Guanicanico, under the command of the only man he distrusted, Diego d'Ordaz, the confidant of Velasquez. He then gained over the governor of the Havana, who declared publicly he would not execute the unprovoked, and unjust, orders of Velasquez. Cortez then, in the event of the vessels separating at sea, drew up instructions for his officers, and the commanders of each of the eighteen vessels which composed his fleet; and, giving their patron, *St. Peter*, as the final word of command, sailed from the Havana, on the 19th February, 1519; and, after encountering a storm, and being afterwards joined by Ordaz, and, landing on an island near Yucatan, he finally reached that part of the coast and the river formerly visited by Grijalva. He endeavoured to enter the river peaceably, but the natives refused permission; and advancing closely in their canoes, and on the banks, attacked the ships, but were soon repulsed by the Spanish artillery and fire-arms, and their town, Tabasco, was stormed and taken in a few hours. Some skirmishes followed, and some days after, the caciques of the surrounding country, having resolved to collect all their warriors, assembled with the determination of destroying the Spaniards before they could advance further into the country. They advanced in countless numbers upon Cortez; a desperate fight followed; and the Spanish artillery caused great havoc among the undisciplined, bold, furious, native masses. Cortez, leading on his cavalry, cut and trod down all before him; and after leaving about 800 dead behind them, the natives fled with greater celerity than they advanced. Two Spaniards only were killed, and about seventy were wounded. Cortez treated the prisoners with mildness; and telling them, when they expected to be put to death, by excruciating torture, that his only wish was peace and friendship, he set them at liberty.

Having concluded peace with the caciques, and having received provisions and other articles from them, he sailed westward the day after Palm Sunday. The chief cacique, on his departure, pressed upon Cortez to receive twenty Indian women, whom he said were excellent cooks. In a short time the fleet arrived at the port of St. John d'Ulloa. Here some large canoes approached the ships without any fear; but, to the great perplexity of the Spaniards, they spoke in a language not understood by their interpreter, Aguilar.

Among the women received from the cacique of Tabasco, there was one who spoke both the language of that place,—being the same as that which Aguilar understood, and also the language of the people among whom Cortez now ar-

rived. He chose her for his mistress, and called her Donna Marina. She was said to be the daughter of the Mexican cacique of Guazacoalco. By some unfortunate circumstance she fell into the hands of the cacique of Tabasco and became his slave. Until she learned Spanish, Cortez, by the double channel of communication of Aguilar and Donna Marina, conducted his discourses with the Mexicans.

He was soon informed of the great power, wealth, and extensive empire of Moctezuma, and sent the messengers, who came to him from the neighbouring caciques, away well pleased with various trinkets. On Good Friday he gave orders for landing the horses and artillery, and commenced erecting sheds to shelter his people from the sun, and surrounded them with fascines. He was even assisted in these works, and supplied with provisions, by Teutile, a neighbouring cacique. Cortez, in the meantime, disposed of his artillery so as to command the surrounding approaches to his encampment. Having erected a temporary chapel, on the altar of which he erected the cross, and an image of the Virgin, he celebrated Easter with great pomp. On all occasions he observed strictly the ceremonies of the church. On the same day, after mass, the two caciques, Teutile and Pelpatoe, were received by him with stately magnificence. They made him presents of cloths, provisions, and a box containing gold; but when he told them he must, as the ambassador of the great Emperor of the East, Charles of Austria and Spain, have a personal interview with the Emperor Moctezuma, and that he must proceed to Mexico, in order to fulfil his mission, they were utterly dismayed.

They said they were but the slaves of Moctezuma; that they would be sacrificed if they allowed him to proceed to the imperial city; and they entreated him not to undertake his journey until permission was obtained from the emperor. They offered him, in the meantime, plentiful supplies of provisions. The Mexican chiefs brought with them painters, who drew on pressed cotton cloth, figures of the Spanish troops, ships, artillery, and horses, for the purpose of sending these drawings to Mexico, for the information of Moctezuma. In order that they might introduce into their pictures some idea of the Spaniards in action, he caused his cavalry and artillery to have a sham fight. The Mexicans were by this display both confused and astonished.

Accounts were then despatched to Moctezuma; and the messengers returned with presents carried by about a hundred Mexicans, consisting of large plates of gold and silver, representing the sun and moon; and many other valuable articles of gold, silver, precious stones, fine cotton, Mexican arms, and curiosities; but with the information that the unknown strangers could not possibly be received by the emperor. Cortez however persisted, notwithstanding the small number of his forces, and the great extent, power, and population of the Mexican empire. Moctezuma, who was the eleventh emperor, was famed, before he succeeded to power, for his bravery, and afterwards for his despotism, and the heavy taxes to

which he subjected the Mexicans. He had reigned fourteen years when Cortez arrived, and Tlascala and two other provinces, were the only countries of Mexico which were not under his subjection. The messengers returned a second time with presents from Mexico, but Moctezuma not only refused permission for Cortez to proceed, but the caciques assumed a haughty demeanour. They retreated suddenly with their people, and no longer supplied the Spaniards with provisions: hoping to expel them from the country by starvation. Several discontented Spaniards, headed by Ordaz, the confidant of Velasquez, insisted on returning to Cuba. Cortez, with his usual ability and address, not only calmed the discontented, but having managed to receive the promise of alliance from the Zempoallans, a powerful nation, he removed to a more convenient harbour, where he arranged matters in order to form a settlement, which, from the richness of the surrounding country, he called Villa Rica de la Vera Cruz, *The Rich City of the True Cross*. He appointed alcaldes, regidores, and other municipal officers. These magistrates formed a council, among whom he appeared as a private person; laid before them the commission he had received from Velasquez and his truncheon: and delivering both to the alcalde, resigned, and left for his barrack.

They accepted his resignation, but immediately elected him commander-in-chief; giving him his commission in the name of the King of Spain. Ordaz, Pedro el Escudero, and Velasquez de Leon, having attempted to produce discontent, he arrested them for sedition, and sent them in irons on shipboard. He then sent Alvarado, with a hundred men, to view the interior country, and to collect provisions. The inhabitants fled before them to the woods, leaving their habitations with all they contained. Alvarado disturbed nothing, except taking back such provisions as he found to the head quarters. Cortez then directed his march to Zempoalla, sending before him an exploring party. He directed the ships at the same time to sail north to the Bay of Quilabíslan. On his approaching Zempoalla, he found the villages not only deserted, but the houses without either furniture or provisions. On passing an extensive meadow he was met by Indians, with presents from the cacique of Zempoalla, and an invitation to visit him. The buildings of this large town, situated between two rivers, were of stone, covered with a fine white stucco. It was intersected by streets, with several squares; which, as Cortez entered, were crowded with inhabitants. The cacique, who was so enormously fat that he could not walk, came out, supported by his attendants, to welcome Cortez. He received the Spaniards with hospitality and confidence; supplied them with provisions, and allotted to them the best quarters in the town. He made a present at the same time to Cortez of jewels, gold, and various curiosities.

At the next interview, when the cacique and Cortez met in full state, the latter drew the former to speak of his position in relation to Moctezuma. The cacique, after some time, and in great dejection, informed Cortez that all the

neighbouring caciques, and himself, were little more than slaves under the tyranny and power of the great Moctezuma; that they had neither the ability nor courage, to think of rendering themselves independent,—and that, in despair, they all submitted to the despot of Mexico: who expected to be considered more like a god than an emperor. Cortez promised, if the caciques stood by him, he would relieve them from their degrading bondage to Moctezuma. Having animated, and gained over, the cacique of Zempoalla, who provided him with all necessities, and with four hundred men to carry forward his artillery and heavy luggage, he marched forward to a town called Quilabíslan, which he entered without opposition: the cacique having retired to some distance, and nearly all the inhabitants having fled. The latter, on their being assured of kind treatment from Cortez, returned; and, soon after, the cacique, accompanied by the cacique of Zempoalla, both carried on a sort of palankin on men's shoulders, returned to the town. They complained of the cruelties of Moctezuma, and offered Cortez their aid and friendship. Meantime the town, the people, and the caciques, were surprised by the arrival of six commissioners from Moctezuma, who passed Cortez with looks and gestures of indignation, rather than of respect. They summoned the caciques before them, and reprimanded them publicly, for admitting Cortez, and demanded of them twenty of their people, to be sacrificed as an atonement to the Mexican gods. Cortez prohibited the caciques to accede to this tyrannical demand; and ordered them, authoritatively, to seize the commissioners: which order the caciques, finally, with reluctance and fear, executed. The commissioners were imprisoned, and placed in a sort of pillory, by the caciques, who now wished to kill them. Cortez released two of them at night,—directed them to proceed, without delay, to Moctezuma,—and to acquaint him that the sovereign of Spain only required peace and friendship with the sovereign of Mexico. He sent the four other commissioners to where his ships lay, and ordered them to be taken on board and treated with kindness and respect. He managed, also, to gain, with incredible rapidity, the confidence of the people among whom he came; and, in a short time, the fame of his power, and humanity, spread in all directions over the country. Thirty caciques, who had but lately submitted to Moctezuma, came to Cortez from the mountainous regions; and, offering him aid against the Mexican emperor, swore allegiance to the King of Spain. The different caciques afforded, also, all the assistance that Cortez required for building the town at Villa Rica de la Vera Cruz: the site for which he chose, not where he first erected a temporary town, but in a more convenient and fertile situation; situated in a plain between Quilabíslan and the sea, and having the advantage of good water.

Moctezuma, indignant at these proceedings, resolved not only to march against the caciques to punish them for their conduct, but also to exterminate the audacious Spaniards, who had presumed to treat him, and his supposed uncon-

querable power, with disrespect. The two commissioners who had been liberated by Cortez arrived in a few days at Mexico. Their representations, true or exaggerated, changed the warlike preparations of Moctezuma into peaceful overtures. He sent to Cortez a new embassy, consisting of the emperor's two nephews and four others, to prevail upon him not to approach the city of Mexico. This embassy carried a rich present, and reached Cortez about the time that he had completed his fortress, church, and various buildings for lodging his troops, and depositing their arms, ammunition, and other stores, at Villa Rica.

Cortez heard, with courteous patience, the representations made by the embassy. They said Moctezuma had, in respect to Cortez, changed his resolution of punishing the caciques, or visiting them with the justice of his vengeance; but that the obstacles to the Spaniards visiting the capital, or seeing the emperor, were insurmountable. Cortez replied, that he thanked the emperor, with the utmost respect, for his present; but that no difficulty could discourage him in fulfilling the mission intrusted to him by his great master, Don Carlos, of Austria and Spain.

He, therefore, regardless of the protestations of the ambassadors of Moctezuma, collected his forces; promised to defend the caciques, whose warriors joined him in great numbers; and having prepared all that was necessary to carry on this daring expedition, he left Villa Rica de la Vera Cruz, to prepare other places for his march to Mexico. The cacique of Zempoalla provided him with about two thousand men, armed in the Indian manner. These troops, for some time, rather embarrassed than aided him, from their desire to pillage one of the towns before he reached it with his small army. Before his final departure, he sent two ships to Spain with despatches to Charles the Fifth, describing the country, and all that he had accomplished; and he sent, also, such gold and treasure as he could to the king: directing his agents, on their arrival in Spain, to acquaint his majesty with his position, and all that he had endured and overcome. He also instructed those delegated on this mission, to avoid St. Jago de Cuba; but they could not forbear touching at the Havana, and were the first to return to Spain by the Bahama channel. Attempts at conspiracy, and to return to Cuba, by seizing on one of the ships at night, being attempted by the alguizil and another, Cortez caused them both to be hanged. He then resolved on an act so desperate, that it could only have been conceived by the most fertile and judicious, and executed by the most bold, mind. In order to prevent conspirators, or dissatisfied persons, prevailing over any portion of his forces to return to Cuba, he managed to obtain the consent of those most attached to him, and who were, fortunately, the most numerous, to his proposal of destroying the fleet at Villa Rica. This act, which, on the part of a less able general would have proved a deed of insanity, was decided upon, and almost

immediately executed,—the anchors, sails, and various materials were landed, and the ships scuttled, sunk, or burnt. The old sailors he left at Villa Rica. The able-bodied seamen he added to his forces.

Cortez had not advanced far on his march, when he received intelligence, that a small squadron from Cuba appeared off the coast; and, evidently, to interfere with his progress. He marched back with some troops to Villa Rica, and, by stratagem, he compelled the principal ship to depart: the others also disappeared. Cortez resumed his march to invade Mexico; and passed with his auxiliaries through several towns, in each of which he erected crosses, and performed religious ceremonies. Having entered Zocotlan, a city with thirteen temples, which was subject to Moctezuma, and who had then 5000 troops there, the cacique declared that he was the humble slave of the Mexican emperor, and would obey no commands but those of his master. He was for some days slow in giving any provisions to the Spaniards; but he soon became hospitable, and even presented Cortez with rich presents. He advised Cortez to pass by way of Cholula to Mexico. The Zempoallans opposed this advice, on the ground that the Cholulans were treacherous to strangers, and attached to Moctezuma; while the Tlascalans, who were a faithful nation, were his enemies. Cortez then advanced towards Tlascala, and sent messengers before him to offer alliance and peace. An attempt was made by the rulers of that place to oppose him; and his people were attacked by the Otomies, whom the Tlascalans employed, but afterwards disclaimed, on their being defeated with great loss of life. Cortez lost two horses in the engagement. The Tlascalans then invited him to their city, towards which he marched next day. On his way he discovered the perfidy of the rulers of that nation. His Zempoallan messengers had been arrested by the Tlascalans, and condemned to be sacrificed to their gods, and saved their lives only by being enabled to release each other and fly. Cortez met about 10,000 Tlascalans on a hill near a difficult pass. He invited them to peace, but as they uttered defiance, he attacked them, and they soon gave way. He then pursued them; they suddenly disappeared; and he found himself and his forces surrounded, among low hills, by an ambuscade, according to De Solis and others, of 30,000 men. His situation appeared irretrievable, but his resources, and power of command, roused all the valorous spirit and energy of his followers. A battle of extraordinary skill, and desperate bravery, in which he was met with furious disregard of life by the Tlascalans, enabled him to extricate his forces from the difficult pass and its defiles, and to gain the plain. His artillery and cavalry having then space to charge and fire, he soon routed the Tlascalans with great destruction of life. Some Spaniards were wounded, but none killed in this hazardous action. Some skirmishing fights, and the destruction of small towns, and taking several hundred prisoners by the Spaniards, followed. An army, said to amount to 150,000 men, appeared soon after, in order at once

to exterminate the Spaniards, and to offer those of them and of their allies, taken alive, as sacrifices to the God of Victory. In derision of the Spanish and Zempoallæn power, Xicotencatl, the Tlascalan general, sent 100 turkeys and 200 baskets of bread to Cortez, for the purpose of sustaining his men until they were killed or made prisoners.

Xicotencatl then ordered 2000 men to advance and take the Spaniards. The latter charged with their horses and some artillery, and destroyed, or made prisoners of, most of those who attacked them. Xicotencatl then advanced with all his forces, and attacked the Spaniards with undisciplined and furious courage. The battle lasted for about four hours; the Tlascalans retreated with great loss of life, and many wounded; and discovered that their weapons were unfit to kill a single Spaniard. On the following day, Cortez burnt several villages, and another battle, which lasted about five hours, was fought. The Spanish horse and artillery caused great destruction wherever they charged the undisciplined masses. The Tlascalans retreated before night, and sent messages next day with fair promises to Cortez. They still kept in an aggressive attitude, and attacked him again with about 30,000 men; whom he repulsed, with greater slaughter than in the two former battles. Several attempts were then made by the Tlascalans, to bring Cortez into a belief of security by promises, and by sending presents to him. He was undeceived by his Zempoallan allies, and he followed up his victories, by a succession of brilliant attacks, until he came before the city of Tlascala. Some skirmishes then took place; and ambassadors with presents from Moctezuma arrived acknowledging his friendship, but with a request that Cortez would not march to Mexico. The Tlascalans, at the same time, sent Xicotencatl, their old cacique, from the town to mediate with Cortez, and a treaty of peace and alliance was concluded. Meantime one of the messengers of Moctezuma to Cortez, who had gone to Mexico, returned in six days with rich presents. Cortez then entered the city of Tlascala, where he took up his quarters with his troops, and was, according to his historians Diaz and Solis, presented with 300 beautiful young women, who were destined to have been sacrificed to propitiate the evil god. The Tlascala women, if the Spanish historians are to be credited, became so attached to the Spaniards, that those ladies were afterwards the most ardent friends of Cortez and his followers. Xicotencatl gave his fairest daughter to Peter Alverado; and the whole nation of Tlascala, soon after, united with Cortez, in an alliance against Moctezuma. Cortez now prepared to march with his forces and allies towards Mexico, by way of Cholula. The inhabitants of that place met him with bread, fowls, and other articles; and he entered the town without resistance; but he soon discovered their insincerity, and that they had made preparations to cut him and his forces off. He, in consequence, arrested their chiefs and priests; put about 6000 of their men to death; saved their women; and destroyed

a great part of the town. He gave all the plunder, except the gold, to the Tlascalans. He then liberated the Cholula chiefs, whom he had arrested, and ordered them to sue for friendship, and ally themselves with the Tlascalans. Moctezuma, in the meantime, contrived to send the most costly presents to Cortez; and, on hearing of his victories, believed him invincible, and no longer persisted in refusing to receive him at Mexico. This degenerate emperor, meanwhile, shut himself up in a temple, sacrificing daily a great number of human victims; hoping to allure and appease the evil spirit of his dynasty.

CHAPTER V.

CONQUEST OF MEXICO CONTINUED.—THE AZTECS OR MEXICANOS.—THEIR GOVERNMENT AND RELIGION.—MOCTEZUMA CONFINED BY CORTEZ.—PROGRESS OF THE WAR.—DEATH OF MOCTEZUMA.—HIS SUCCESSOR, GUATIMOZIN, TAKEN PRISONER, AND FINAL SURRENDER OF MEXICO.

THE ancient *Mexicanos* were descendants of the *Aztecas*, who had migrated from a northerly kingdom called Aztlán: they assumed the name of *Mexicos*, from *Mexictl*, that of their chief idol or god; and they are said to have wandered for about fifty years before they finally settled on the islands of lake Tenochtitlan.

Having become a stationary, instead of a nomade, people, their numbers from that period increased rapidly. Their first government was an oligarchy. They afterwards elected a king, and formed the Mexican empire. The Aztecs were of a darker colour than the other aborigines; and lived under a system of civil and political order for a long time previous to the arrival of the Spaniards. They were idolators, and worshipped a plurality of good and evil deities, to whom they offered up sacrifices of human blood.

The Mexican government was monarchical. Its absolute head was the king or emperor, who had a council of revenue, which took cognizance of the expenses of the royal palace, and to which the collectors of the tributes in the different provinces rendered their accounts, and paid the tributes;—a court of justice, in which was vested the nomination of inferior tribunals; a council of war, which took charge of the organization and maintenance of the army; a council of state, which generally, but not always, deliberated in the emperor's presence; also judges of commerce, and of supplies; and administrators of police. The judgments were summary and verbal; the plaintiff and defendant, with their witnesses, stated their respective cases, and the cause was decided. They had no written laws, but they were governed by traditional ordinances, except in cases where the monarch interfered. They were strictly attentive to rewards

and punishments: holding as capital crimes, theft, homicide, and adultery; also transgressions against the king or religion, however trifling: many other crimes were with little difficulty pardoned.

Any breach of faith amongst the emperor's ministers was liable to be punished with death; and no pardon, on proof of such charge, was ever granted.

The general education of youth was provided for in public schools, and in special colleges for the nobility. They were taught a mode of writing which consisted of certain characters and figures, which made them learn, by heart, historical rhymes or songs, which narrated the exploits of their ancestors, and repeated the praises of their deities; they were also taught athletic exercises; and they afterwards assumed places either in the civil service, in the army, or in the priesthood, which were the three great professions.

The girls of rank were brought up in special schools, under the care of matrons: they were kept closely confined from their earliest infancy, and taught all that was considered accomplishments.

The progress they made in civilisation, or, more properly speaking, in knowledge and virtue, was probably greater than among any other of the aboriginal nations of America, if we except the Peruvians. According to La Place, their knowledge of the length of the year, and their intercalation at the end of their great cycle of 104 years, were almost perfectly accurate; and more so than the calculations of the Romans, Greeks, or Egyptians. Their writings were painted hieroglyphics, representing events, rather than expressing ideas. Their maps were tolerably accurate delineations of the country. They built towns, but their architecture was rude, and destitute of beauty; though many of the edifices, and the pyramids, they erected, were large structures. They made roads and dug canals. The emperors and the chiefs had flower-gardens, and flowers were considered amongst precious luxuries. Their knowledge of agriculture was rude and limited to a kind of spade culture, and chiefly to raising maize for food. They had established markets, and the interchange of commodities, and the business of dealers, was regulated by laws; but money, or coins to represent values, were unknown. Their trade was mere barter. They had a feudal system—a civil and military hierarchy; under which the bulk of the people were held in poverty and servility, if not as slaves. Slavery was also legalized, and all the lands belonged to the emperor, or, to the nobles and priests. They understood the art of founding and working gold and silver, and the weaving or making of cotton cloth, and making ornaments of feathers. They knew, like all the aborigines of America, how to construct canoes; but they were ignorant of the use of iron, without which no people ever made great advances in agriculture, or in other arts or sciences; and without which no nation ever became formidable in war. To the inefficiency of their warlike weapons, we must ascribe the successive victories of Cortez, and the final subjugation of the Mexicans.

The Mexicans are described as having no barbarous customs, except in the superstitious ceremonies and rites of their religion. Among these rites, the immolation of human beings, whom the priests sacrificed to their gods, was the most horrible. Were not the auto-da-fés—the victims of the inquisition in Spain and Portugal,—the St. Bartolomews and Dragonades in France,—the burning of heretics in England and other countries, either religious sacrifices, or political murders?

It has been supposed that offering human victims, as sacrifices to their gods, by the Aztecs, originated at a period when their weakness rendered it expedient to destroy the prisoners whom they captured in war. That from not having prisons, it was impossible to retain them alive as captives; and that the danger of allowing them to escape, rendered it politic to destroy them. That, to avoid the charge of mere cruelty, instead of putting them to death, as prisoners, they were offered as victims to the gods; and, that a practice which originated in policy, had, in time, become familiar to, and interwoven with, the fears, faith, and superstitions of the nation: and, consequently, an element of awful authority, too efficient to be abandoned, in maintaining the power of the priests:

The abuses which have crept into the religions of the ancient world, and which superstition, and credulity, and priestcraft have consecrated; and for attempting to reform which, such men as Savonarola, John Huss, Jerome of Prague, Servetus, and many thousands have been burnt, or otherwise murdered, had all, probably, their political origin.

The Mexican priests were the monsters of the nation;—the tyrants who made the most horrible abuse of the abominable worship which they had imposed, from age to age, upon the natural credulity of the human mind. They acknowledged one supreme God,—a future existence, with its rewards and penalties; they also invoked, worshipped, and erected temples, to numerous subaltern deities, each of whom was believed to exercise his special good or evil function. Pilgrimages, processions, and gifts to the priests and temples, were among the good works which were acceptable to their deities.

A slave was chosen annually, shut up in the great temple, worshipped, invoked, incense offered him, and then strangled. Another superstition was, composing a large statue of maize paste, which, on being baked, was placed as an idol, or deity, on the great altar; worshipped, and afterwards cut up by the priests, who gave a small piece to each of the assembled multitude, who believed themselves sanctified by swallowing a part of the idol. Raynal observes, “It is better to eat false gods than real men;” and the Spanish historians accuse the priests of eating the prisoners of war, who were sacrificed; and that parts were sent, for the same purpose, to the emperor and the principal chiefs. When peace lasted so long that there were no prisoners to be sacrificed, the priests represented to the emperor that the gods were dying with hunger, and

war was then made for the sole object of capturing victims for the sacrificial rites. In every respect the Mexican worship was atrocious and terrible : it held the human mind in terror, reconciled the heart to inhumanity, and rendered the priests all-powerful.

Many writers have endeavoured to prove that not only the Mexicans but all the aboriginal nations of America were of Asiatic, and especially of Mongolian, descent. Others, more absurdly, (one of whom lately), have endeavoured to bring forward evidence of their being of Israelitish origin. The latter is evidently neither probable, nor likely possible : for the Hebrews, if we even go back to Tubal Cain, knew the use of iron ; they were also a pastoral race, of which the scriptural history of Abraham affords proof, before they were Israelites : they also ate wheaten bread. None of the aborigines of America, from Hudson's Bay to Patagonia, knew the use of iron, or drank milk, or ate wheaten bread : although the mineral, vegetable, and animal kingdoms of America enabled them to use all these articles, which are now classed among their first necessities. If they were of Mongolian extraction, they must have left Asia before the Asiatics knew the use of the plough, iron, milk, or wheaten bread.

Cortez, in disregard of many subterfuges on the part of the Mexicans, marched steadily forward, through various passes, plains, villages, and towns, until he reached Iztapalapa, within five or six miles of Mexico. He next day entered that city, and Moctezuma came out to receive him. They exchanged presents. Cortez putting round the emperor's neck a collar of sparkling glass brilliants, of various colours, and of little value. Moctezuma, in return, presented him with valuable articles of gold, silver, and featherwork. Harmony prevailed for several days. An attack made by some Mexican allies upon some Zempoallans, whom Juan de Esculante, the governor at Vera Cruz, assisted to repel, founded grounds for a rupture with Moctezuma. Esculante defeated the Mexican auxiliaries, but was so severely wounded that he died a few days after ; and a Spanish soldier, who was made prisoner, died on his way to Mexico, also of his wounds. His head was sent to Moctezuma. Cortez, in consequence of this catastrophe, and from information he received that a conspiracy was forming in the city against him, resolved to seize on the person of Moctezuma. He called his council together, communicated his decision, arranged his plans for the purpose, and proceeded armed, and accompanied by a guard, at the usual hour of interview, to Moctezuma's palace. He then accused the emperor of the attack on Vera Cruz, and the conspiracy which was formed against the Spaniards in the city of Mexico ; and then urged the necessity of Moctezuma accompanying him from his palace to the residence of Cortez. Moctezuma, finding his designs were discovered, acceded to the degrading proposal. Cortez fearing that the causeways, which connected the city with the shores of the lake, might be broken down, ordered two brigantines,

sufficiently large to carry 200 men, to be constructed on the opposite banks. These vessels were completed, in a rude but sufficient manner, in a very short time, and brought, and kept under a strong guard, close to his quarters. Moctezuma was still detained a prisoner, but treated with great outward ceremony. Qualpopoca, who had been secretly instigated by Moctezuma to attack Esculante, having with others arrived at Mexico, were brought before Moctezuma, who accused him of attacking and killing the Spaniards at Villa Rica, without any authority from Mexico. Cortez having discovered the duplicity practised by Moctezuma, or his vassal, ordered the latter and some of his followers to be taken away, and on being examined separately, they confessed they had killed the Spaniards by the express command of Moctezuma. Cortez then committed an act of horrible atrocity, which neither the real or pretended duplicity of Moctezuma, and far less the conduct of the vassals who obeyed his commands, could justify. Qualpopoca, his son, and followers, were conducted, by orders, given by Cortez, to the great square of the city; and there, to the utter astonishment of the armed Mexicans, and in the presence of Moctezuma, publicly burnt to death.

Cortez having upbraided Moctezuma in stern language, said, that although, as a murderer, he deserved to be immediately executed, he would extend his mercy by doing no more than putting him in irons, and placing him in front of the great square, in order that he might behold the execution of his subjects. These irons were taken off the same day by Cortez, and an apparent good understanding established between him and Moctezuma. The latter was so far terrified by the execution he witnessed, and the dread caused by the intrepid mental character of Cortez, that he appears to have lost all powers either of deception, or of moral energy. He afterwards concealed nothing from Cortez; described to him the gold mines, and where they were situated; gave him finely-drawn maps of his dominions, and of the sea-coasts by which they were bounded. Meantime, a nephew of Moctezuma, reflecting on the degraded position of the latter, plotted an attack against Cortez, in order to release his uncle, and drive the Spaniards from Mexico. This attempt was immediately extinguished, by its timely discovery, and from its receiving no countenance from the timid Moctezuma. The latter, however, began to find his confinement so tedious, and so far to feel its degradation, that he suddenly resolved to conceal his real views. He then called together a general assembly of his principal chiefs; and, in the midst of them, acknowledged his allegiance to the King of Spain. This part he performed, with admirable dramatic effect, to the apparent astonishment of the Mexicans, who, however, feigned their assent. A treasure of gold, and emeralds, of great value, were then collected by Moctezuma and his chiefs, and presented with solemn pomp to Cortez: a part to be transmitted to the King of Spain, and the rest for the use of Cortez and his officers. This treasure was fairly

distributed ; and Cortez set apart the full value of all that Velasquez and his friends had contributed towards the expense of the expedition. This generosity on the part of Moctezuma was, however, advisedly made, when the chiefs had resolved to release him ; and some time after, he gave notice to Cortez that the latter, and his troops, must depart from the city. Cortez acquiesced, and pleaded only for time to have vessels built at Vera Cruz to carry his people from the country. This request was granted ; and further, that men should be at once sent by the emperor to fell timber near Vera Cruz for the purpose. Delay, having been gained—which was the first object of Cortez, who waited for the commission he expected from Spain,—and his people having now such unlimited confidence in him, that they unanimously obeyed all his commands, he expected that, for some time, he would have continued unmolested, in the pursuit of his designs for conquering the rich territories of Mexico.

This expectation was soon interrupted, by the arrival of messengers from the coast, with intelligence, and a representation in painting, of a fleet of eight ships, which appeared off the coast, near Villa Rica. Cortez, uncertain whether this was a squadron bearing his commission and reinforcements from Spain, or an expedition sent against him, disguised his views, by telling Moctezuma, it was now unnecessary to go on with building the ships at Vera Cruz, and that he would merely delay leaving Mexico, until he heard again of the fleet, in which he would embark with his people for Spain. A messenger arrived soon after from the commander of Vera Cruz, informing Cortez, by letter, that the ships were not from Spain, but from Cuba ; and fitted out by Velasquez, with 800 foot soldiers, eighty horses, and twelve pieces of artillery, on board, under the command of Pamphilo de Narvaez, who was named Lieutenant of New Spain, for the discomfiture and arrest of Cortez, and to take possession, for Velasquez, as the king's lieutenant, of all the country.

Cortez resolved at once to march against Narvaez ; and, taking every necessary precaution, for that purpose, he took farewell of Moctezuma, as if he were strictly fulfilling the promise he had made to leave his territories. This profession ill accorded with a force being left at Mexico, for the purpose of retaining Moctezuma a prisoner, under pretence of this precaution being necessary, as a guarantee of safety to the Spaniards, on their march to Vera Cruz.

Cortez on passing through Cholula was magnificently entertained and provided for, and he was soon joined by a numerous body of Tlascalans. Narvaez had landed his forces, and encamped near Zempoalla : having ineffectually attempted to enter Villa Rica. Cortez sent John Velasquez, in whom, as well as Ordaz, he now placed great confidence, to bring Narvaez to a reconciliation. The latter spoke of Cortez as a traitor ; and Velasquez, after being shown the great force brought by Narvaez, returned without any other result to Cortez. Meantime the latter found means to distribute, through his chaplain, Olmeda,

large sums of money, and other allurements, among the newly arrived troops. His force was greatly inferior in numbers; but his officers and soldiers resolved to conquer or perish for their leader. He attacked Narvaez at night with such extraordinary skill, as well as impetuosity, that the latter was surprised, wounded, taken prisoner, and sent next day in irons to Villa Rica. The army of Narvaez, 300 excepted, swore that day fidelity to Cortez, as the king's captain-general in New Spain.

The 300, who did not swear fidelity, were encompassed within an entrenchment, and for some time they were inclined to be refractory, but they at last surrendered and joined Cortez, who only lost two soldiers in this daring action.

After various preparations, and securing the future alliance of the Tlascalans, and other native tribes, he marched again towards Mexico, for its final conquest: justifying himself for his return, on the ground of relieving Alverado. He entered Mexico on the feast of St. John. Moctezuma was still confined to his quarters by Alverado, and consequently still a prisoner. The Mexicans resorted to arms, defended themselves from the house-tops: hurling down stones on the Spaniards, one of whom they took alive. Meantime Cortez brought up all his forces, and a battle, or fight, was carried on for several days: reckless of life by the Mexicans, who destroyed their bridges, and continued to hurl down stones and other missiles from the houses. Moctezuma having presented himself to appease them, he was answered by the most degrading, and certainly not undeserved reproofs; and although he escaped several arrows shot at him, he was wounded mortally, by a stone, in the head; and, refusing sustenance of any kind, died in sorrow four days afterwards.

Guatimozin, who was afterwards elected emperor, conducted, with undaunted bravery, the attacks and defence against the Spaniards. On killing one of whom, of considerable rank, he communicated to Cortez, "That being now convinced the Spaniards were vulnerable, though the death of each should cost the lives of 20,000 Mexicans, he should still have a multitude of subjects left to celebrate the final victory." He also projected the destruction of the Spaniards by famine. Cortez had, as prisoners, in his camp, three sons of Moctezuma, and many of the chief Mexicans, and the chief of their priests. The want of supplies however reduced him to determine on leaving the city; and, to baffle the plans of Guatimozin, to retreat at night. He accomplished this retreat with extraordinary skill, but with considerable loss. The design he formed was, not to invest the city until he had collected a sufficient force; with which, and by a regular system of tactics, he could utterly discomfit the Mexicans. He had collected such a great quantity of gold, and other treasure, as to be unable to carry the whole away, leaving behind, according to De Solis, the value of 700,000 pieces-of-eight. When retreating he was attacked, on the land and on the water, by a greater number of Mexicans than he had ever encountered

before. They fought desperately, but the Spanish artillery shattered their canoes, and the cavalry, artillery, and foot, caused the greatest destruction among the Mexicans, who approached in deep masses. This was, however, the most disastrous battle in which Cortez had been engaged. Two hundred Spaniards, most of whom were those who lagged behind carrying off gold, were either killed or taken prisoners, and forty horses were killed. Cortez not being able to carry off his artillery, rolled it into the lake : 1000 Tlascalans also perished, together with two sons of Moctezuma. Juan de Velasquez, his most distinguished officer, was also cut down, together with Salcedo, Morla, and other brave leaders. Donna Marina, and the interpreter Aguilar, were however safe to serve him. On the following day Cortez was attacked by a considerable force ; which he, in the first onset, repulsed ; and then, fighting on his way, gained possession of a temple on an eminence, which, with its area inclosed by walls, he transformed into a fortress, not difficult with his skill to defend. He reposed there until midnight, and then continued his march, meeting with occasional attacks, which he easily repulsed. Scarcity, of provisions and water, was the greatest cause of suffering among his troops, until, on arriving at a friendly canton, they were amply supplied. The Mexican army not only followed, but by an indirect route, advanced before the Spanish forces, and defended a valley or rather a pass, through which the road lay. Cortez now found his enemies in his front as well as in his rear. The whole population of Mexico appeared to have risen, and sallied forth, commanded by the captain-general of the empire : who, alone, was ever permitted to unfurl the sacred standard.

Cortez was now in a position, which rendered it inevitable, for him, either to fight, and defeat this formidable force, or to surrender. He harangued, and animated his troops. He then, on horseback, instantly led the attack, and with his cavalry, musketeers, and cross-bowmen, caused all before him to fly or fall. Cortez himself closed with the captain-general of the Mexicans, wounded him mortally with the first stroke of his lance, and a private cavalry soldier, Juan de Salamanca, leaped from his horse, seized the imperial standard, and handed it to Cortez. On observing their standard lost, the Mexicans fled with great fear and speed. The destruction of Mexican life on this battle-field is stated by the Spanish writers at 20,000 men ; and the whole routed army, they say, amounted, in numbers, to 200,000. Cortez was slightly wounded in the hand ; three Spaniards, only, died of their wounds ; none were killed in the battle. The spoil taken in the field is stated to have been of considerable value ; and Cortez ordered it all to be distributed among the soldiers. On the following day he marched to Tlascala, and was received with much respect and rejoicings. He suffered from neglecting the wound in his hand, but the Tlascalans healed it by simple vegetable applications.

He was then anxious to know the condition of his small garrison at Vera

Cruz ; and his messengers returned with letters from his lieutenant, who informed him that they were all well ; that vessels had approached the coast ; that Narvaez and Salvatierra were in safe custody ; that the soldiers were content ; and that the Zempoallans and neighbouring nations continued friendly.

Cortez then joined the Tlascalans against the Tepeacans, who were supported by the Mexicans. He defeated them and took their town, which, lying between Vera Cruz and Mexico, he fortified and named it *Segura de la Frontera*. The numerous prisoners were sent to Tlascala, to be sold as slaves ; a practice said to have been first practised by the Spaniards at Cuba.

He marched, with the Tlascalans, and part of his own forces, against Guacachula, which was occupied by a strong Mexican force. He captured this town, which was obstinately defended. A small reinforcement arrived soon after, sent by Diego Velasquez from Cuba, not to assist Cortez but to aid Narvaez, whom the Governor of Cuba had believed to have been successful in his expedition. The Lieutenant of Vera Cruz answered the commander of the reinforcement, by saying he would lead him and his small force to Narvaez, who was well. Instead of which he proceeded with them to Cortez, whom they willingly joined. The ship they came in brought good supplies of ammunition ; and the letters to Narvaez directed that Cortez, if he were not dead, should be immediately sent to Velasquez, under the semblance of justice, for disobeying orders, but, in reality, to satisfy a particular revenge of the Bishop of Burgos. A second small reinforcement arrived in another vessel, with like instructions. This force also joined Cortez.

He now resolved not to delay the conquest of Mexico. He had not only consolidated the friendship of his allies, but he had trained the Tlascalans, in some degree, to the European mode of warfare. The arms, artillery, and ammunition, brought by the two last vessels from Cuba ; the ship carpenters at Vera Cruz ; the materials for constructing vessels which he possessed ; the multitudes which he could call forth to carry all these stores to the banks of the Mexican lakes ; and his having an able naval architect, Martin Lopez, were all favourable to his plans. Lopez undertook building several small brigantines at Tlascala, to be carried over land to Mexico. Powder was the only article of which he had a scanty supply ; but as sulphur was discovered in sufficient abundance, charcoal easily made, and he either had, or found the elements for making, saltpetre, he was enabled to manufacture any quantity of powder.

Three vessels arrived soon after from St. Domingo, sent by Francisco Garay, to claim possession of the coast ; but being resisted, this force also joined Cortez. These vessels brought 150 well armed soldiers, seventeen horses, and a great abundance of stores. This succour was of the utmost assistance : for a number of the soldiers who came with Narvaez, now demanded of Cortez to fulfil his promise, to allow them to return to Cuba after

the expedition to Tepeaca. Instead of complying at once, he considering it essential that all the soldiers who were to accompany him to the final conquest of Mexico, should do so unanimously, as volunteers; and he issued a proclamation declaring that whoever wished to return to Cuba were free to go, and should be furnished with vessels, and provisions, for the voyage. Most of the soldiers of Narvaez accepted this offer; the rest joined the army of Cortez.

He at the same time sent two vessels, with trusty agents on board, to Spain, with a full account of the country, and all that he had done and experienced, concealing nothing; and, with all the treasures that he could to Charles V. His instructions, to the agents whom he sent on this mission were, that before they disclosed any thing, to find his father, and the agents whom he sent the previous year to Spain, and to act in concert with his father, and, also, if he thought proper, with the former agents. The latter had arrived safe in Spain, and were, with the father of Cortez, well received by the king, who, on leaving the kingdom, recommended them, during his absence, to his regent Cardinal Adriano; but the latter finding the Bishop of Burgos, president of the council of the Indies, opposed to them and to Cortez, wished the matter delayed until the king returned. The second agents arrived safely at Cadiz, and narrowly escaping being imprisoned, by order of the Bishop of Burgos. Preserving their letters, and leaving their presents behind at Cadiz, they joined the father of Cortez, and the first agents, at Medellin. The emperor having returned soon after, Cardinal Adriano heard, attentively, all the representations made by the father and the agents, as well as those made by the enemies, of Cortez. He was highly displeased at the orders issued by the Bishop of Burgos, and the detention of the presents intended for the emperor. The cardinal having become pope, the emperor, advised by him, received the agents, and appointed a council to examine the affairs of Cortez. Matters were finally decided in his favour; Velasquez was censured; perpetual silence was imposed upon him, in regard to the continent of America; and Cortez was confirmed in his command. Several regular friars were then ordered to New Spain, to convert the Mexicans; a fleet with arms and horses for Cortez, was directed to be equipped; and the royal letters, to him were signed at Valladolid, on the 22d October, 1522.

During this period, when, unknown to Cortez, his affairs were proceeding so favourably to him in Spain, he was actively engaged in reducing all Mexico. Towards the end of the year 1520, a ship fitted out by private adventurers, with a cargo of arms, ammunition, and stores, arrived at Vera Cruz, and the captain and his men joining Cortez, delivered the ships, and cargoes, to his lieutenant. He was at this time ready to march against Mexico, and on the following day he drew up the forces, with which he intended to advance, and found they consisted of 540 Spanish foot soldiers, forty mounted horses, and nine pieces of field artillery; exclusive of 10,000 Tlascalans, and a numerous body of

confederate warriors. On the first day they reached Tezmeluca, near the Mexican frontier. The cacique of this place had provided all necessary provisions for the march to Tezcuca: the place, which, not far from the city of Mexico, Cortez had designed for his head-quarters during the intended siege. He found, next day, the road for several leagues, closed up by trees felled across it by the Mexicans. The Tlascalans, however, soon cleared the way for the artillery, cavalry, and baggage. The Mexican army covered the whole plain before him; but they retreated, or dispersed, as Cortez advanced; and, on the following day, he entered Tezcuca, invited by its inhabitants, who became his allies. Leaving Sandoval in possession, Cortez proceeded, with 300 Spaniards, to take Iztapalapa, situated opposite, and near one of the causeways leading, to Mexico. He then advanced against the Mexicans, and in three days, it is said, that 6000 of them were killed by the Spaniards and Tlascalans. Several other caciques now allied themselves to Cortez. Battles, fights, or skirmishes, followed in various adjoining places, in all which the Mexicans were defeated with great loss of life. In one place, Tacuba, Cortez was, however, compelled to retreat.

Finding that Lopez had completed the construction of the brigantines, 10,000 Tlascalans were ordered, by their cacique, to carry them to Tezcuca. This extraordinary project of Cortez was completely accomplished; and, if fully appreciated, it was one of the ablest and boldest of his plans. A fresh supply of arms, accompanied by Father Urrea, and several persons of distinction, and soldiers, arrived at the same time at Vera Cruz. Guatimozin, a nephew of Moteczuma, having become emperor, made greater efforts, than any of his predecessors, to augment the military power of Mexico. Several battles were fought, by his forces, with furious desperation, but they all ended by the Spaniards being victorious; and by the latter taking several towns, and gaining over the caciques. At the same time a conspiracy of a few Spanish soldiers to assassinate Cortez, and some of his principal followers, was discovered. This he very discreetly suppressed. The conduct of young Xicontecatl, one of the commanders of the Tlascalans, and son of the old cacique, so far provoked Cortez, that he ordered him to be taken alive or dead. He refused to surrender, and was killed in defending himself. Though the son of their chief, he was disliked by the Tlascalans, and his own father approved of his death. The brigantines were, in a short time, fitted, rigged, and launched on the lake, and the troops reviewed by Cortez. His whole European force consisted of 900 men; of which 494 were either musqueteers or cross-bowmen: the rest of the foot were armed with swords, bucklers, or lances. Eighty-six were on horseback, and there were eighteen pieces of artillery mounted. A piece of artillery, with twenty-five armed men, besides rowers, were put on board of each of the brigantines. At the same time that the brigantines were to attack by the lake, Cortez laid his plans to invest the principal causeways. In this order the siege of

Mexico commenced. The aqueducts, conveying water to the city were cut off by the Spaniards. On the lake they were opposed by about 4000 canoes filled with armed men, decked with feathers and other ornaments. The whole lake appeared nearly covered with an armament of canoes. Cortez advanced towards them, with his thirteen brigantines in the form of a crescent; and, with the advantage of a light breeze, bore down upon the canoes; and with his cannon, fire-arms, and cross-bows, and by running down and oversetting the canoes, killed and drowned so great a number of the Mexicans, that the battle on the lake, might be compared to a massacre. The fleet of canoes was in a short time put in the utmost confusion; and finding it impossible to sustain the shock of the brigantines, those which were not upset or destroyed, fled with the greatest speed. The causeways were also invested by the artillery, and a temple close to one of those, which was defended by a numerous body of Mexicans, was assaulted and taken. Cortez then attacked and took several of the towns on the lake, which might have been considered faubourgs of the city. The Mexicans were described as defending them with intrepidity at first, but as abandoning them in a short time. The approaches to the city were found very difficult, in consequence of the dikes which had been cut through the causeways. Filling up these was a work of great labour, requiring much time. Whenever the Spaniards, and their auxiliaries, approached without the brigantines, they were greatly annoyed by the Mexicans in their canoes: of which they had still several thousands. Cortez, therefore, found it necessary to collect as many canoes as possible, and man them with his auxiliaries, from the towns around the lakes. He divided his brigantines into three squadrons, and the canoes he distributed into fleets attached to each squadron. The Mexicans finding their canoes, however numerous, unable to sustain the attacks of the brigantines, built piraguas of a much larger size, with very thick planks; and, one time, by decoying two brigantines to follow some canoes, laden, on purpose, with provisions, among the high reeds, where several piraguas filled with men lay in ambush, the Spaniards were very nearly disabled; the captain of one of the brigantines was killed, the other, and several men wounded. After a desperate resistance, the piraguas were partly sunk, and the others driven from their place of ambuscade. Several large piraguas, newly built, and filled with men, were found to be concealed, soon after, amidst the reeds, which grew to a great height, even where the water was sufficiently deep for the brigantines, in various parts of the lake. The Mexicans drove stakes down into the mud, until their sharp-pointed tops were a little beneath the water, for the purpose of rendering the manœuvres or sailing of the brigantines impracticable. The skill of the Spaniards enabled them to remove these stakes, and to dislodge and sink most of the newly-built piraguas.

The inhabitants and troops in the city were, it was told to Cortez by some of

the prisoners he had taken, suffering from scarcity of food and water. He was at the same time anxious to save the city from destruction, and made proposals for peace with Guatimozin. The latter was disposed to treat with Cortez, but being opposed by the priests, hostility was renewed. The Mexicans raised barricades of thick planks, with loop-holes; and widened and deepened the ditches. The Spanish artillery, in a short time, levelled those wooden barricades and drove the Mexicans back to the city; against which, Cortez advanced with his troops and the brigantines. He ordered one of his officers, whom he left with men for that purpose, to fill up the principal ditch in the grand causeway. This was unfortunately neglected. The first attack upon the city was met with more than usual bravery on the part of the Mexicans; and although the Spaniards killed great numbers of them,—set fire to many houses,—and destroyed a considerable portion of the approaches, yet, on retreating for the night, the sacred trumpet of the city was sounded by the priests. None else were ever allowed to blow it; and the Mexicans followed the Spaniards with unexampled boldness. Cortez had his horse killed under him. The neglect of filling up the ditch, according to his orders, occasioned greater loss of life, among his allies, than on any former day. Forty Spaniards were taken prisoners, one piece of artillery was lost; it was with difficulty Cortez gained the way to his brigantines; and he reached his head-quarters, wounded, and as he considered defeated. Above 1000 Tlascalans were killed. Sandoval and Alverado, who had been directed to assault the city in opposite directions, lost about twenty Spaniards; but not having, in their retreat, to repass an open ditch, the loss of life was proportionably much less.

The Spanish prisoners were sacrificed, the same night, to the Mexican idols. The city was illuminated, and the rejoicings were heard in the Spanish camp. Next morning, before daybreak, the Mexicans sallied forth, by the three causeways, to attack the Spaniards. The latter, though greatly fatigued, were prepared, and with the artillery, drove back the Mexicans. The disasters of the previous day, and the declaration of Guatimozin, that his gods had revealed to him that in eight days, precisely, he should destroy all the Spaniards, caused the greatest apprehension among the allies of Cortez: many of whom deserted during the first three nights. Guatimozin had sent to the neighbouring tribes heralds, each with the head of one of the sacrificed Spaniards, and gave out that Cortez himself was killed. Even the Tlascalans, and Tescucans, abandoned him until the eight days expired: when they were convinced that the Mexican oracle was false. He was soon after aided by the Otomies, a bold mountain race.

In a short time he was joined, according to the Spanish historians, by nearly 200,000 men. Meanwhile the Mexicans, though reduced to distress from want of bread and water, made frequent sallies, and reconstructed their defences. Cortez then invested the city, on several points at the same

time with his brigantines; and, having broke down the new works, he approached the parts of the city formerly destroyed by his forces, and effected on the first day a lodgement among the ruins. A final effort was made by Guatimozin to exterminate the Spaniards; but the artillery, commanding the three avenues of approach, drove the Mexicans back, leaving the ground covered with dead bodies. On the third day, the Spaniards became masters of the principal square, in which the Mexicans had concentrated in an immense mass; and, on being attacked by their enemies, from different points, were actually massacred.

The Mexicans, who escaped, fled with great precipitation; and those who were in another quarter, entrenched around Guatimozin, began to contrive measures to secure his retreat. A suspension of arms for three days followed. But the priests succeeded again in preventing a peace being concluded. Guatimozin ordered all his piraguas and canoes to assemble near the fortified quarter of the town, to which he had retired. Cortez ordered his brigantines, under the command of Sandoval, to the same part of the lake, while he approached on the land side. The Mexicans began the attack with impetuous bravery, but they could not resist the Spanish artillery. A truce was entered upon, but various excuses were sent to Cortez as to the final surrender of the city. Meantime Guatimozin was preparing to retreat.

On the 13th of August, 1521, the feast of St. Hypolito, and the fourth day of the truce, the Mexicans began at daybreak to embark in the canoes and piraguas. Sandoval observed, a little after sunrise, in a distant part of the lake, several piraguas paddling, with their utmost speed, for the mainland; and he immediately ordered off one of the swiftest brigantines, commanded by Holguin, to capture them. The brigantine overtook the piraguas, and firing into, and capturing, the foremost, Guatimozin, with his wife and attendants, were found on board.

Guatimozin, whom the Spanish historians describe as a prince of great bravery, and dignified bearing, surrendered with majestic grace: asking, only, respect and kind treatment for his consort and the women who accompanied her. He then declared that he was prepared to meet his fate, whatever it might be; that he was ready to follow Holguin, wherever the latter was pleased to carry him; and, that his subjects would cease to oppose the Spaniards, when they knew their emperor was a prisoner. He was about twenty-four years of age, handsome, well-proportioned, and fairer than the general complexion of the Mexicans. His empress, who was of nearly the same age, was the daughter of Moctezuma, of graceful carriage, but rather of a majestic than of a delicate appearance.

The Spanish general behaved, at first, to the captives with courteous respect; but as Guatimozin did not expect either his liberty or that his life should be spared, he desired that he should fall by the sword of Cortez, and not by viler weapons. The latter promised him his empire, under the suzerainty of Charles V., but this fair promise, and outward respect, did not endure long. The

eulogists of Cortez contended that he was unable to resist the clamours of the soldiery, and of the king's treasurer, Alderete, nephew of the Bishop of Burgos. That Alderete demanded that Guatimozin and his minister should be placed in his hands for examination, as to where the imperial treasures were to be found. Cortez, according to his historians, could not but comply with this demand; the soldiers, dissatisfied at not finding the gold for which they had fought, charged their general with having discovered and secreted the treasure for his own use. Alderete put Guatimozin, and his minister, on an iron rack, or grate, under which were placed burning coals. The minister shrieking, Guatimozin is said to have exclaimed, "Am I on a bed of flowers?" which silenced the minister, who died without further complaint, and without any other confession, than the truth, that all the Mexican treasure was thrown into the lake. Cortez, it is related, on hearing the shrieks of the minister, broke into the place of torture, and released Guatimozin, when he was half-roasted, but that afterwards he consented, in order to extort information as to where to find the treasure, for which the Spaniards continued their clamours, to allow the soles of the emperor's feet, after being soaked in oil, to be roasted. The tombs were then opened, and all the gold and precious stones, which were found buried with the dead, and all that was discovered on ransacking the temples, were distributed among the soldiers. Guatimozin was kept a close prisoner; and, afterwards, under pretence of a conspiracy which was not proved, he was, with the kings of Acolhuacan (Tezcuco) and Tlacopan (Tacuba), hung on the same tree, by the feet, to prolong their torments. This act of cruelty has been defended, even by modern historians, as a deed justifiable on the part of the great conqueror, *on the ground of religion and state necessity*. The deaths of Savonarola, John Huss, Jerome of Prague, Servetus, Mary Queen of Scots, Charles I., Louis XVI., and countless others, in Christian Europe; Nuncomar, and many thousands in Pagan Asia, perished, according to the doctrine of those who put them to death, either for the honour of the all-powerful Deity, or, for the safety of the state.

Bernard Diaz, one of the oldest soldiers in the army of Cortez, says, "that the death of the young Mexican emperor was a very unjust thing, and blamed by us all so long as we were in the suite of the captain;" and the Abbé Clavigero observes, "that this cruelty, afterwards, made Cortez melancholy, and gave him a few sleepless nights" (*una gran malenconia ed alcune vegghie*). He adds, the Mexican kings *were baptised, and confessed, and comforted*, in their sufferings, by friar Juan de Varillas, and they were *hung in good preparation for death, as Christians (li confessò e conforto nel supplicio: ch' eglino erano buoni Cristiani, e che morirono ben disposto: on d'è manifesto ch'erano stato battezzati)*.

On the fall of the capital of the empire, after two-thirds of its edifices and streets had been laid in ruins, all the neighbouring towns, and nearest provinces, surrendered. The kingdom of Mechoacan was then conquered, and its sovereign

driven to the mountains. Cortez, afterwards, marched to the South Sea, where he erected forts, and employed his carpenters in constructing ships. His Lieutenant, Gonzalo de Sandoval, reduced to submission the countries north of Tabasco; and Alverado, brought under subjection the region south-east of the city of Mexico, near the valley of Guazaco, or Oaxaco.

Christopher de Tapia, who had been commanded by Charles V., before the arrival of the agents of Cortez in Spain, to take possession of all the conquests made by the latter, appeared off Vera Cruz, but the governor of this place terrified the new rival; who immediately left the coast. Cortez then advanced in person against the province of Panuco, which he conquered, and, according to his general practice, divided among his officers and soldiers, and appropriated to them the inhabitants as slaves.

The atrocious cruelties of Cortez are not even defended by his most ardent eulogists.* He at one time burnt to death sixty caciques, and 400 nobles. Sandoval carried this atrocious sentence into execution after a grave consultation with Cortez, and the relatives, wives, and children of the victims, were compelled to be present to witness the excruciating deaths of their husbands, fathers, and brothers.† He then commenced rebuilding the city of Mexico; and compelled the inhabitants to labour incessantly in procuring materials, and constructing new edifices: among which his own palace, erected on the site of that of Motezuma, was built with great and extravagant magnificence.

He continued to send rich presents to the emperor, and the expedition bringing his commission from the king, as captain-general and governor of New Spain, arrived soon after the conquest of Mexico. The haughtiness and cruelty of Cortez, after, as well as before, the acquisition of this new dignity, are not denied. Some of his ablest officers in consequence plotted against him; and several attempts were made to assassinate him. In 1528, he considered it necessary to return to Spain, where his enemies were not complaining of his acts of real injustice, but assiduously misrepresenting his conduct as treacherous, to Charles V. He was received graciously at court; the order of St. Jago was conferred on him; and the whole fertile valley of Oaxaco, with the title of marquis; and with its towns and villages, were confirmed to him and his heirs. He married a rich lady, by favour of the king; returned as captain-general to Mexico; but the title of viceroy was bestowed on another person, under whom the royal audiencia was established. Cortez remained, however, twelve years in Mexico: where, besides the natural children he had by Donna Marina, several others were born to him. He returned to Spain in 1542,—accompanied the emperor on a disastrous expedition to Algiers;—found that his

* Among the eulogists of Cortez is Dr. Robertson; but he, even, in the text of his work, admits the above account, though he afterwards palliates the cruelty in a note, quoting Herrera, who says that thirty was the number of caciques burnt to death.

† Gomara Cron. c. 155. Cortez Relat. c. 291.

sovereign entertained a jealousy of him,—and living afterwards in retirement, and engaged, it is said, chiefly in directing the education of his legitimate and illegitimate children, he died at a village near Seville, on the 2nd of August, 1554, in the sixty-third year of his age. His body was afterwards, according to his will, removed to Mexico.

Having succeeded in conquering all Mexico, under every discouragement from Cuba, and from Spain, and, with his small forces, opposed by such formidable difficulties;—having not only received no assistance, and no countenance, from his sovereign, nor from Velasquez, but had been superseded, in his command, by both,—and having had the boldness to continue in authority, and in following up, and completing his conquest, in disobedience of royal orders and vice-royal commissions, Cortez must undoubtedly be considered one of the most intrepid, skilful, and successful, generals of any country or age. It was not until after he had completely subdued Mexico;—and, when uncertain whether his deeds or his authority should ever be acknowledged by Charles V., that he obtained the royal commission, confirming him in the authority, which his own ability alone enabled him to assume, and wield, from his first attempt at conquest, with the full confidence of nearly all those whom he commanded. We must, however, admit, that the spirit,—the conduct,—and the acts, whether religious or ambitious, which originated, and prevailed through the progress, to the end, and after the conquest, of Mexico, cannot be defended, either by the laws of God, or by the generally admitted moral principles of man.

CHAPTER VI.

CONQUEST OF PERU AND THE REMAINING COUNTRIES OF SPANISH AMERICA.

THREE men, of obscure origin, arose to carry out the designs conceived by a far greater man, the celebrated and unfortunate Nunez de Balbao.

Francis Pizzaro, the natural son of a gentleman of Estremadura, was born in the city of Truxillo, in Spain. His first employment in youth was that of a shepherd; and, not having even learnt to read, he left his home, to better his fortune in the western hemisphere. He distinguished himself soon after, as an officer, in the conquest of Cuba, and as one of the companions of Vasques Nunez. He afterwards became a lieutenant-general in Darien. His avarice, his disregard of moral scruples, and his ambition, stimulated in him a spirit of action that had no limit to its boldness, nor to its perseverance. When the city of Panama was built, he settled there, professedly, with the intention of living in retirement. This was, however, not believed to be expected from a man, who had previously acquired a bold and skilful military and political reputation. On the

execution of Nunez, under whom he had served, and with whose plans he was intimately acquainted, he resolved on exploring, and conquering, Peru. Almagro, who was born of an obscure family, in the town in Spain, from which he took his surname, was a man of genius and abilities, who acquired a fortune in the New World; and who also became an inhabitant of the new city of Panama.

Ferdinand de Luques, or Lugne, was a priest, and a man of great penetration, firmness, and judgment. He had amassed a large fortune in mining, and acquired the proprietorship of Tobago, in the bay of Panama, and in the city of the latter he was an inhabitant. These three personages, powerful in character, and in wealth, and all at an advanced age, joined their fortunes, in order to accomplish the great designs planned by Vasques Nunez.

As to the origin of the nation called *Peruvians* by the Spaniards, there have been written many speculative dissertations: all as obscure, and unsatisfactory, as those written to account for the origin of the aborigines of all parts of America: nor, are those recent works, which have been written to prove the Israelitish origin of the Peruvians, and based upon no more reasonable authority, than the fabulous histories and genealogies of the ancient world.

Manco Capac, or the rich, and his wife, Mama Ocolla, are supposed to have founded the empire of Peru, about the middle of the twelfth century; and, to have been the parents of the race of Incas. Manco is said to have taught the natives agriculture, and the useful arts; and that his wife taught the females to spin and weave; that he laid the foundation of the capital Cuzco,—built the temple of the sun, of which he taught them the worship;—framed patriarchal laws for governing the country;—and, that he suddenly disappeared, a great number of years after he founded the monarchy.

The Incas, his descendants, who succeeded him, were invested, or invested themselves, with unlimited power—but they bound themselves to govern according to the paternal laws of Manco Capac. They added numerous large provinces to the original territory. The thirteenth Inca, in descent from Manco, was Huana Capac, who left his territory to two sons, Huascar and Atahualpa; the former being declared Inca, the latter rose an army, and attacked him; and after a desperate and bloody battle, took Huascar prisoner, and declared himself Inca in his brother's stead. The death of Huana Capac occurred a short time after the first invasion of Peru by the Spaniards.

The progress of the Peruvians, in civilisation, and in some of the useful arts, appears to have advanced to a higher degree than that of any other aboriginal people in America. They had acquired, comparatively speaking, a more skilful knowledge of agriculture, architecture, sculpture, mining, and working the precious metals and stones. They irrigated their fields, and understood the fertilising power of the manure called guano, or huano, which has lately been imported into England from the islands off the coast of Peru, and supposed to be the ordure de-

posited by sea-fowls, during an unknown number of ages. They divided their lands into allotments: one portion being appropriated for supporting the worship of the sun,—the second for the maintenance of the Incas and the public administration;—and the third, and by far the greater portion, for the people generally, who cultivated the soil in common, no one having a longer tenure than for one year on the spot allotted to them for cultivation. The ground was not tilled by a plough, but delved by a hardwood spade. They made mirrors of polished stone, and made rude hatchets and tools of the hardest kinds of stone and flint.

They had iron, but did not know how to work or use it. Nor, from the want of tools, were they able to turn wood to useful purposes. They seem not to have had any important knowledge of mechanics; and the pulley being unknown to them, their largest buildings did not generally exceed twelve feet in height: though the blocks of stone, of which they were constructed, were of extraordinary dimensions. Trade and commerce was scarcely known among them. They had no coins or money. Their religion and laws were unfavourable to great deeds, to commerce, and to the spirit of enterprize.

The Peruvians were clothed; and they had a special code of civil and religious laws. The great Temple of the Sun at Pachacamac, and the palace, and the fortress of the Inca, were connected together so as to form one great building, of architectural skill, about a mile and a half in circuit. The ruins of their numerous temples and palaces are still to be traced. There were obelisks of great height and thickness; and mausoleums, and conical structures, erected in various parts of the empire. The great city of Cusco was the only large town. The spirit of their religion was mild. Their deities were visible objects,—not invisible beings. The sun, as the dispenser of light, warmth, vitality, and fertility, was their supreme deity, to whom their offerings were, not human victims, but other animals, and the fruits of the earth. The moon and stars were secondary objects of adoration. Peace, with the rest of the world, was one of the great principles of their civil and religious code. When they made war, it was not in a ferocious spirit; and they treated their prisoners with tenderness, and admitted them into their nation as brethren. Feudality was, however, established, although it may be said, that property was held in common; for none had more than a temporary usufruct in the soil, or, in what it produced. Such was the nation whose existence was menaced,—whose destruction was solemnly decreed, by Christians.

Francis Pizzaro, Almagro, and the priest Luques, having concluded their agreement, the latter solemnized high mass; and then, breaking the sacramental wafer into three pieces, each took one, swearing that, with the same zeal and perseverance with which they followed their salvation, they should prosecute the conquest of the empire of the Incas. It was agreed that Pizzaro was to lead the first expedition; that Almagro should take charge of bringing recruits, arms, and other supplies; and that Luques should remain at Panama to provide the necessary men, arms, ammunition, and provisions.

In November, 1524, Pizzaro departed from Panama, in a large strong ship, which had been constructed and equipped by the unfortunate Nunez de Balbao, with about eighty soldiers and sailors ; and, including officers, and gentlemen who accompanied the expedition, the whole number amounted to 114. He had on board some horses, and a good supply of arms, ammunition, and other articles. They touched at some islands, and landed at a place named Pinas, south of the Bay of Panama, where he found the country deserted, and covered with woods, thickets, bogs, and mountains. The few inhabitants had fled on the approach of the Spaniards. As he approached the equator it rained incessantly ; and he lost some of his men by sickness. He was followed by Almagro, with two ships and sixty men. They had, soon after, some skirmishes with the natives ; in one of which Almagro lost an eye. They afterwards found some gold ; and one of the vessels which had proceeded south to Cape Pasado, captured some natives, who described as exhaustless the riches of the empire of the Incas. Almagro returned to Panama. Pizzaro having remained on shore, suffered great hardships ; and on the return of the former with supplies, was found with his men reduced to almost helpless wretchedness, by the rains, unhealthy climate, and scarcity of food. They embarked for and landed on an island off the coast, and Almagro returned for fresh supplies to Panama ; but on arriving, the governor, instead of allowing him permission to raise fresh recruits, sent a ship to bring back the Spaniards who were with Pizzaro. This vessel brought to Panama all but thirteen men, who volunteered to remain with Pizzaro, who was joined soon after by Almagro with a few men. They then sailed along the coast until they reached, it is stated, the thirtieth degree of south latitude. They were two years in making this voyage. They captured during that time several piraguas, some of which are said to have been laden with cargoes of considerable value ; and Pizzaro having gained certain intelligence, by means of sending a trustworthy person into the country, of the great riches of the Incas, he and Almagro, with their remaining small force, returned to Panama.

Difficulties arising on the refusal of the governor to allow them to depart on a third expedition, Pizzaro departed for Spain, and on his arrival at Toledo, where the court resided, he was received graciously by Charles V., to whom Pizzaro brought as a present some Peruvians in their national dress, three apalcas, or Peruvian sheep, and gold and silver articles of considerable value. He related all his adventures and described the countries he had discovered for his sovereign, who conferred on him the authority of governor and captain-general, and the title of Adelantado ; and he recommended that Luques should be appointed by the pope, bishop of those countries. Almagro was appointed governor of Tumbez. Pizzaro with these powers left Toledo in July, 1528, accompanied by six friars to convert the Mexicans. He remained for a considerable time afterwards in Spain raising forces and supplies, and sailed in January, 1530, from

Seville, with the friars, his four brothers, and his troops and stores. They arrived safely at Nombre de Dios, from whence they crossed the country to Panama.

Almagro, on being informed of what his colleagues had accomplished, became exasperated at Pizzaro having acquired the chief honours for himself, and refused to co-operate with him, until Pizzaro should relinquish the title of Adelantado, and should agree to share equally with Almagro the territories to be conquered, and the spoils, after deducting the rights of the king, and the shares of the officers and soldiers. Pizzaro then embarked at Panama in three ships, with 185 foot soldiers; 37 horses, and with artillery, fire-arms, ammunition, and stores.

Meeting with contrary winds, he landed 100 miles north of Tumbez, attacked and slaughtered the natives and plundered their villages. His troops, soon after, began to experience great suffering from sickness, scarcity of food, and other privations. He sent his ships back to Panama with the gold and silver he had plundered, and to bring back reinforcements. Fresh troops, sent by Almagro, having arrived from Panama, and reinforcements also from Nicaragua. Pizzaro, according to the Spanish writers, made rafts to float along the coast as far as Tumbez, which he finally reached: having been surprised more than once, and some of his people cut off, by the natives; to whom, from the first, his conduct was perfidious and cruel.

He then advanced with his artillery, cavalry, and foot, to the town of Tumbez, and after defeating the Peruvians, by the slaughter of several thousands, he drove the survivors from that place, and from the valley of the same name, leaving behind them all the rich treasures of the Temple of the Sun, and of the Inca's palace, and other rich buildings. This vast treasure consisted of enormous gold and silver plates and utensils; emeralds, pearls, and other articles of precious value. Pizzaro then erected a fortress near the sea coast which he named St. Miguel. He then divided the gold and silver among the officers and soldiers, and made various arrangements for retaining possession of that part of the country, and for conquering all the remaining provinces.

At this time the throne of Peru was contended for by Huascar and Atahualpa, the two sons of the late Inca.

The forces of Huascar, who, as the eldest son, succeeded his father, were defeated with great slaughter, a little before this time, by those of his half-brother, Atahualpa, or Atabaliba, who also destroyed most of the inhabitants of Tumbez, who had declared for Huascar. This civil war enabled Pizzaro to negotiate successfully, as well as treacherously, with each of the brothers, who had by their folly, or ambition, precipitated the ruin of their country.

Atahualpa was the son, by a second marriage of Huana Capac to the Princess of Quito, a country which he had conquered. He was left by his father heir to Quito, as his natural inheritance. Huascar claimed it as sole heir to Huana

Capac; Atahualpa determined to retain what his father had bequeathed. War followed. Atahualpa was defeated and taken prisoner. He escaped and joined his people, whom he found dispirited, and ready to yield to the Inca. Atahualpa roused them, by declaring that when in prison, his father, Huana Capac, appeared to him, instructed him how to proceed, and transformed him into a serpent, in which form he was enabled to slip through a small aperture in the wall. This deception was rapidly circulated, and believed as a miracle, over the province. His people rose, nearly *en masse*, and he defeated in two or three battles the armies of Huascar, who was captured and kept as a prisoner. Atahualpa then usurped supreme authority over Peru, as well as over Quito. At this juncture he sent a mission, proffering friendship to Pizzaro. The latter advanced over a burning desert to visit Atahualpa at Caxamalca. He was met at the rich valley of Motupè by a second mission, headed by a person of the family of the Incas. He brought, exclusive of other rich presents and provisions for the army, a splendid pair of buskins, curiously wrought in gold, and bracelets of emerald and gold: requesting Pizzaro to put them on when he came into the presence of the Inca, that the latter might recognise and honour him, by observing him decked in those ornaments. It appears that, from not understanding the language of each other, and having no good interpreter, the message of the Inca was not comprehended at the time by the Spaniards. Pizzaro then sent his brother, Ferdinand, and some others, as an embassy to Atahualpa. They were everywhere, on the route, abundantly supplied with conveniences and necessities, and were received by the Inca in a splendid palace, where he, with those of his court, wore magnificent dresses, adorned with gold, emeralds, and feathers; and Ferdinand Pizzaro was served with liqueurs, in gold vessels, by two beautiful princesses. The Peruvians, and the Spaniards, understood not a word of the discourse of the other. Through the medium of a wretched interpreter, called Philippoli, who comprehended but little of the Peruvian tongue, Ferdinand Pizzaro said "that he came to congratulate the Inca on the merciful goodness of his king, and of the pope, who sent the Spaniards, expressly, to deliver the Inca and his people from the tyranny of the devil, and, in futurity, from the eternal torments of hell." Not comprehending this insulting address, the Inca is said to have replied, that he believed the Spaniards to be the children of the sun, to whose protection he recommended his subjects, and that he would next day visit the Spanish general in person.

The Inca advanced to the quarters of Pizzaro in magnificent state, escorted by an army; and Pizzaro, having drawn out his small force, in such order, as to present, in the front and flank, the appearance of an imposing body. Vincent de Valverde, who was appointed Bishop of Peru, walked forward to the Inca, with a crucifix and breviary; and, by means of an interpreter, pronounced a long and confused discourse, the substance of which, as related by various historians, was

that the Spaniards were sent by the King of Spain and the pope to make Christians of the Peruvians ; that the crucifix was the symbol of worshipping Jesus, who had died to save mankind; and that the pope, who, as representing the Saviour on earth, held authority over all the nations of the world, had, in virtue of that right, granted the whole country of Peru to the King of Spain, to whom the Inca was now required to swear allegiance. The Inca is said to have answered, that he would willingly become the ally and friend of the Spanish monarch,—but not his vassal,—and that the pope must be a very munificent priest, to grant away, so profusely, that which did not belong to him. That if the Christians adored a deity, who had suffered death, the Peruvians worshipped the sun, which could never die,—and that he should wish to know where the Spaniards learnt their knowledge of religion. Vincent, delivering his breviary to the Inca, replied, in this book. The Inca placed the breviary close to his ear, and then throwing the book on the ground, replied, it tells me nothing of what you have said. The bishop, who observed the eager looks of the Spaniards, on beholding the great quantity of gold ornaments, and other rich articles, which adorned, or appeared among, the Peruvians, called out loudly, “Vengeance ! Christians, vengeance! witness how this infidel despises your religion. Kill these dogs, who throw under their feet the law of God.”

The Peruvians were immediately attacked : they offered no resistance, and several thousands were slaughtered, as passively, as if they had been sheep. This atrocious carnage could not be termed a battle. It was a massacre. Pizzaro seized the Inca by the hair ; dragged him from the golden litter, in which he was carried ; and putting him in fetters, placed him, as a prisoner, in close confinement. The spoils of the day were collected and brought to Pizzaro. This booty consisted of large gold and silver vessels ; ornaments and utensils of gold ; jewels and various other articles belonging to the court, and to the great officers of state and of the Peruvian army. A great number of Peruvian women, including several virgins of the sun, were also made captives. The Peruvian camp which was a few miles distant, was plundered the next day, and the Inca, observing that gold and silver were the first objects which the Spaniards seized, offered as much gold as would fill three apartments as large as his prison, in consideration of receiving his liberty. Pizzaro, regardless of the means, provided he succeeded in obtaining gold, or in acquiring territory, sent three Spanish officers, with the Peruvian messengers, to Cusco, to receive and conduct back the ransom agreed upon by the Inca. They passed, on their way, through the town where Huascar was imprisoned. The latter was told that Atahualpa was a prisoner, and that they were going for the gold to ransom him. Huascar related the circumstances under, and by, which he was dethroned ; and promised three times as much treasure for his liberty as was agreed to be given on the part of his brother. The Spanish officers promised him redress, but left him in prison, until they had first secured

the treasures of Atahualpa. The conference of the Spaniards with Huascar, was immediately communicated to Atahualpa by his messengers. On receiving this intelligence, Atahualpa, to whose liberty, life, and power, the liberation of his brother would be fatal, gave instantly secret orders, which were immediately executed, directing that Huascar should be put to death. The treasure for the ransom of Atahualpa was brought to Caxamalca, besides a great quantity of gold, silver, and jewels, which were obtained by plunder.

Meantime, Almagro, jealous of Pizzaro, arrived from Panama with a reinforcement. In order to appease Almagro, Pizzaro gave him a large sum in gold, and the value of 100,000 pesos, to distribute among his men. The value of the gold and silver given to his own troops, (only 160 in number) by Pizzaro, is stated to have been equal to 1,000,000 crowns of the money of that period, and equal to more than 10,000,000 crowns of the money of the present time. By far the greatest sum ever known to have been divided among the same number of soldiers. When the soldiers received their money, about sixty of them demanded their discharge, in order to return home and live peaceably on their fortunes. Almagro opposed this, while Pizzaro contended, that for every man who returned to Spain with money, ten would leave home for Peru. He then sent his brother Ferdinand with the king's share of the treasure, and with the men who returned to Spain.

The accounts brought back of the exhaustless riches of the temples and of the capital, by the Spaniards who were sent for Atahualpa's ransom, induced Pizzaro and Almagro to become possessed of those treasures without further delay. Almagro urged, as the most effective measure, the immediate execution of the Inca. Pizzaro acquiesced in this barbarous demand. A sham trial was instituted, and Atahualpa was sentenced to be burnt, as a heretic and usurper. Father Vincent promising the Inca, that if he were to be baptised, he should not be burnt, but strangled. The Inca agreed, and he was hanged. This execution has been designated by Raynal, and others, a judicial assassination (*assassinat juridique*).

Pizzaro then marched with his forces to Cusco, the capital, from which the inhabitants, with their women and children, fled, with a few necessities only, to the mountains. The treasures found in this city were described as of enormous amount and value. It was also discovered, that the chief people of the country were, from time immemorial, buried with their most valuable ornaments, whether of gold or of precious stones. The tombs of the dead were, in consequence, soon despoiled by the Spaniards: who are said to have found greater treasures in the city of the dead, than in that of the living. Manco Capac, who was, after the death of Huascar, the heir to the throne of the Incas, had also fled to the mountains. Pizzaro, by flattering promises, induced him, and many of the Peruvians, to return to Cusco. He then perceived that the Peruvians adored Manco; that they were rising, in arms, in nearly all the provinces; and that they might, from

their great numbers, if resolutely determined, overwhelm the Spaniards, who were greatly reduced by the departure of those who returned to Panama. He therefore considered it safer to invest Manco with authority as Inca, than risk an attack by the Peruvians. Temporary peace was consequently established, until a strong reinforcement arrived soon after from Spain: which enabled Pizzaro to reduce Quito and several other provinces, and Peru may be said to have been conquered. It was not, however, the fortune of the Spanish invaders to remain undisturbed in their acquisitions.

Pizzaro and Almagro had scarcely conquered the empire of the Incas, before a bold attempt was made to dispossess them. A new adventurer, Benalcázar, governor of St. Michael, marched across the mountains, with a strong force, and conquered Quito. The famous General Alverado, the companion and lieutenant of Cortez, who had been placed by the King of Spain in the command and in possession of Guatemala, having heard of the great riches of the empire of the Incas, marched across the Andes; and after enduring great hardships, and losing about sixty men, reached Peru, with about 400 horse and foot soldiers, with the determination to dislodge both Pizzaro and Almagro. Alverado finding Pizzaro, and his colleague, more securely and strongly established than he had expected, this hostile expedition was terminated by two treaties: the one providing a share of the plunder for the soldiers of Alverado, the other, stipulating that the latter should return to Guatemala, leaving his troops with Pizzaro, on his paying 100,000 pesos of gold to Alverado; who received also, as a present, from Pizzaro 20,000 pesos, and valuable precious stones and ornaments.

Pizzaro founded Lima in 1534. He soon after received from Spain the title of Marquis, and Governor of Peru. Almagro received also the title of marshal, and authority to conquer the territories, extending 200 leagues south of the countries previously comprehended within the empire of the Incas.

Almagro, however, assumed the government of Cusco, which Pizzaro claimed. War between them followed. After several Spaniards were slain on both sides, they at last arranged temporarily their differences; and Almagro marched south to conquer Chili, which he entered with difficulty, over the snow and the mountain passes. He is said to have lost on this perilous expedition 10,000 Peruvians, and more than 150 Spaniards, amidst the snows of the Andes. He fought several battles with the Chilians; who, though a brave and fierce race, were, in all, defeated; but Almagro, in consequence of new troubles in Peru, abandoned Chili.

During this period Manco Capac obtained the consent of Ferdinand Pizzaro, who was an educated, and, compared to his half-brother Francis, a humane person, to attend what he designated a feast, but what was, in reality, a council of his chief countrymen. Among the natives, who had plotted under the tyranny of Almagro, was Philippillo, an interpreter, who had basely given false evidence

on the trial of Atahualpa. He afterwards joined a number of Peruvians, who had conspired to assassinate Almagro, and his treachery being discovered, he was executed by excruciating tortures. This execution occurred, when Manco Capac appeared amidst the council; at which, he prevailed upon the chiefs of the several provinces to rise, with all the Peruvians, simultaneously; and, by one last, and desperate effort, surprise and cut off the Spaniards.

The Peruvian chiefs, faithful to their promises, secretly communicated with the people, who rose on the appointed day, invested and took the castle of Cusco; besieged with one army the large city in which there were but seventy Spaniards; marched rapidly with another army towards Lima, against Pizzaro, and with a third they designed to surprise and destroy Almagro on his return from Chili. Manco Capac, however, was weak in judgment, and incapable of perseverance. He entertained superstitious delusions, and wanting courage, he directed the dispersion of the armies; and that they should all retire without delay, for security, among the fastnesses of the mountain regions. In the meantime, Almagro invested Cusco, and summoned the commander, Ferdinand Pizzaro, to surrender that city; which the former refused, but which was accomplished, by the soldiers from within, opening the gates and admitting Almagro with his forces at midnight. He made Ferdinand and Gonzalo Pizzaro prisoners. The war between him and Francis Pizzaro was renewed, and terminated finally by a bloody action, or battle, in which Almagro was defeated, and most of his officers, and a great number of men, killed. Almagro, who was old, weak, and gouty, was carried to the field in a litter, and after the battle, captured and imprisoned. A few months after, he was tried and judged by his enemies, and, by order of Pizzaro, strangled in prison.

His head was cut off next day on a scaffold. His body lay unremoved, and exposed nearly naked, no one having courage to bury the corpse of the colleague, who had so efficiently assisted a tyrant, now become sole governor of the Perus. In the dusk of the evening, a poor negro slave of Almagro, who may be ranked worthily with the *freed-man* of Pompey, appeared with a coarse sheet, rolled it over the body, and then, carrying it to the church, the friars interred it privately under the altar.

The kingdom of Quito, which had been conquered by Benalcazar, was reconquered by Gonzalo Pizzaro; and the latter was then ordered by his brother to march and conquer the countries east of the Andes. This bold enterprise was undertaken, with great spirit, and little success. After crossing the mountains, where a great part of his forces perished, from cold and want of sustenance, he reached the banks of the Naco, a branch of the Maragnon, or Amazon. He there constructed, with great patience and labour, a rude vessel, in order to convey them towards countries, which were reported by the natives, as rich in gold, and abounding with provisions. Fifty soldiers, under the command of Francis

Orellana, were sent forward in this craft, with orders to await Gonzalo and the remaining troops, where the Naco joined the main stream, and which, by report, was not far distant. Orellana was a young, ambitious, and daring spirit. He floated rapidly down the Naco to the Maragnon, and regardless of his trust, betrayed it, in the ardour of making new discoveries; considering, probably, and with truth, that no one could exceed the Pizzaros in treachery. He held out to his companions the glory and advantages of discovering the vast regions through which so great a river must flow, wherever it might fall into the ocean: whether to the east, to the south, to the west, or to the north. They readily consented to follow him, on one of the most daring and perilous expeditions that had ever been conceived.

In a frail leaky vessel, without a compass, and without any provisions, but such as they might be fortunate enough to procure by the way; and ignorant as to whether the mighty stream was broken by waterfalls, or interrupted by rocks or other obstacles; and without any information as to the nations, savage or civilised, who inhabited its banks, they floated down the greatest river in the world. They landed frequently, made various incursions on both sides; sometimes obtaining provisions by friendly intercourse, at other times by force of arms; they encountered and overcame numerous dangers; and, finally, reached the mouth of the Amazon, and, without knowing the place, arrived at a Spanish settlement, which had been formed on the Island of Culagua.

Orellana sailed soon after for Spain, where he gave the most exaggerated accounts of the country through which the Maragnon flows. He described a republic of giant female warriors; and, the very river obtained a name from the supposed country of those Amazons. His golden descriptions gave the name of Eldorado to the newly-discovered regions. And Europe continued for a long time to entertain the delusions which those exaggerated accounts created.

Gonzalo Pizarro, and his remaining followers, on discovering that Orellana had deserted them, began to retrace their way back, over the Andes; and after enduring extraordinary fatigue, suffering, and privations, and feeding on roots, berries, and reptiles, after they had eaten their horses and dogs, reached Quito: having passed on their return over twelve hundred miles of country; and after losing, in this ill-planned and wild expedition, it is said, 210 Spaniards and 4000 native Peruvians.

Pizarro afterwards conquered the province of Charcas, in which were situated the mines of Potosi. Several other places were also added by him to the Spanish dominions. As he advanced in age, his natural tyrannical character was, in his individual conduct and government, marked by increased haughtiness and cruelty. After the death of Almagro, the adherents of the latter plotted against Pizarro, in Spain; and the discontented, among all the Spaniards, conspired

secretly against him, in Peru. Pizzaro, considering his authority unstable, until he had exterminated all those who were formerly attached to Almagro, he reduced them to beggary, and then forbade, by an edict, any one to relieve them, even by alms.

On the publication of this decree, twelve of the former officers of Almagro, reduced to desperation, appeared suddenly on the grand square of Lima, where, it is said, there were at the time, it being Sunday, more than a thousand persons assembled; and crying out loudly, "Long live the King, but let the Tyrant die," they rushed into the palace of Pizzaro, the doors and gates of which being open, they ascended the stairs, entered the hall, where they found the governor, with his brother-in-law and two officers. Most of the household fled; and after some spirited resistance, in which four of the Almagrian officers fell, Francis Pizzaro was run through the body, and died immediately. His brother-in-law, and the two officers were killed at the same time.

Diego Almagro, natural son of Almagro, was immediately proclaimed governor of Peru in the great square; where there were assembled, secretly, many of his father's former adherents, and numbers who detested, but who, an hour before, were terrified on hearing the name of Pizzaro. This happened on the 20th of June, 1541. Lima, Cusco, and most of the principal towns, declared for young Almagro; but several places held out until the arrival of the new governor, Vaca de Castro, from Spain. This man was bred to the law: a profession not suitable to his mind. Charles V., who understood his character, appointed him governor of Peru. On assuming the government, he showed no respect for any one person, more than for all. He made no distinction between Spaniards and Peruvians; and considered both merely as Spanish subjects. He neither flattered nor threatened any one. He administered all public affairs, wholly as a governor; and lived simply and frugally, as a private gentleman. Almagro refused to submit, being still supported by about 500 men, with a train of artillery. A desperate battle was fought, September, 1542, from which, after a brave defence, the latter retreated. In this battle Almagro committed some acts of desperate resolution. On finding that Pedro de Candia, the commander of his artillery, had betrayed him, Almagro ran him through the body and killed him on the field. He retreated upon Cusco, but was betrayed, and given up by his soldiers.

Almagro, who was about twenty years old, was soon after tried and executed. His advisers and those who had chiefly supported him were subjected to a similar fate.

During the government of De Castro, who was sacrificed to the spirit of jealousy, and imprisoned on no charge that could be proved, and who gave his mind altogether to the civil administration, to the maintenance of peace, to the building of new towns and forming new settlements, the state of Peru was gene-

rally tranquil. From the time he was replaced by the Viceroy Nunez Vela, and the Royal Audience, corruption, intrigue, and jealousy, prevailed,—battles, in which much blood was shed, were fought, among the contending Spanish leaders of the Pizzaro party, and those who were their rivals. Gonzalo Pizzaro, after various actions, utterly defeated the royal troops in a battle in which he killed the viceroy. Pedro de la Gasco, a priest, was afterwards sent from Spain as President of Peru, and aided by reinforcements, fought several battles and finally defeated and captured Pizzaro, who was immediately tried and beheaded in April 1548.

Disorders, intrigues, and jealousies, continued to prevail among the authorities: one administration succeeded another; and the viceroys and judges quarrelled. Under the Viceroy Toledo, Tupac Amaru, the son of Manco Capac, was attacked, on retreating among the mountains, taken prisoner, and beheaded. He was the last of the line of the Incas.

Chili, from which Almagro had returned without establishing any settlement, was afterwards invaded by a force under Valdivia, who had several desperate encounters with the natives: who proved themselves a far more courageous and fierce race than those of Mexico and Peru. He was defeated, and cut off with great loss, and was succeeded in command by Villagra, who, with the other Spanish officers and troops, finally conquered all Chili, or the plain country lying between the Andes and the Pacific.

The country of Buenos Ayres had been discovered and partly explored, in 1515, by Juan Diaz di Solis, but was neglected from no gold having been found. The town, of the same name, was founded by Pedro de Mendoza, in 1535, and was afterwards twice abandoned, before it was rebuilt, as a permanent Spanish residence. The river and country of La Plata and Paraguay was discovered by Diaz de Solis, in 1516, and afterwards explored by Sebastian Cabot; and by the Jesuits, who went forth, not with arms to destroy, and conquer; but with eloquent tongues to persuade and win over, mildly, the possessors of those regions. Mexico and California, part of Florida,—nearly all South America, excepting acquisitions of the Jesuits, the Pampas, and the countries of difficult access, on the Eastern sides of the Andes,—and including the Spanish West India Islands, and excepting Brazil, were, finally, by injustice, treachery, and force, subjected to the crown of Spain. Slavery,—exclusive commerce,—trading monopolies,—the Royal Audiences,—and the non-toleration of any religion but the Roman Catholic, were immediately afterwards introduced, and continued, almost uninterrupted, until all those countries, except Cuba and Porto Rico, declared and established their independence.

CHAPTER VII.

CONDUCT OF THE SPANISH CONQUERORS TOWARDS THE ABORIGINES OF AMERICA.

ON reviewing the discovery and conquest of America by the Europeans, we are not the apologists, of the Portuguese, of the French, of the Dutch, or of the English. We will not overlook the conduct of either of these, towards the natives in the brief accounts, which we may give in this work, of the countries which have been subjected to each of those powers. In concluding this summary of the discovery, and conquest, of America, by Spain, we cannot dismiss this magnificent era, in the history of the world, without some remarks on the conduct of the Spanish conquerors towards the aborigines of America.* The Abbé Raynal philosophically, and humanely, observes,

* The great moral advocate of the aborigines of America was Father La Casas, Bishop of Chiapa. Purchas, in his quaint style, gives the following summary of the statements of La Casas.

"But for the poore Indians, Bartholomew de las Casas, a Dominike frier, of the same order as Fonseca, and after a Bishop of Chiapa, in America, hath written a large and vnanswerable treatise of the enormous cruelties, and *vnchristian antichristian* proceedings in the New World, the summe whereof is this, That the Indians were a simple harmelesse people, loyall to their lords, and such as gave no cause to the Spaniards of dislike, till they by extreame injuries were prouoked: they are also docile and pliant both to good doctrine and liuing. To these lambes, sayeth he, the Spaniards came as cruell and hungry tygres, beares, and lions, intending nothing those forty yeeres (hee wrote this anno 1542), but bloud and slaughter, to satisfie their auarice and ambition: insomuch that of three millions of people which were containyd in Hispaniola of the naturall inhabitants, there scarce remayned at that time three hundred, and now, as Alexandre Vrsino reporteth, none at all: only two and twenty thousand negroes and some Spaniards reside there.

"Cuba and the other islands had endured the like miserie; and in the firme land ten kingdoms, greater than all Spaine, were dispeopled and desolate; and in that space there had not perished lesse than twelue millions by their tyrannie; and he might truly say that fifty millions had payed nature's debt.

"In the island Hispaniola the Spaniards had their first Indian habitations, where their cruelties draue the Indians to their shifts, and to their weake defence, which caused those enraged lions to spare neyther man, woman, nor childe: they ripped vp the great-bellied women, and would lay wagers, who could with most dexteritie strike off an Indian's head, or smite him asunder in the middle: they would plucke the infants by the heeles from their mothers' breasts, and dash out their braines against the stones, or with a scoffe hurle them into the riuier. They set vp gibbets, and in honour of Christ and his twelve apostles (as they said,—and could the deuill say worse?), they would both hang and burne them. Others they tooke, and cutting their hands almost off, bid them carry those letters (their hands dropping bloud, and almost dropping off themselves) to their countrimen, which (for feare of the like) lay hidden in the mountaines.

"The nobles and commanders they broyled on gridirons. I once (sayth our author) saw foure or fve of the chiefs of them thus roasted, which making a lamentable noyse, the nicer captaine bade they should be strangled, but the cruell tormentor chose rather to stop their mouthes, so to prevent their outcries, and to continue their broyling till they were dead. They had dogs to hunt them out of their couerts, which deuoured the poore soules: and because sometimes the Indians, thus preuoked, would kill a Spaniard, if they found opportunitie, they made a law, that a hundred of them for one Spaniard should be slaine. The King of Magua offered to till the ground for them for fifty miles space, if they would spare him and his people

"I have not undertaken to be the eulogist of the conquerors of the newly-discovered hemisphere. My judgment has not been corrupted, by the splendour of their success, to overlook their injustice, and their crimes. I write history. I write it often with sorrow. Astonishment has, alternately, succeeded my painful reflections. I have been astonished, that none of those bold warriors did not observe the more certain conduct of gentleness and humanity; that they preferred to act as the tyrants, than as the benefactors, of the native races. By what strange blindness did they not feel, that by devastating the countries which they conquered, they diminished their importance; and that by cruelty they acquired possessions less tranquil, and less lucrative? It is asserted, that in countries where man has never appeared, the most timid animals will approach him, without fear. No one shall ever persuade me, that at the first sight of Europeans, the savage was more wild than the quadrupeds. That experience was certainly fatal, which taught him the peril of familiarity with Europeans."

We may reasonably conclude, that nearly all the accounts of the Spanish conquerors, and of the historians of their deeds, have greatly exaggerated the numbers of those whom they attacked and destroyed in battle; and we have no certain evidence to prove that in the accusations of Las Casas and others, the number of victims which were sacrificed to Spanish rapacity and fanaticism, were not overstated. But we have, after every deduction and allowance, sufficient proof of the extirmination of whole tribes, and the annihilation, either by sudden means, or by slower destruction, of a great portion of the native inhabitants.

from the mynes. The captaine, in recompence defloured his wife; and hee, hiding himselfe, was taken, and sent into Spaine, but the ship perished in the way.

"In the kingdom Xaraqua, in Hispaniola, the gouvernour called before him three hundred Indian lords, which he partly burned in a house, and put the rest to the sword, and hanged vp the Queene, as they did also to *Hiquanama*, the Queene of *Hiquey*. Of all which cruelties our author an eye-witness affirmeth, that the Indians gaue no cause by any crime, that had so deserved by any law.

"And for the rest that remayned after these warres, they shared them as slaues. They which should haue instructed them in the Catholike faith, were ignorant, cruell, and couetous. The men were spent in the mynes, the women consumed in tillage, and both by heauie burthens which they made them carry, by famine, by scourging, and other miseries.

"In New Spaine, from the yeere 1518 to 1530, in foure hundred and eighty miles about Mexico, they destroyed aboue foure millions of people in their conquests by fire and sword, not reckoning those which dyed in seruitude and oppression. In the prouince of Naco and Honduras, from the yeere 1524 to 1535, two millions of men perished, and scarcely two thousand remayne. In Guatimala, from the yeere 1524 to 1540, they destroyed aboue foure or five millions vnder that *Aluarado* who dying, by the fall off his horse, complained (when he was asked where his paine was most) of his soule-torment; and his city Guatimala was with a threefold deluge of earth, of water, of stones, oppressed and ouerwhelmed.

"They did the like in the kingdom of Venezuela, destroying foure or five millions; and out of that firme land, carried to the islands for slaves at times, in seuentene yeeres, a million of people.

"But why doe I longer trace them in their bloody steps; seeing our authour, that relates much more than I, yet protesteth that it was a thousand times worse. Or what should I tell their sparing no persons? plucking the child from the brest, to quarter it to the dogges; torturing kings with new deuices, borrowed eyther from the inquisition or from hell; cutting off the noses and hands of men and women that liued in peace with them; selling the father, mother, and child, to diuers places and persons; lying with the women (as one of them bragged), that, being with childe, they might yeeld more money in the sale? How was nature become degenerate in these prodigious monsters?"—*Purchas*, vol. v., *et seq.*

The aborigines of Hayti were estimated at not less than 1,000,000 of inhabitants, when discovered by Columbus. They were a sober hospitable people. Poverty was unknown among them. They led simple lives, their food was maize, fruits, esculant roots, shell-fish. The Spanish themselves describe them as a humane people, without malignity; while Columbus gave them red caps, beads, pins, knives, small bells, &c., in exchange for gold and provisions. They assisted him in building his fort at Hayti. He always urged that they should be kindly treated; but the love of gold was paramount to humanity, among his followers, and among the Spaniards who afterwards resorted to Hayti: many of whom were convicts, who not only conspired against Columbus, but against all authority. Gold and food was supplied by the natives. The more they gave the more the insatiable Spaniards demanded. Under the pretence of forcing them to embrace Christianity, Ferdinand, after the death of Isabella, consented to divide the whole island, and all the aborigines, as slaves among the Spaniards according to their rank. The natives were hunted by blood-hounds,—they were dragged to work, in the mines coupled, and chained together, without regard to sex. In despair, the natives often, first slaying their wives and children, poisoned, hung, or stabbed themselves. The Spaniards, in their superstition, also sacrificed thirteen aborigines daily, in honour of Jesus, and the twelve apostles. Fanaticism was always combined with the rapacity of the Spanish conquerors and soldiers. The whole Haytian race was soon completely exterminated. The atrocities, cruelties, and base treacheries of Obando, of Pedrarius, and of Cortez, in Mexico; of Pizzaro, in Peru; and of the Spaniards in every part of America which we have briefly alluded to, are well known to all readers of the early details, and of the various accounts of the European settlements in America.*

The Peruvians, from all the information that we can rely upon, seem, from the first appearance of their conquerors, to have entertained the most superstitious and dispiriting fears of the Spaniards; and to have submitted or fled, or allowed themselves to be massacred, with much less bravery, and resistance, than was displayed by the Mexicans. The avarice, the cruelty, the deception, and treachery of the human monsters, who subdued Peru, would seem to have exceeded in atrocities those of all other conquests. But history, unfortunately, has had to record so many unjust wars, conquests, and tyrannies, in which carnage, treachery, and cruelty are the conspicuous facts, that we are compelled to hesitate, in pronouncing a comparative judgment, even on the atrocious conquest of Peru.

The Spaniards, whether in St. Domingo, Mexico, Peru, or wherever they acquired power in America, forgot every feeling of benevolence, in their avaricious passion for gold. They acted towards the most civilised of the aborigines, not as if they were human beings, but as brutes. They declared that even the Mexicans, Tlascalans, and Peruvians, had no governments worth preserving;

* See Herrera, Las Casas, B. Diaz, Raynal, &c.

because they did not exactly resemble that of Spain ; that they had no magistracy, inasmuch as it did not accord, in its forms, with the police of Madrid ; that they could have no virtue, as they had not been baptized,—and that as they were not Christians, it was a duty, in order to punish them, to introduce the inquisition.

The Jesuits, and such men as Bartholomew de las Casas, Bishop of Chiapi, were alone the Europeans, who, in Mexico, and in the other provinces of Spanish America, had acted like Christians, and as members of the great human family towards the red nations of the new hemisphere.

CHAPTER VIII.

DISCOVERY AND CONQUESTS OF THE PORTUGUESE AND DUTCH IN AMERICA.

THE Portuguese, as early as 1482, extended their discoveries along various parts of the coast of Africa, from Tangier south to Benguela, in 10 deg. 35 min. south latitude. In 1487 they reached the Cape of Good Hope : and, they discovered, and sailed, on a previously unknown route to India, in 1497.

In 1500 Don Pedro Alvarez de Cabral, on sailing with a fleet of thirteen vessels from Portugal for India, proceeded to the Cape de Verd islands, and in order to avoid the calms, experienced by him, during previous voyages, off the coast of Africa, he sailed on a south-westerly course, and discovered, accidentally, the coast of Brazil. If the western hemisphere had not been discovered previously by Columbus, it would, soon after, have been found out by accident. But this circumstance, does not detract in the least, from the intrepidity and scientific ability of that great man.

Cabral finding a heavy sea rolling on the coast, sailed as far as latitude 15 deg. south. He entered a harbour, which he called Porto Seguro ; and finding the country fertile, healthy, and well watered, landed a number of his men. The natives were kind, charitable, and gentle. He erected a cross, and took possession of the country in the name of his king. He then despatched a vessel to Lisbon with an account of the discovery he had made ; and left two of the felons, he had on board for transportation, ashore in Porto Seguro, in order to learn the native language.

Expeditions were soon after sent from Portugal to this new region ; and disputes arising with the King of Spain as to its limit, it was finally agreed that Portugal should possess the country south from the river Maragnon, or Amazon, to the river Plate.

The native inhabitants of this magnificent region resemble very nearly, in complexion, the Portuguese. The aboriginals of America, are, in truth, gene-

rally, almost as fair, as the inhabitants of Portugal. The native Brazilians were far from being as far advanced in civilisation as those of Mexico, Peru, and Guatemala. The Brazilians were chiefly occupied as hunters and fishers ; they made bread of the flour of cassava, or manioc root : they fed also on other roots and herbs, and on wild animals, birds, and fishes. They had no domestic live stock, and raised no corn. They were found by the Jesuits tractable, and apt to learn, and they committed their children readily to them for instruction. The Jesuits were truly the protectors of the native Brazilians. The Portuguese government was, from the first informed of the great extent, and general fertility and salubrity of the vast empire to which they laid claim : the area of which was estimated as equal to 200 kingdoms as large as Portugal. But as it was believed that neither gold, silver, nor precious stones abounded, and as the cultivation of the soil was never contemplated by the early discoverers, and conquerors, of America, the settlement of Brazil was long neglected, except as a felon colony.

In 1549, John II., King of Portugal, sent over to Brazil, De Souza, as governor-general. He attacked and defeated the Aborigines ; founded San Salvador, and built convents for the missionaries. Settlements had also been established at Pernambuco, Santos, or St. Vicente, Porto Seguro, Ilhios, and Itamarca. Some other towns were also founded. Under the auspices of the Admiral Coligni, the French Protestants formed the design of settling in Brazil ; but the colony, which they founded, and called Fort Coligni, and to which three or four ships with settlers had proceeded, was finally ruined by the indiscreet zeal, and by the intolerance of the Calvinist ministers, and in 1578, the fort was destroyed, and the colonists killed, or dispersed, by the Portuguese.

From this period, with the exception of occasional descents upon the coast by the French and English, and some skirmishes with the natives, the Portuguese settlements proceeded slowly, but without interruption, until the Dutch, in 1626, determined to establish a West India Company. With that view, a squadron, with a considerable force, sailed from Holland, which, after some resistance, captured the capital, San Salvador, where they found considerable riches. The Dutch then took possession of the surrounding country. War between Holland and Spain, on the coasts of Europe, and those of Brazil, followed. A large Portuguese fleet recaptured San Salvador ; and in 1630, a Dutch fleet of 46 ships arrived at Pernambuco, landed 3000 troops, who assaulted and took the city of Olinda, and the whole province of Pernambuco. In the space of seven years the captainships of Itamarca, Paraiba, and Rio Grande, were added to the Dutch possessions. The war, between Spain and Holland, was generally successful to the Dutch : the latter is said to have captured 547 of the ships fitted out against them by Spain, and to have taken on the coast of America, more than the value of 45,000,000 florins, of the money of that period.

John Maurice, Count of Nassau, a near relation of the Stadtholder, Prince of Orange, was appointed *Governor of Brazil and South America*, in 1636, and sailed from the Texel with four ships and 300 soldiers. He arrived, after being joined, near Madeira, by Admiral Vander Dussen, off the coast of Brazil, in January, 1637. He was followed by three other ships with troops. After landing with his forces, amounting to nearly 4000 men, he defeated the Portuguese in a battle, which was obstinately fought, near the fortress of Porto Calvo. He took that, and afterwards several other places. He fitted out two squadrons: one to capture vessels along the coast of Brazil, the other to take the fort of La Mina, on the coast of Africa. Both enterprises were successful. Other engagements, between the Portuguese and Dutch, were less fortunate for the latter; but Count Maurice maintained his ground in Brazil. In 1640, a fleet of 90 ships of war, sent from Spain, in order to drive the Dutch from Brazil, arrived off the coast. They were attacked, with an inferior force, by the Dutch Admiral Loos, who gained advantages over the Spanish fleet, but was killed in the action. His successor in command, Admiral Huyghens, fought the Spanish fleet on each of the three following days; and on the last, drove them with great loss, on the rocky shallows off the coast: many of the Spaniards were drowned by shipwreck, and a great number died of hunger and thirst. Of the whole fleet, only five ships returned to Spain.

Portugal having this year revolted, and freed its government from that of Spain, John, Duke of Braganza, ascended the throne; but Maurice believing that peace would be concluded between Portugal and Holland, resolved that before the cessation of hostilities, he should possess the greatest possible extent of territory in Brazil and Africa. He recovered the captainship of Sergippa from the Portuguese; and sent an expedition also with 3000 men against Loanda and St. Thomas, in Africa. He succeeded in taking both. On the following year, he attacked and captured St. Louis and the Island of Maranham; and the whole of that rich captainship surrendered to his forces. A peace in Europe, and a truce for ten years in America and Africa were signed between the King of Portugal and the States General, in June 1641. In the course of two years, the mismanagement of the Netherlands West India Company, under whom the Dutch possessions in Brazil were governed, led to the recovery of those rich territories by Portugal. A great proportion of the inhabitants, especially the cultivators of the sugar plantations, were Portuguese: the company's unwise instructions, and exactions in money, and in sugar and Brazil wood, caused the greatest discontent. Count Maurice represented the impolicy of those demands, and the danger of enforcing them. This able commander, and administrator, was recalled; and with his son and the greater part of his forces, he left Brazil with thirteen ships of war, in May, 1644.

The government of Dutch Brazil was then entrusted to a commission, con-

sisting of a merchant of Amsterdam,—a goldsmith of Harlaem,—and a carpenter of Middleburg, who were prudent men in their several trades, which they understood thoroughly; but they comprehended little else; and by endeavouring to execute strictly the orders of the company, and by demanding all exactions from the Portuguese planters, a revolt was planned, under the countenance of the Portuguese Viceroy, by John Fernandez Veira, a man who had been formerly a butcher's apprentice in Portugal, afterwards a page to one of the magistrates of Olinda, and after its capture, he became rich as a factor for the management of the Dutch sugar plantations. This revolt was carried into effect, with extraordinary skill, and with complete success, notwithstanding the great exertions and bravery of the Dutch admiral, and of fresh reinforcements, by several fleets, from Holland, and a war between the latter and Portugal, which was carried on at vast expense and great loss to Holland until 1655, when the Dutch were compelled to abandon the last of the possessions which they had acquired in Brazil. The details of the affairs of the Dutch in Brazil are remarkably instructive to those who would plant, or retain colonies. Public companies have, in the end, been exceedingly injurious to the real interests of Holland. The exceptions are few, where they have not, as trading companies, been pernicious in all countries. By the cupidity of the Dutch West India company, Holland lost Brazil. Had the Dutch government settled the country, by private enterprise, and protected the colonists only as citizens, it is probable that a great part of Brazil would have been still held by the Netherlands.

The Dutch planted a colony on the banks of the river Hudson, in 1610, and, in 1634, they settled on the Island of Curacoa, on account of its good pasture and convenient position; and in 1639, they established a colony at St. Eustatius, which had been resorted to previously by some French, and soon after at St. Martin. In 1732-4 the Dutch settled also on the river Berbice.

When Count Maurice departed from Brazil, the possessions which he had acquired, included seven captainships, one capital, thirty towns, and forty-five regular fortresses. Exclusive of natives, and of the troops and sailors, there were in those territories above 20,000 Dutch citizens of all ages and of both sexes; 60,000 negro slaves. The average produce of sugar cultivated by the latter, besides other crops, amounted to 25,000 large chests.

Since that period, the Portuguese have remained the undisputed masters of the great Brazilian empire. The resources, the population, the productions, and trade of which, and the separation of its government from that of Portugal, will require a separated account, which we shall endeavour to detail in a separate form.

CHAPTER IX.

ORIGIN AND PROGRESS OF NEGRO SLAVERY IN AMERICA.

THE Portuguese having formed establishments on the coast of Guinea, and as far south as St. Paulo de Loanda and Benguela, before the discovery of America, the traffic in slaves, at all periods carried on in Africa, was scarcely, if at all, undertaken by Europeans, until the rapacity of the Spaniards, first, caused a demand for negro labour in the western hemisphere.

The conquerors of St. Domingo, having plundered the meanest hut, in order to obtain gold, and having afterwards worn out and exterminated the Aborigines, by subjecting them to work in the mines, they were the first to employ slave labour in the new world. Negroes were, previously, brought to the Portuguese stations on the African coasts; whence they were soon after transported, as were also the convicts of Portugal, in order to cultivate the soil of Brazil.

All the European nations, who established colonies in America, introduced slave labour at an early period; but, for a long time, England was the only country, which had engaged in the disgraceful and atrocious traffic of supplying the foreign plantations of other Christian states with slaves. The early navigators of England, who frequented the coasts of Africa and America, cannot be considered in a more favourable light, however much their exploits have been extolled, than piratical marauders. We cannot even except Sir Francis Drake from this black catalogue; and, excepting that their exploits were conducted upon a greater scale, and that their plundering adventures were sanctioned by royal authority,—although the latter was sometimes disregarded,—the celebrated Buccaneers, of the Antilles and Lucayan islands, had as high a moral justification, for their piracies and murders, as the authorised depredators, who sailed under the English flag.

Of those armed maritime rovers, the one who appears in the most dishonourable character in the naval chronicles of England, is Sir John Hawkins, afterwards the treasurer of Queen Elizabeth's navy. His father, who had traded to the Canaries and to the coast of Africa and Brazil, left his journals, containing glowing accounts of these countries, to his son, who was also brought up to the sea. Hakluyt, describing the first slave-trading voyage of "*the right worshipfull and valiant knight, and treasurer of her Majestie's navie,*" says, in his quaint style, "*and being amongst other particulars assured, that NEGROES were VERY GOOD MARCHANDIZE in Hispaniola, and that store of NEGROES might easily be had upon the coast of Guinea, resolved within himselfe to make trial thereof,*

and communicated that device with his worshipful friends in London : namely, Sir Lionel Duckett, Sir Thomas Lodge, and many others, all which persons liked so well of his intention, that they became liberal contributors and adventurers in this action, for which purpose there were three good ships immediately provided. The one, called the *Solomon*, of 120 tunnes, wherein Mr. Hawkins went himself as general ; the 2nd, the *Swallow*, and of 100 tunnes ; and the 3d, the *Jonas*, of 40 tunnes, in which three ships Mr. Hawkins took no more than 100 men."

With this fleet Hawkins sailed from England, in October 1562, and having touched at the Canaries, sailed for and arrived at Suruheme, "*when,*" according to Hakluyt, "*he stayed some good time, and got into his possession, partly by the sword, partly by other meanes, to the number of 300 NEGROES at the least, with other marchandises which that countrey yeeldeth. With this praye he sailed over the ocean sea unto the island of Hispaniola, and arrived first at the port of Isabella, and there he had reasonable utterance of English commodities, as also of some part of negroes, trusting the Spaniards no further than that, by his owne strength he was able still to master them. From the port of Isabella he went to Porte de Plata, where he made like sales, standing always upon his gard : from thence he sailed to Monte Christi, another port on the north side of Hispaniola, and the last place of his touching, where he had peaceable trafique, and made vent of the whole number of his negroes, for which he received in those three places, by way of exchange, such quantitie of marchandise, that he did not onely loade his owne three ships with hides, ginger, sugars, and some quantities of pearles, but he freighted also two other hulkes with hides and other like commodities, which he sent into Spaine, and thus leaving the island, he returned and disembarked, passing out by the islands of the Caycos, without further entering into the bay of Mexico in this his first voyage to the West India. And so with prosperous successe, and much gaine to himselfe and the aforesaid adventurers, he came home, and arrived in the month of September, 1563."*

Such is the account we have of the commencement of the trade in slaves by the English, as written about 1598, with complacent satisfaction, at its success, by the Reverend Richard Hakluyt, Prebend of Westminster.

It appears that many of the negroes who had been sold in Hayti by Hawkins, were inveigled away by him from Africa, by his describing their wretched condition, in comparison to what it would be in the fertile and happy country, to which, if they pleased, he would convey them, and where they would be received with hospitality and friendship. These negroes had previously been attacked by a hostile tribe, and the former being assisted by Hawkins, captured several of the latter : by which means, he carried to Hayti a mixed cargo of nearly 400 of both tribes.

When he returned to England with his ships richly laden, the success of his voyage occasioned the greatest curiosity and interest ; and some persons, who

judged of the expedition according to its barbarous character, represented its iniquity to Queen Elizabeth; who sent for Hawkins, and expressed her displeasure at his carrying off the Africans without their consent. Hawkins denied his having done so; and that he considered what he had accomplished was an act of humanity, in carrying men with their own consent, from a country of heathen barbarism, to a land of Christians, who would soon convert the poor infidels. This canting hypocritical declaration satisfied the virgin queen; who promised her countenance and support to Hawkins, while he continued to carry Africans, with their free will, to where they should embrace the true faith. We may observe that the most cruel traffic in which the English were engaged, was like other atrocities, commenced under a religious pretence.

Dr. Robertson, in his history of America, dwells upon, and exemplifies, the prevailing combination of fanaticism and avarice which distinguished the discoveries, conquests, and settlements of America. The endeavour to palliate injustice and cruelty by religious pretexts, or motives, is certainly among the most remarkable, and prevalent, iniquities of that period.

In October, 1564, Hawkins sailed on his second slave-trading voyage, on board the *Jesus*, of Lubeck, of 700 tons: a great burthen for a ship at that period. He was accompanied by his former ship, the *Solomon*, and two smaller vessels; and, having met at sea with two of the queen's armed ships, the *John Baptist*, and *Minion*, they proceeded together to the coast of Africa. On his arrival, Hawkins commenced trafficking on the coast of Sierra Leone, and in order, if he could, to keep his promise to the queen, he began his former method of inveigling the negroes away from their country; but as none of those, whom he carried away during the last voyage, had returned, he found the Africans suspicious; and the masters and crews of the ships of war becoming impatient,—some dying, and all suffering from the delay on an unhealthy coast, the masters proposed immediate recourse to the compulsory capturing of negroes. The Africans were consequently attacked several times; sometimes with success, and often with the loss of life on both sides: at length they completed their cargoes of human victims. In the journal of this piratical expedition in Hakluyt's collection, it is stated:—"The 29th of the same month (January), we departed with all our ships from the *SIERRA LEONA*, towards the West Indies, where, for the space of twenty-eight daies wee were becalmed, having nowe and then contrarie windes, and some tornados amongst the same calme, which happened to us very ill, being but reasonably watered for so great a companie of *negroes* and ourselves, which pinched us all; and that which was worst, put us in such feare, that many never thought of getting to the Indies, without great death of negroes and themselves: but Almighty God, who never suffereth his elect to perish, sent us the 16th of Februarie the ordinarie briesse, which was the north-east winde, which never left

us until we came to an island of the *cannybals*, called *Saneta Dominica*, on the 9th of March."

Hawkins proceeded with his vessels and slaves from one Spanish port to another in the West India islands, until he sold all his negroes, and retired to England by way of Florida.

Such was the origin of that atrocious traffic, which England carried on, by many of her merchants, shipowners, and mariners, becoming a confederation of legalised pirates; who conducted their depredations, by fleets fitted out from her harbours; who entered into the *assiento* contracts to supply the Spanish West Indies with negro slaves; and, who bequeathed to America the most pernicious and, up to the present day and probably hereafter, a greater curse than all the plagues which affected the Egyptians.

CHAPTER X.

FRENCH DISCOVERIES AND SETTLEMENTS IN AMERICA—FRANCIS I. COMMISSIONS VERRAZANI TO MAKE DISCOVERIES—JACQUES CARTIER DISCOVERS THE ST. LAWRENCE—COLIGNI; THE HUGUENOTS, UNDER HIS AUSPICES, ATTEMPT TO COLONIZE BRAZIL AND FLORIDA—DISASTROUS END OF THOSE COLONISTS.

FRANCIS I. of France, on being informed of the great discoveries and conquests made in America and the Indies, by the subjects of his ambitious rival, Charles V., and by the Portuguese, commissioned Verazani, an intrepid Florentine navigator, to proceed on a voyage of discovery in 1524. This navigator proceeded to the coast of America, along which he is said to have sailed from latitude 28 deg. N. to 50 deg. N.; being about the same extent of coast as that which was discovered and explored by the Cabots in 1496-7. On a third voyage, Verazani was shipwrecked, and perished. It would appear from various records, that from the first establishment of settlements in America, by the Spaniards, the ships of war of France proceeded across the Atlantic, not on voyages of discovery, but to intercept Spanish vessels, several of which had been captured by the French.

Canada is supposed to have been first discovered by the Spaniards, who despised the country; which they considered unworthy of settlement, as they had previously considered Florida of no value; because no gold was found in those regions. The country is even said to have derived its name from the two Spanish words *Aca Nada*,—here is nothing,—which the Spaniards exclaimed, and which

being repeated by the natives on the arrival of the French, the latter mistook the words for the name of the country, which they pronounced *Canada*.

Jacques Cartier, a mariner of St. Maloes, was commissioned by the French government to make discoveries, and establish colonies in America. He sailed in two vessels of about 20 tons each, from St. Maloes, in April, and arrived on the coast of Newfoundland on the 10th of May, 1534. He entered the Gulf of St. Lawrence on the festival of that saint, gave the name to the gulf which it still retains, and after exploring the greater part of its coasts and islands, he returned to France in the end of August.

On the following year he was invested with the command of three large ships, and arrived within the Gulf of St. Lawrence in July. He sailed up the great Hochelaga, or river of Canada, which he named the St. Lawrence. He explored the river as far as the island on which Montreal now stands. He was kindly treated by the natives, and he passed the winter in Canada. He returned to France the following summer. Yet, notwithstanding the favourable account he gave of the country, four years elapsed before another voyage was attempted.

In January, 1540, François de la Roque, Seigneur de Roberval, received a patent from Francis I., declaring him Seigneur of Norembegue (the name by which nearly all North America was then designated), viceroy and lieutenant-general in Canada, Newfoundland, and the adjacent countries.

Early in the summer of 1540, Roberval, with a squadron of five vessels, sailed for America, Jacques Cartier having the supreme naval command. They arrived at some part of the coast, and erected a fort; but whether in Cape Breton, or Canada appears uncertain. Cartier was left in command, while Roberval returned to France, but he was so harassed by the Indians, and despairing of Roberval's arrival, that he embarked with all his people for France. On the banks of Newfoundland, however, he met M. de Roberval with some vessels, carrying men, arms, and provisions; and returning with him, reassumed the command of the garrison. M. R. Roberval then sailed up the St. Lawrence, and landed at the mouth of the Saghunny. He made also some attempts to explore Labrador; but Newfoundland was not then known to be an island.

We have no information, on which we can rely, as to what took place for some years afterwards, until we find Cartier again embarking for America, under the viceroy Roberval. This expedition was never heard of after its departure; and for more than sixty years afterwards, the French government made no further attempt at discovery in America. The fishing ships of France, from the ports of Normandy and Brittany, continued, however, to frequent the fishing banks of Newfoundland, in common with the Basques.

Admiral Coligni projected the plan of an asylum for the French Protestants in some part of America, where they might establish themselves peaceably, and enjoy civil and religious liberty undisturbed. The whole of his plan, which

was directed chiefly to the formation of agricultural settlements, was conceived and arranged with wisdom: provided that those who were intrusted to carry his views into execution were able and determined to follow his instructions.

The plan of Coligni was patronised by Henry II.; and, it was afterwards, in reality, or feignedly, countenanced by that treacherous and heartless tyrant, Charles IX.

Nicholas Durand di Villegagnon, a Knight of Malta, and Vice-admiral of Brittany, abjured, or feigned an abjuration of the Romish faith, and assumed the profession of Calvinism. He had, for some time before, been treated with some contumely by the court; and, being chagrined in consequence, he, under the patronage of Admiral Coligni, projected in 1555, the formation of a great colony in America, as the asylum of all French Protestants. This happened when political, under the banner of religious, strife was preparing all the diabolical elements which were finally consummated by the massacre of St. Bartholomew.

Villegagnon was adventurous, brave, and so far accomplished, as to conceal his designs under a mask of simplicity and humility. He disguised his real views from Henry II. so well, that the latter allowed him to depart on a voyage of discovery with three vessels of his fleet, in which, however, the vice-admiral contrived to embark a great number of Calvinists, with whom he arrived on the coast of Brazil, and there landed on a large rock near the tropic of Cancer, and at the mouth of the bay and river afterwards called Rio Janeiro. He removed from the ill-chosen rock to an island farther up the river. Here, by accident, he found a place easily defended from all attacks, and commanding the entrance to an unknown, but rich country. In a few days he erected a rude encampment; and then despatched two vessels to France, sending an account to the court of his success, and favourable position, accompanied by letters to Coligni, and by secret letters to Geneva, in which he pretends entire submission to Calvin, as the greatest apostle of Christianity since the days of St. Paul.

Calvin and the synods of Geneva, on receiving the letters of Villegagnon, seized with ardour the opportunity of sending their persecuted disciples, and partisans to a country, which promised all that could be desired for establishing settlements, in order to enjoy that religious, and civil liberty, which was denied them in France.

An old Protestant gentleman, of esteemed zeal and prudence, Phillipe Dupont, of Corquilleroy, near Châtillon sur l'Oing, a neighbour and friend of Coligni, was recommended by the latter to conduct the Calvinists to Brazil.

This expedition consisted of several adventurers of distinction, with the Pastor Richer, and other ministers of religion, and many followers. In all, 296 persons, including only six women, embarked at Honfleur, on board of three ships, under the command of Vice-admiral Bois-le-Comte, a nephew of Villegagnon.

They encountered and survived a great tempest in the Bay of Biscay. Soon

after, in fair weather, they met with several Spanish caravalles. Bois-le-Comte considered himself justified, by referring to, and on the authority of the Bible, to seize and plunder those less powerful vessels. On the 26th of February, all the ships arrived safely, and anchored on the coast of Brazil. The savages came on board, bringing with them, in their canoes, diverse kinds of refreshments.

Lery, a young Protestant, who accompanied this expedition, wrote an account of the voyage, and informs us in the quaint language of the French Calvinists of that period, of their reception by Villegagnon : which was as austere as that of the New England Puritans, in the manner and language, and in the rigidity of religious service. He compelled all those who arrived to labour hard, for six weeks, in constructing a fort, and he exacted the observance of a more puritanical form of worship than that promulgated by Calvin. When the fort and other buildings were sufficiently complete, the faith of a *ci-devant* doctor of the Sorbonne, named John le Cointa, who had accompanied the expedition, was suspected. He was, therefore ordered to make a public confession of his belief. Le Cointa, says Lery, gave, on the sacrament day, this satisfaction to the spectators ; Villegagnon affecting, as usual, great zeal, then rose, and declared that neither the captains nor crews of the vessels, or others who would not make a similar declaration of faith, were worthy of partaking of the Holy Sacrament, and he accordingly commanded all such to withdraw from the place of worship. This order was readily obeyed. Villegagnon then announced, in a loud affected voice, that he was about dedicating his fort to God, and, kneeling down on a velvet cushion, which was carried behind him wherever he went, by a page, he read, in a loud voice, two prayers of his own composition, and then advanced the first to receive the Sacrament.

Next day he despatched a vessel with letters and 12 Indian youths, all under 10 years of age, whom he had taken prisoners, to France, where they arrived safely. The boys were presented to the king, as natural curiosities, and Henry gave away *les petits infidels* to divers ladies of his court.

Among the emigrants brought out to Fort Coligni were five young girls, no more, says Lery, could be induced, either by the eloquence of Calvin, or Villegagnon's flattering accounts of Brazil, to leave France or Geneva ; Villegagnon married two of these to two of his servants. The converted Sorbonne Doctor Cointa married a third, the relative of a Rouen merchant, who accompanied the expedition, and who, dying of the climate, left her all his goods. The other two girls were married to two Normans, who had been formerly wrecked on the coast, and from living among the Aborigines, learned their language. There was, independently of others, one great vital drawback, even under better management, to the prosperity of the colony. This was, if permanent settlement could have been contemplated, that the colonists were not accompanied by their wives and families, as was the case with the Pilgrim Fathers in New England.

But there was another cause which frustrated the success of a colony in a region most happily chosen. In order to maintain submission to his command, and, under pretence of maintaining the doctrines and the rigour of the principle which he professed, Villegagnon, like Calvin and many others, stained his name with acts of intolerance, and cruelty, which were ill calculated to insure successful colonisation.

Lery accuses him of the darkest designs, and Villegagnon, at last, altered his creed, and denounced Calvin as a wicked heretic, devoid of the true faith; and, this once declared, he expelled all Calvinists from his settlement: most of whom, after severe treatment, accompanied by Dupont de Corquilleroy, who had brought them to Brazil, sailed for France, and after great suffering during a long voyage, many dying of famine, they arrived at Rochelle, where they were hospitably received by the Protestants.

Villegagnon, who was surnamed the Cain of America, abandoned that country; re-assumed the profession of Catholicism; became an active persecutor of the Calvinists, and died 1571, in the *Commanderie* of the Order of Malta, in Gâtinois, near St. Jean de Nemours.

Thus was the first attempt of France at colonisation, ruined by the conduct of one bad, vain man, in whom the unsuspecting Coligni had placed confidence.

The grand admiral of France did not however relinquish his plan of colonisation. He abandoned Brazil, and turned his views towards Florida.

Charles IX., who probably conceived, that Coligni's scheme of colonisation might finally enable the tyrant to expel all the Huguenots from France, consented so far as to allow the admiral to fit out two vessels, which sailed for America, under the command of Jean de Ribaut, of Dieppe, in February, 1562.

This expedition arrived, in May following, off the coast of Florida; and sailing northward, and landing at various places, in order to choose an advantageous situation for a settlement, he selected the site of a small deserted fort, or camp, and named the place Fort Charles. He then arranged the plan for future settlement, and leaving behind all the volunteers to be governed by a chief officer, and in accordance with the instructions of Coligni, Ribaut sailed back to France to procure necessary supplies, and to bring additional colonists to the settlement: he arrived at Dieppe in the end of July.

The officer whom Ribaut had left in command at Fort Charles, unfortunately proved a man of suspicious and brutal character. He hung one soldier, with his own hands, degraded another, and punished several on the grounds of mere suspicious faults. The colonists at last turned upon the tyrant, executed him, and elected a better man. Civil war, however, broke out in France: Ribaut was unable to return with supplies, and the colonists in despair abandoned Florida.

In 1564, a third attempt was made by Coligni. Two ships under the com-

mand of Laudonier, who, with the crew and colonists, were all Protestants, sailed for Florida, where they arrived in June that year. He constructed a fort which he called Fort Caroline, and the forefathers of the very Red Men, upon whom, in the year 1840, were let loose bloodhounds to hunt them out of Florida, received Laudonier with hospitality and friendship. They supplied him generously with maize, flour, various esculent roots, and abundance of venison. Sometimes these presents were accompanied by small pieces of gold and silver, and pearls and precious stones. Laudonier was a wise, cool-headed man; but many of his companions, especially those of genteel families, expected to make fortunes without labour; and when he insisted on all aiding at the necessary works, some mutinied; but instead of punishing them he sent them back to France. He did not then know the extent of dissatisfaction which had prevailed. Gold and silver, not the laborious formation of permanent agricultural settlements, were what most of the adventurers looked for, but did not find in Florida. In a few days thirteen sailors deserted with one of his provision boats; two carpenters escaped with the other and only provision boat; and six others revolted openly and became corsairs. They seized upon the person of Laudonier, forced him on shipboard, drew up a commission of aggression against the Spaniards, which they compelled him to sign, while they held a poignard to his breast. They sailed towards the Spanish settlements, the vessels separated, and one of the ships commanded by the rebels, captured a Spanish vessel laden with wine and other merchandize, near Cuba; they captured another, which the pirate commander made his flag ship, and soon after captured a third, which had on board the Spanish governor of Jamaica. For this personage a large ransom was demanded, and the governor's son was sent to bring it from the governor's wife. A letter was, however, given privately to the boy to deliver to his mother, telling her not to send the money, but that a force should be sent to recapture him. Two days after, the French pirates were attacked by three large Spanish vessels. The governor and the principal vessel were retaken, one of the vessels escaped, but getting into the stream was carried back towards Fort Caroline, where the crew was captured by Laudonier, who had managed to return, and four of the leaders tried and executed.

Famine, however, at last menaced the existence of the remaining colonists; but they were unexpectedly saved by the appearance of an English vessel, which anchored near the coast, and supplied them with food,—and soon after by the arrival of Ribaut, and seven ships with supplies from France.

Affairs now seemed in a prosperous train, and the difficulties of forming a colony were considered overcome. But the pride and jealousy of the Spaniards could not bear the existence of a French colony in America; and Menendez was sent, during peace, by Philip II., to exterminate the French Protestants in Florida. The squadron sent by Spain was part of the fleet, which had been equipped to succour the knights of Malta against the Turks. The expedition arrived

safely at Fort Caroline; the fort was invested by a strong force and soon captured. Ribaut escaped with his squadron, and Laudonier escaped, also, by sea with a few others. Some fled into the interior among the Indians, who received them with hospitality. Those who were taken in the fort, or who, rather than follow Laudonier, surrendered in the hopes of their lives being spared, were hung by Menendez on the adjoining trees, where they were left suspended, with placards bearing the inscription, "THESE WRETCHES HAVE BEEN EXECUTED, NOT AS FRENCHMEN, BUT AS HERETICS."

To close the calamity, Ribaut's squadron was wrecked on the Bahamas. The crews were saved; but it was afterwards discovered that they fell into the hands of the Spaniards, that they were bound four and four, and then massacred upon the spot. Ribaut and his chief officer are said, by some accounts, to have been flayed alive, and their skins sent to Spain. The Indians who visited Fort Caroline, were accused of sheltering the French, and were, on that account, hunted and shot like wild beasts by the Spaniards.

These horrible murders excited the indignation of all France, except that of the execrable Charles IX. and his minister, who rejoiced secretly at the annihilation of Coligni's projects of colonisation: which the wicked king had feignedly approved of, but which he hated, because it was conceived by the chief of the Huguenots.

Intreaties and memorials to punish the Spaniards were sent from all parts to the king and minister, who heeded neither the lamentations of the widow, nor the cries of the orphan;* and who, with the delighted court, merely viewed the massacre in Florida, and that of Ribaut and his men at the Bahamas, as the extermination of the partisans of Admiral Coligni. The nation, however, breathed vengeance; and this spirit gave birth to one of the most adventurous of the expeditions to the new world.

The hero of this expedition was Dominique de Gourgue, a gentleman of distinguished family of Mont Marson, in Gascony, and a captain in the royal navy. During an action of extraordinary gallantry, as a subaltern officer, heading a small troop, against the Spaniards in Italy, he advanced until all his men fell around him. Being then made prisoner, the Spaniards, regardless of all the laws of honour and of war, chained him to a galley as a slave. This galley was soon after captured by the Turks, and sent to Constantinople, but De Gourgue was still in slavery, and still chained to the galley, in which, however, he was, in a short time, sent with a flotilla against the Knights of Malta. The galley was retaken by the latter, and our hero regained his liberty.† He afterwards, in a ship of the royal navy, made voyages to Africa and Brazil, and acquired, on his return to

* One of the memorials, or papers, presented to the minister of Charles IX., was entitled, "*Supplique des veuves et des enfans de ceux qui avaient été massacrés à La Floride.*"

† There is a singular coincidence between the early life of Captain John Smith, the real founder of Virginia, and that of De Gourgue.

France, the reputation of being the most hardy, gallant, and skilful navigator of the age. This occurred, when the public indignation against Spain was shared by all, except the court; and when no one seemed able to chastise the crime of the Spaniards.

Fired with patriotism, and ambitious of distinction in perilous enterprises, De Gourgue sold his estate,—built and equipped three ships,—chose a band of gallant men,—sailed with them to Florida,—attacked the fort of the murderers,—drove them from their posts,—and with extraordinary bravery, and after great slaughter, captured the fort, and, in order to oppose one derision to another, hung the prisoners to the limbs of the *adjoining trees*, on the trunks of which he carved, “*Hung, not as Spaniards, but as assassins.*”

This intrepid Gascon returned to his country the same year (1567). From that day France seemed to have forgotten the new world. The nation was involved in a chaos of dogmas, and in the frenzy of religious and political fury—all were ready executioners,—each was considered a criminal by the other,—each condemned the other to the flames of eternal wrath; and the massacre of St. Bartholomew, and the murder of Coligni, are more disgraceful to the Christians of Europe, than all the atrocities that have ever been laid to the charge of the Red nations of America.

CHAPTER XI.

ABORIGINES OF NORTH AMERICA.

BEFORE we proceed to give some account of the colonies of France and England, in North America, it will be necessary, for the purpose of elucidation, to introduce a brief sketch of the Aboriginal inhabitants. The original peopling of America, to which we have already adverted, in our short account of Mexico and Peru, forms one of those perplexing inquiries which human research seems never likely to solve. We have no historical data to guide us. Chronology, and scriptural records, are confined to the world, as known to us before the fifteenth century, and all opinions respecting America, before that period, are speculative, and end only in conjecture.

The origin of the natives, and that of the wild animals, found on the smallest islands of the Pacific, are equally enveloped in mysterious darkness; and we know only *the fact*, that there is scarcely any part of the globe, which affords sustenance for man, on which beings of the human species have not been found.

Events which, in the history of Europe, appear as belonging to an age little older than that in which we live, are, in point of time, coequal with those, in the

annals of the western hemisphere, which, when we read, appear as if they belonged to ages remote, and, in respect to North America, certainly as that of man in the first stage of society. We refer to the period, when the coasts of that wild empire were first visited by Europeans,—when its vast regions, were covered with those boundless, dense, and splendid forests which still, with the exception of trifling patches cleared by Europeans, and of the Savannahs and buffalo prairies of the far west, commence at the shores of the Atlantic, and from thence continue, branching luxuriantly over the banks of rivers and lakes, or, extending in stately grandeur over the plains, and stretching proudly up to the summits of the mountains, until those magnificent sylvan domains terminate, only, where the surges of the Pacific bound their limits.

Notwithstanding the advances of Europeans on the waters and hunting grounds of the red nations of America, we do not yet, in many of the most extensive territories, observe the progress of improvement, nor any sign of what we consider civilisation. There the sublime landscape, reigning in its natural luxuriance, exhibits, in its primeval wildness, the same scenery as prevailed over all North America two centuries and a half ago, when none but the native hunter traversed its solitudes, and no vessel, but the white canoe of the red man, navigated the waters of its inland seas, rivers, or oceans.

The Aborigines of America, north and east of Mexico, have been, and are still, a far bolder race than the Mexicans or Peruvians appear to have been when conquered. As to civilisation, the North American Indians* were, in many respects, far less advanced than either the Mexicans or Peruvians. Those of North America consisted nearly altogether of nations of hunters and fishers.

In describing the character, the capacities, or deeds of the American Indians, and before we accuse them of barbarism, cruelty, or of treachery towards Europeans, let us pause and ask, whether Europe has been guiltless, during the period that has elapsed since the year 1604—that in which the first permanent European settlement was established in North America?

In England, we find Raleigh judicially assassinated by order of a base sovereign, to satiate the blood-thirsty court of Spain; then came the civil war; then the debaucheries of Charles II.; then the bloody judgment-halls of James and Jeffreys; and, later still, the treacherous massacre of Glencoe. Neither can humanity nor *Christian charity* look over the murderous pages of Irish history without horror. And if we turn to our transactions in the East, avarice, cruelty, and rapine leave little that shines purely in English conduct. Without expatiating on the burnings in Smithfield, or the massacre of St. Bartholomew, if, in Paris, we walk along to the end of the Rue St. Honoré, and halt and sympathise at the

* This designation we confine to the natives north and east of Mexico, including the natives of Florida. The name of America, and that of calling its inhabitants Indians, are both unjust; but usage has established terms, which we are compelled to adopt.

very house in front of which the first and the best of the Bourbons was assassinated; and then return to the Place de Grève, to the Place des Victoires, to the Place Carousal, to the Place de la Concorde, or to the Boulevards,—at every step, we tread over ground, which has been brutalised by murders, executions, and butcheries, from the earliest days of the capital of France, with little intermission, until within the last ten years, when, in order to murder the king and his family, a dark atrocity, of infernal conception, and fatal execution, was perpetrated in the open day, and in the full front of twenty thousand troops.

If from Europe we traverse the Atlantic to the shores of North America, and glance at the deeds of the red heathens, while the civilised whites have been massacring, drowning, burning, and assassinating each other in the land of Christianity, of learning, and of politeness, we will find that what we have termed savage barbarism, has not been more base, or more cruel, than the deeds perpetrated under the sanction and direction of, what we have arrogated to Europeans as, civilisation.

On the discovery of America, and on the exploring of the country by the several navigators, who succeeded Columbus, all those regions, from Hudson Bay to Patagonia, were found to be inhabited by a people who, with the exception of the Esquimaux, seem to have been of the same race. Under the torrid zones and the northern regions, the features, forms, and shining olive complexions of the Aborigines are nearly the same.

Columbus, in describing the native Americans to Ferdinand and Isabella, says, “I swear to your majesties that there is not a better people in the world than these—more affectionate, affable, or mild. They love their neighbours as themselves. Their language is the sweetest, the softest, and the most cheerful, for they always speak smiling; and although they go naked, let your majesties believe me they are very becoming.”

Whatever was the condition and character of the natives of North America three centuries ago, when the forests, prairies, lakes, and rivers, were theirs; and when they formed patriarchal tribes or families of hunters, it must have been happy in comparison with the state of deplorable wretchedness, to which European civilisation has subjected them.

To assert, as some European and American writers have done, that the Indians of America are *incapable of civilisation*, would be uttering the most gross absurdity ever advanced.

Unless he be maddened, or besotted, by the intoxicating fluids introduced from Europe, the Indian of North America in his undegraded state, as he may still be found in the far western forests, is a truly dignified and majestic personage. The graceful, the grave, the naturally taciturn, but, on the proper occasion, the eloquent gentleman of nature—the

“Stoic of the woods, the man without a tear”—

whom Europeans, and especially the Anglo-Americans, have not only wronged, but to injustice added that galling, disdainful contempt, which hath festered in his proud soul ; and which, with the repeated aggressions that have deprived him of his beautiful country, the forests of which once afforded him abundant game, and in the rivers of which he alone fished, have nurtured eternal, unforgiving hatred in his heart towards the white man. No wonder that he pines away in silent anguish, while he beholds his tribe melting away before the advancing encroachments and prosperity of Europeans.

We have, in the first chapter of this work, said that the right of the Indians to their country was founded in nature and immemorial occupancy—that the free and bounteous gift of Heaven was their tenure. But the dark superstition of the times claimed the Deity as the God only of Christians ; and the Spaniards, and even our Elizabeth and James, made this monstrous doctrine their measure of right, in wresting all the territories discovered by their subjects from “*the infidels.*”

We have shown that tribes, however numerous, who were unacquainted with the use or power of fire-arms, and who looked upon their invaders as spirits sent forth by the gods of thunder, were suddenly terrified, and subdued with feeble resistance. We have also exposed the cruelty and treachery of the Spaniards, in Cuba and in South America, as admitting of no parallel in the annals of perfidy, and as redeeming the savage state of man from the charge of being more cruel, base, and unprincipled, than that of the refined European.

The French and English, by their avarice in trade, excited the Aborigines to slay each other ; and introduced among them the most terrible exterminators, in the form of gunpowder, brandy, and small-pox.

The missionaries, of the two great divisions of the Christian faith, had early ventured to the savage encampments, but the Jesuits were the first who penetrated far into the wilderness. Among all the aboriginal nations of America, it has always been considered inhospitable, and ill-mannered, not to listen respectfully to what strangers relate ; and although they might not comprehend, nor credit what was said, they were so well-bred as never to tell the narrator they did not believe him. The courteous manners, and policy of the Jesuits, were exceedingly accommodating to the Indians, in this respect, while those of the rigid protestant missionaries were as opposite to the tempers and ideas of the “*Stoic of the Woods.*”

The protestant preacher came among them relating the historical passages of the Scriptures, and then inculcating the Calvinistic doctrines of Christianity. The Indians, according to Dr. Franklin and other writers, listened patiently until the preacher finished, and then observed “that apples were not wholesome, and that those who crucified Jesus were bad men.” They then related their own traditions of the creation of the world and of man, of beasts, birds,

and fishes. The protestant missionaries replied, "These stories are *idle fables*, and not to be believed." The Indians answered, "We have better manners than you have, for we have heard with patience what your mothers told you, and we were not so rude as to say that you did not speak the truth. We have, in our turn, related to you what our mothers told us, and you say, that we repeat only '*idle fables*.'" "

Such was usually the result of the interviews which the protestant missionaries had with the savages of America ; consequently, they scarcely ever succeeded in making converts ; at least, not until a long period after the settlement of the old colonies ; and then, only of such degenerated Indians as loitered about the towns, and had become first degraded by drunkenness, and other European vices.

The Jesuits, and other catholic missionaries, listened patiently to all the Indians said, and denied nothing ; they related passages of Scriptural history, avoiding carefully the points most difficult of comprehension ; and, in place of reprobating the habits and manners of the Aborigines, the catholic missionary adopted the savage life. The showy forms of the catholic service were also attractive to the Indian fancy ; and the pictures and images, exhibiting the torturous death of the crucifixion, were in full accordance with savage feeling.

When the barter trade, from its greater profits, with the colonists of New York, allied to the latter the Iroquois, or Six Nations, the hereditary enemies of the Algonquins and Hurons, and when the English and French were at war, the Jesuits, who, generally speaking, were the best friends of the Aborigines, are accused of having circulated, in the Indian language, an ingenious political sketch of Scriptural history, in the form of question and answer. This was called the *Black Catechism*—a diabolical category denounced by all other catholic missionaries, and differing in the form of its questions and replies, so as to suit the nations among whom it was distributed. That drawn up for Paraguay was in many parts different from those circulated on the Wabash, and in Louisiana. The answers were framed to correspond with Indian sentiments. For example :—

"Q. Who crucified Christ ?—A. The English, when he was on his road to assist the Shawanees and Hurons to destroy the Iroquois."

With the exception of the Six Nations, and the tribes conciliated by the admirable and wise conduct of William Penn, the tomahawk of the red man has therefore, from the foregoing, and other causes, seldom without just provocation, been wielded against the Anglo-American : and when the French colonists of Canada came under the government of England, the Hurons, Shawanees, and their allies, remained in amity with the former, and with the English who settled in Upper Canada, although they committed frequent hostilities on the English of New York.

The colour of the Aborigines of America is a shining olive, not exactly a copper colour, as is usually stated. The stature of the men is generally not under five feet nine inches, and often six feet. Their persons are symmetrically proportioned, never corpulent, and their hands and feet are small and finely formed. The lower part of the face is angular; the upper part rather broad; the forehead finely shaped; the eye deep-set, black, quick, and piercing; the upper part of the cheeks prominent; the nose rather short, often with a little of the Roman form; the teeth remarkably white, and scarcely ever subject to decay; the hair dark, sleek, and shining—it never curls: they have little or no beard, or hair on any part of the body, except the head. The aspect of the Indian is stern and dignified, and his looks suspicious. He is taciturn, thoughtful, and distrustful in making his replies.

The women are rather of low stature, naturally of delicate forms; but, being domestic drudges, become thick waisted, and coarse looking as they advance in years.

There is an extraordinary difference between the natural disposition of the North American Indian and that of the African negro. The latter, sullenly it is true, submits to slavery; the former disdains the most slender idea of servitude. Rather than submit to compulsory labour for others, he will endure the most excruciating and prolonged torture, without uttering a complaint, or exhibiting a convulsion.

Their ties of friendship have been lasting, between man and man, among the Indians. An Iroquois, who was a Christian, but not living according to the precepts taught him by the missionary, was threatened with future damnation. He asked if his friend, who died some time before him, was in hell? The missionary said "No." The Indian replied, "Well, then, I won't go there."

They were, and have continued to be, very superstitious, and believe in dreams, apparitions, and all their jugglers tell them. Their language is metaphorical, harmonious, bold, and energetic. In its intonation, emphasis, and tones, it resembles Greek more than any of the languages of the old world. Revenge is their dominant passion. Like Homer's heroes, they believe that the shades of their departed friends call for revenge; and they conceal their purpose for years, if a proper opportunity does not offer to satiate their resentment. They consider that our manner of bringing up youth would be useless to them. They never punished their children. To their enemies they have been malignant, cruel, and inexorable: to their friends they have been steadfast in their attachments. They have had little gaiety of disposition; and their music and dancing was wild and passionate.

At no period do they appear to have had any acquaintance with the sciences. When North America was discovered, they had neither forges, ploughs, nor looms. Bark canoes, or wooden ones hollowed out by burning; fishing-hooks, made of bone; and lines, made of the entrails or skins of animals; clubs, hard-

ened in the fire ; lances, armed with flint or bone ; bows, with arrows pointed in the same way ; hatchets and chisels made of flinty or hard stones ; bark and wooden dishes ; and skins and furs cut and sewed for clothing, were the articles which they made. The gun, tomahawk, and scalping-knife, have since been substituted for the bow and lance.

Their architecture arrived at little more than rude erections : and conical wigwams, covered with the rinds of trees, have constituted their dwellings.

They esteemed labour as slavish and base. They cared not for riches ; and whatever they had they consumed, without adding to their stock : depending on the chance of success, in hunting or fishing, and on what little maize their women cultivated, for future provision.

They were, and, in the wilderness, still continue, hospitable to strangers, and they gave a share of their food and habitation freely ; but when they entered the houses of Europeans, they seldom met with the same kind treatment ; and, to the everlasting shame of Christians, they have treated the Indian as if he were not of the human race, or not under the protection of the same God !!!

Order and gravity have always prevailed at their councils : in which, the old men occupied the first, the warriors the next, and the women the third places. The latter listened attentively to all that passed, registered it in their memories, and transmitted it to their children. While an orator spoke, the assembly listened with profound silence, and when he had finished, a little time was allowed to elapse to leave him the opportunity of recollecting any thing he might have omitted. Their speeches were grave and deliberate ; they never interrupted a speaker ; and, in conversation, never contradicted one another. They listened in patience, and seemed, by their not contradicting what was told them by strangers, to assent to the opinions of those who spoke. The missionaries have often been misled into the belief of having converted the Indians, when they have only listened, without dissenting, from an hereditary rule of politeness.

Eloquence in council, and courage in war, were their ruling passions ; and the irresistible motive for war was revenge. When young, they were hunters and warriors, when old, they became counsellors. They were not averse to social life ; but the feeling of independence forbade all compulsion ; they could only be influenced, not commanded. The hunting Indian would scarcely work for any reward ; it sunk him from what he considered the high condition of a huntsman, warrior, and statesman, to that of a slave or mechanic. The love of independence, the great instinct of their nature, was paramount to every consideration with the Aborigines of America, north and east of Mexico.

To guide a canoe, to fish, hunt, and fight, were their necessary acquirements. Their talents were oratory, address in negotiation, patience, and travelling long without food. Their war chiefs acquired an ascendancy by a fierce aspect, and a strong and terrible voice ; but eloquence and daring exploits were still greater recommendations.

In negotiations they used collars or belts of wampum, about three feet in length and six inches in breadth, and ornamented with small shells. No transaction could be entered into without the intervention of these belts, which served, in the absence of writing, the place of contracts or obligations. They preserved them for many years, and their distinctive marks were well known to their sachems or elders. To raise the hatchet was to proclaim war; to bury it was to enter on terms of, or to conclude, peace.

Such were the leading characteristics of the original inhabitants of North America; and such are they in many aspects in the countries west of the Mississippi and the great lakes, except where the fur traders have corrupted them by increasing their wants, and teaching them the tricks of bargain-making; and by persuasion and example, have made them more sensual, immodest, and unchaste.

We shall, in another part of this work, appropriate a chapter to the present state of the Aborigines of America, after a collision of nearly two hundred and fifty years with Europeans.

CHAPTER XII.

SETTLEMENT OF ACADIA, OR NOVA SCOTIA, BY FRANCE.

IN 1603, M. de Monts, a French protestant, and a gentleman of enterprising resolute spirit, obtained a commission from Henry IV., constituting him governor of all the countries of America, from 40 to 46 degrees north, under the name of New France, which included Nova Scotia (then called Acadia).

Several French adventurers, who had previously visited Acadia and Canada, realised large profits by bartering European goods for furs. De Monts having secured by his charter a monopoly of the fur trade, associated with him several wealthy men. In March, 1604, De Monts, accompanied by Champlain, afterwards the celebrated founder of Quebec, Potrincourt, and many others, sailed with four ships from Havre, and arrived on the 15th of May at a harbour in Acadia, where he found a French adventurer, whose property he confiscated for trading without a commission. He called the port Rossignol, the name of the unfortunate trader. He then coasted westward to Port Mouton, where he landed and formed an encampment. He afterwards despatched one of his ships to Tadousac on the north side of the St. Lawrence, and the other two were ordered to cruise along the coasts of Cape Breton, the island of St. John and Acadia, in order to prevent unauthorised adventurers from trading with the natives. De Monts then sailed to the westward, and traversed the shores of the Bay of Fundy, which he named La Baie Francoise; and by the narrow strait, now called Digby Gut, on the east side, entered a beautiful and extensive basin;

with which, and the surrounding prairies and luxuriant woods, Potrin-court was so much charmed, as to select it for his place of settlement. He accordingly received a grant of it from De Monts, named it Port Royal, and soon after returned to France, for the purpose of carrying out his family, and the means of establishing himself in Acadia.

De Monts, meantime, discovered, on the west side of the Bay of Fundy, and on the festival of St. John, a large river which he named after that saint. He afterwards sailed southwards till he came to the river now called St. Croix. On a small island at the entrance of this river, he commenced forming a settlement. This place was most improvidently chosen. The water was unwholesome, and the country was not even the haunt of game. Thirty-seven of the colonists, out of the whole number, seventy-six, were carried off, during winter, by scurvy. This plague of the early settlements, was brought on by living on salt meat, and by having no water to drink but what was procured from melting snow. De Monts, after examining the coast as far as Cape Cod, in search of a more eligible situation, abandoned St. Croix, and removed, along with Pontgrave, who had arrived with supplies from Europe, to Port Royal. In this place they soon established themselves; and with the usual success of the French in negotiating with the savages, secured the friendship of the Indians. De Monts sailed for France in the autumn of 1605, leaving Pontgrave, Champdore, and Champlain in the command of the colony.

De Monts arrived during the following summer, after a tedious passage, at Canseau, from whence he despatched a party of Indians to communicate his arrival to the settlers at Port Royal.

Notwithstanding the energy and perseverance of De Monts, the settlement at Port Royal would have been abandoned, were it not for measures pointed out by Lescarbot, a gentleman bred to the law, but who, from personal attachment, accompanied Potrin-court. He showed the earnest necessity of importing, and breeding, domestic cattle, and of cultivating the soil, in order to become independent of the Indians for food, or of the chances of not receiving supplies of provisions from Europe. The settlers would then, he contended, be more secure in trading with the natives, by living more compactly, and not subjected to the precarious means of subsistence, which hunting alone afforded.

De Monts left Acadia for France, in August, 1606. Still anxious to establish a colony further south, he despatched Potrin-court, in another vessel, to explore the country to the southward of Cape Cod; but this, like his former voyage, was quite unsuccessful; and he returned to Port Royal in November, where he was received with great joy, friendship, and respect, by Pontgrave, Lescarbot, and Champlain.

The winter being remarkably mild, and the spring early, those enterprising men appear, from Lescarbot's account, to have passed their time most agreeably and sociably. At their principal mess-table, Pontgrave, Champlain, Les-

carbot, and twelve others dined, taking upon them the offices of president and caterer in daily rotation. They occupied themselves by making short hunting excursions, and, by employing their people, in building two small shallops, and erecting a mill. After waiting a long time for the arrival of De Monts with supplies from France, a vessel at last appeared from Canseau, bringing only a few provisions and stores, and the mortifying information that the charter of De Monts was revoked, in consequence of the remonstrances made against it by the French merchants ; and, that he was therefore under the necessity of relinquishing all connection with Acadia.

Potrincourt, distressed, but not disheartened, on receiving this intelligence, at a time when the colony was so far established, that nothing but an undisputed right to the soil, and some further assistance in the way of supplies, were necessary to ensure its prosperity and permanency, resolved to return to France, for the purpose, if possible, of obtaining both. He did not leave, however, until he was enabled to carry with him samples of wheat, and other agricultural produce, some native animals, and several specimens of minerals, which, on his arrival in France, he presented to the king.

He obtained a grant of Port Royal, with the disagreeable stipulation, to provide for two Jesuits, who were to accompany him, for the conversion of the savages. On his arrival at Port Royal, he resolved to exclude them from any interference with his affairs, and told them, "That their duty was limited to teaching men the way to Heaven, and that it remained for him to govern and direct those under him on earth."

Potrincourt was, however, very indiscreet in despising them ; for their complaints against him and his son, Biencourt, were readily believed in France ; though apparently terminated by the arrival of a vessel, despatched in 1613, by the patroness of the Jesuits, a pious lady, of the name of De Gaucherville. This ship, having on board two priests and some emigrants, carried away the Jesuits from Port Royal, and sailed down the Bay of Fundy, to the island of Mount Desert, which lies a few miles north of Penobscot Bay. Here they erected a cross, and set up the arms of their lady patroness. They named the place St. Saviour's. While erecting suitable buildings, and preparing the ground for cultivation, they were surprised by an English ship of war, from Virginia, commanded by a Captain Argall, who pillaged the place, and compelled them to surrender as prisoners of war, for having encroached upon, and settled on a place asserted by the English to be within the Virginian limits. One of the Jesuits was shot through the head, while urging the settlers to defend themselves ; two ships, that lay at anchor, were seized, in one of which most of the prisoners were sent to France, and the others were carried to Virginia.

A second armament was then sent from Virginia, commanded by Argall, for the purpose of destroying the French settlement in Acadia. Argall, piloted by

one of the Jesuits named Beart, proceeded to Port Royal, which was then commanded by Biencourt, the son of Potrin-court. The fort was levelled, but the mills and corn-fields were spared; and Biencourt attempted to treat with Argall, by offering him an equal share in the trade, under the protection of England. He required also that the person of the Jesuit, Beart, should be delivered over to him; but the negotiation failed, and some of the French associated themselves with the natives, others escaped and fled to Canada to join Champlain, and the remainder were sent as prisoners to England.

This outrageous destruction of Port Royal, during a time of profound peace between England and France, could never be defended on the slightest ground of justice or provocation; and must be attributed principally to the thirst for plunder, and to religious bigotry. By this atrocious violation of private property, the first settlement made in North America was destroyed in 1615, after prospering for ten years, and without experiencing a share of that ferocious opposition, from the natives, which proved so fatal to the early attempts of England at colonisation.

In 1621, when Sir William Alexander obtained from James I. one of those charters, which assumed very disputable rights, and which granted him the whole territory of Acadia, the name of the country was changed by that authority, and called Nova Scotia. Sir William was an accomplished gentleman, of high literary attainments, the author of several tragedies, and much about the court of James I., who afterwards appointed him a secretary of state, and created him a baron, with the title of Viscount Stirling.*

During the summer which followed the date of his patent, Sir William despatched a vessel with a small colony for Nova Scotia, which had to winter at Newfoundland, but proceeded to Nova Scotia in the spring, and then returned to England without making any attempt to establish a settlement. A most Utopian account of the country, and climate, was published from the descriptions of those who had performed the voyage.

From the time Port Royal was destroyed (1623), great numbers of French and Dutch adventurers resorted to the province, where they carried on a profitable fur trade, as well as a fishery at Canseau and other harbours.

The war with France, however, in the early part of the reign of Charles I., completely crushed the French plantations in Acadia, and that monarch not only confirmed the grant to Sir William Alexander, but instituted the order of Barons in Nova Scotia.

In 1627, Sir William Alexander, assisted by a French Calvinist of the name

* Charles I., confirming the charter of King James I., added all Canada, and the greater part of the countries now forming the United States. Both sovereigns had almost an equal right to grant territories in China; for neither did Nova Scotia or Canada cease to be possessed by France until we finally secured both countries, the first by the treaty of Utrecht, in 1712, the latter by conquest, in 1760, and by the treaty of 1763.

of Kircht, who fled to England from France, to escape religious persecution, fitted out a few vessels, well armed, for Nova Scotia.

These vessels captured, on their way, a fleet of French transports laden with stores and 135 pieces of ordnance, intended for Quebec and Port Royal. In the following year he reduced Port Royal (which had been partially re-established).

No settlement was however made at this period; and two years after Sir William Alexander, discouraged at the failure of his attempts to colonise Nova Scotia, transferred the whole, except Port Royal, to Claude de la Tour, a French Protestant, who was on board the transports, when captured by Sir David Kirk (Kircht). This gentleman possessed wealth and talent. While in England, after his capture, he married a lady of the queen's household, and was knighted.

He proceeded to Nova Scotia, where his son Etienne, by a former marriage, still commanded a fort at Cape Sable, on the part of France. His father, however, could not induce him to submit, and in consequence Sir Claude returned to England without being able to form a settlement.

The treaty of St. Germain, in 1632, ceded Nova Scotia, with Cape Breton and Canada, to France; and a long train of unfortunate circumstances attended the American colonies in consequence.

These possessions were then placed under the government of a company of merchants, embodied by royal charter, and styled the company of "New France," under which Acadia was governed by M. Razillais.

The lands of the colony were divided principally between the governor, whose share fell to his successors, M.M. Charnisè, Denys, and Etienne de la Tour.

The jealousy of Charnisè and La Tour, arising principally from rivalry in the fur trade, partook for many years of a similar spirit to that which directed the predatory warfare of feudal chieftains; and M. Denys, who occupied the country from Cape Canseau to Gaspè, and who built a fort, and resided at Chedebucto, where he carried on a profitable fur trade, was finally ruined and driven from the colony by the intrigues of his countrymen.*

De La Tour's principal establishment was on the river St. John. His wife appears, from the records of that period, to have been a woman of extraordinary

* In 1634, La Tour arrived at the harbour of Boston, in a ship having 140 men on board; the master and crew of which were Protestants of Rochelle. He stated to the governor that his fort on the river St. John was besieged by his rival, and that he had come for the purpose of seeking aid to remove him. Recourse was had to the Bible, as was usual with the Puritans, on all doubtful occasions, to discover, if possible, some case which would, by analogy, apply to La Tour, and furnish a rule for their conduct. On the one hand, it was said, the speech of the prophet to Jehoshaphat, in 2 Chron. xix., 2, and the portion of Solomon's Proverbs contained in chap. 26th, 17th verse, not only discharged them from any obligation, but actually forbade them to assist La Tour; while, on the other hand, it was agreed that it was as lawful for them to give him succour, as it was for Joshua to aid the Gibeonites against the rest of the Canaanites, or for Jehoshaphat to aid Jehoram against Moab, in which expedition Elisha was present, and did not reprove the King of Judah. These conflicting authorities divided their councils; and though either course was sanctioned by Scripture, it did not appear that there was any certain rule on the subject, while the safest course was to adhere to the old maxim, "*Dubia causa bellum non est suscipiendum*."—Haliburton's *Nova Scotia*, p. 54.

high mind and heroism. In 1654, an armament, despatched by Oliver Cromwell, conquered the province. La Tour transferred his allegiance to England, and two years after obtained a grant of his lands from the Protector. He afterwards sold his lands and property in Nova Scotia to Sir Thomas Temple, who, after forming establishments, was, most unjustly, deprived of the whole by the treaty of Breda, which ceded the province again to France.

In 1690 an English squadron, commanded by Sir William Phipps, retook Port Royal, levelled its fortifications, and burnt the establishments at Chedebucto. The object of this expedition appears to have been more to annoy and pillage than to possess the country. Some aggressions on the part of France, who still occupied her usual places of resort for the fur trade; and the demolition, by Villebon, the French governor, and the Baron Castine, reinforced by two ships of war, of the English fort at Perniquid, were resented by an expedition under the command of Colonel Church. He sailed up the Bay of Fundy, drove most of the Acadians to the woods; and, on the refusal of those who surrendered, to join the English in the pursuit of the Indians, this brutal fanatic burnt their church and all their houses, destroyed their cattle, and demolished the dikes which guarded their rich marshes from the sea.

Colonel Church, in 1704, with about 600 troops, pillaged a second time the French settlements in Acadia. He first burnt all the houses, and seized the property of the inhabitants at Passamaquaddy. He then crossed the bay to Port Royal, and sent the boats with a detachment to Minas, where they plundered and destroyed three flourishing villages. On their return to Port Royal, Church discovered that the fortresses, built since he destroyed the place eight years before, were too strong to be taken by the force under his command. He, therefore, sailed up the Basin of Minas, where he laid waste all the settlements, and carried the plunder to Massachusetts. The New England States, in 1707, raised a thousand troops, and with two ships of war, were sent to capture Port Royal; but they were repulsed with great gallantry by the governor, M. Subercase. The same force was sent again from New England to Port Royal, but they returned a second time equally unsuccessful.

The conquest of Port Royal was, however, determined upon; and in 1710, an armament, commanded by General Nicholson, an able and brave officer, consisting of four men-of-war, nineteen transports, with one regiment of marines, and four provincial regiments, appeared before Port Royal. With the exception of those on board of one vessel that was wrecked, the troops landed without difficulty. Batteries were immediately erected by the English; and after a heavy cannonading on both sides, the garrison capitulated. The conditions were honourable both to Nicholson and Subercase. The foregoing is a brief sketch of the very eventful history of Nova Scotia, from its first settlement by the French until its final conquest by the English. The Indians, however, continued to harass the

British settlers, and the French were accused of instigating the former in their atrocious cruelties. On the west coast of the Bay of Fundy, the Abenaki tribe were governed by Père Rallè, a Jesuit priest, and a son of the Baron Castine by a native woman. Castine was their cacique, or war leader, and he and Père Rallè resided at Norridgewauk on the Kennebec.

The unfortunate Acadians wished to remain neuter, and to live by means of husbandry and fishing, but a force was sent from Massachusetts to Kennebec, where the Acadians and Indians were attacked and defeated, and most of them slaughtered. The chapel, crucifix, and all that was considered idolatrous, were then destroyed, the goods plundered, and all the buildings set on fire.

Père Rallè was among the slain. He had lived forty years among the Indians as a missionary, and had long won their affection and secured their confidence. He spoke the English and Dutch languages fluently; and understood, and spoke all the Abenaki dialects. Occasionally he had controversies with the learned men of Boston, to whom he wrote in correct and elegant Latin.

Charlevoix says, "that although the good Father Rallè was unprepared, he was not intimidated; that he advanced towards the English to attract their attention to him, and to secure his flock by the voluntary sacrifice of his own life; but the moment he was known, the English shouted and fired a volley of bullets, which killed the venerable Jesuit and seven Indians, who rushed from their tents to shield him with their bodies. He fell at the foot of a cross which he had erected in the middle of the village, and when the pursuit had ceased, the savages returned and wept over their beloved missionary, whose body they found perforated with balls, with his head scalped, his skull fractured with hatchets, his mouth and eyes filled with mud, his legs broken, and his limbs horribly mutilated. They bathed him with tears, and buried his remains under the site of a chapel, where, on the evening before, he had performed the holy rites of religion."

The New Englanders, in their defence, alleged, that Baron Castine and Père Rallè, were those who instigated the Indians to hostility, as well in Nova Scotia as on the confines of New England, and that they were in direct communication with, and acting under the directions of, the Governor of Canada.

The hostile spirit of the Indians was not vanquished by the destruction of Norridgewauk, and it was asserted that the French colonists had never ceased to excite the savages to acts of depredation, so long as they held possession of Louisburg. The Acadian French, and the Indians, professed, by their deputies, submission to England, yet, as the former resolved to remain, as formerly, neutral, it was asserted that they could not be depended upon.

Their condition was a most difficult one, and circumstances would seem to warrant the charges against them. The Indians, soon after the defeat and destruction at Kennebec, plundered Canseau, attacked Dartmouth, opposite Halifax, scalped some of the inhabitants, murdered nearly half the crew of two

ships in Halifax harbour, and carried off several prisoners, whom they sold at Louisburg. They were incessantly committing murders along the coasts; and it was impossible to guard the colonists effectually against enemies, who sprung with the agility and fury of tigers from the thickets, or who came along silently in their birch canoes during night.

The Governor of Louisburg invariably replied that he had no control over the savages, and that the premiums given for English prisoners were paid from feelings of humanity, to prevent the horrible tortures and death which the savages would inflict.

Dartmouth was again surprised by the Mic-macs, who scalped many, made prisoners of the majority of the inhabitants, plundered the houses, and escaped, by the Shubenacady lakes, to the Bay of Fundy. The settlement of Lunenburg, at Malagash, formed by a colony of industrious Germans, was about the same time harassed, and several of the inhabitants murdered, by the Indians.

Many of the Acadian neutrals, who were settled at Minas and Chignecto, had, it was alleged, not only sworn allegiance to France, but were preparing to join a force sent down from Canada, under M. la Corne, who had built forts at Minas and Bay de Vert.

A small detachment, under Major Lawrence, was therefore despatched from Halifax to Chignecto, by Lord Cornwallis. The inhabitants, on hearing that he was approaching; and, dreading that the massacre of Kennebec would be followed up by one fully as exterminating, they burnt their houses, and joined La Corne. After an unsatisfactory interview with that officer, Major Lawrence returned to Halifax. He was soon after sent to Chignecto, with a force of 1000 men, and effected a landing, under sharp skirmishing, and the loss of several men. The French and Indians escaped across the river, and again joined La Corne. Lawrence then built a fort, to overawe the French, and to check the incursions of the Indians. The French, at the same time, erected several additional forts.

In 1754, an expedition from New England, under the command of Colonel Monkton, proceeded to Chignecto, where he was joined by four ships of war and a detachment of regular troops. After bombarding and taking a light-house and battery, Fort Beau Sejour, which mounted twenty-six pieces of artillery, was stormed, and the garrison made prisoners. The fort on Bay Vert was also invested and taken.

Major Lawrence, then governor of Nova Scotia, determined to transport the Acadians, unless they subscribed to the oath of allegiance in the fullest manner. Their conduct at Chignecto he considered indefensible, although they always declared that they were forced to join La Corne, or else lose their lands, which he claimed as within the limits of Canada. They never had taken the oath of allegiance, and could not therefore be treated as rebels. They expressed all humility, and begged to be allowed to remove to Canada, or to Cape

Breton, if they were to be sent from Nova Scotia, which they loved, and in which they were happy. On the latter condition, they offered willingly to swear allegiance to His Britannic Majesty, if they were exempted from bearing arms against their countrymen and the Indians.

It was urged, on the other hand, that to remove them either to Canada or to Cape Breton, would be adding great colonial strength to the enemies of Britain; and to allow them to remain in possession of their lands, situated in the most fertile part of the province, and commanding the easiest route for the French and Indians to enter Nova Scotia, would be equally dangerous. The puritanical spirit of the English colonists, which distrusted the neutrality of catholics, even under the sanction of an oath, consummated the difficulty of their position.

Without any intimation as to the object, they were commanded to appear before Colonel Winslow, at Grand Prè; and, in consequence, about 400 Acadians obeyed the summons. These unfortunate men were shut up in their church, which was turned into a prison, and they were told that their lands and herds were confiscated, and that the Acadians and their families should all be, immediately, transported from the province, to the southern British colonies.

For many years after the first French adventurers resorted to Nova Scotia, the cultivation of the soil was neglected for hunting, fishing, and the fur-trade. The rich *intervales*, or alluvial meadows, and the extensive salt marshes, which abound within the basins of Minas and Chignecto, with the fertile lands of Port Royal, and Annapolis River, at length riveted the industry of the simple-mannered Acadians, to grazing and husbandry, and secured to them all that was necessary to render their condition equally remote from poverty or wealth. With their habits, customs, and education, in the medium state, between barbarism and refinement, their condition, if left undisturbed, probably embraced as much happiness as human nature can enjoy. They became affectionately attached to the country; and they formed among themselves a cheerful virtuous peasantry; who, when Nova Scotia was finally ceded, in 1710, to the crown of England, had, by regularity of conduct, and steady industry, attained to sufficiently affluent circumstances; so far, at least, as possession of extensively-cultivated farms, and large herds of cattle might constitute riches.

In giving an account of the Acadians of that period, we shall extract the beautiful, and, we believe, just picture of their condition, drawn by the celebrated Abbé Raynal.

“Such was the attachment which the French then had for the honour of their country, that the Acadians,” says the abbé, “who, in submitting to a new yoke, had sworn never to bear arms against their former standards, were called French-neutrals.

“No magistrate was ever appointed to rule over them, and they were never acquainted with the laws of England. No rents, or taxes, of any kind were ever

exacted from them. Their new sovereign seemed to have forgotten them, and they were equally strangers to him.

“Hunting, which had formerly been the delight of the colony, and might still have supplied it with subsistence, had no further attraction for a simple and quiet people, and it gave way to agriculture. It had been begun in the salt marshes and lowlands, by repelling, with dikes, the sea and rivers which overflowed those plains. Those soils, at first, yielded fifty times as much as before, and afterwards twenty times as much at least. Wheat and oats succeeded best in them, but they likewise produced rye, barley, and maize. Potatoes were also grown, in great plenty, the use of which was become common.

“At the same time they had immense meadows, with numerous flocks. Sixty thousand head of horned cattle were computed on them; and most of the families had several horses, though the tillage was carried on by oxen.

“The habitations, built chiefly of wood, were extremely convenient, and furnished as neatly as a substantial farmer’s house in Europe. The people bred poultry of all kinds, which made a variety in their food, and which was, in general, wholesome and plentiful. Their common drink was beer and cider, with which they sometimes mixed some rum.

“Their usual clothing was, in general, the produce of their own flax and hemp, or the fleeces of their own sheep; with these they made common linens and coarse cloths. If any of them had any inclination for articles of greater luxury, they procured them from Annapolis, or Louisburg, and they gave in exchange corn, cattle, or furs.

“The neutral French had no other articles to dispose of among their neighbours, and they made still fewer exchanges among themselves, because each family was able, and had been used, to provide for its wants. They therefore knew nothing of paper currency, which was so common throughout the rest of North America. Even the small quantity of specie which had flown into the colony did not enter into circulation, which is the only advantage that can be derived from it.

“Their manners were, of course, extremely simple. There never was a cause, either civil, or criminal, of importance enough to be carried before the Court of Judicature established at Annapolis. Whatever little differences arose from time to time among them were amicably adjusted by their elders. All their public acts were drawn by their pastors, who had likewise the keeping of their wills, for which, and their religious services, the inhabitants voluntarily gave them a twenty-seventh part of their harvests.

“These were plentiful enough to support more than a sufficiency for every act of liberality. Real misery was entirely unknown, and benevolence prevented the demands of poverty. Every misfortune was relieved before it was felt, and good was universally dispensed without ostentation on the part of the giver, and with-

out humiliating the person who received. These people were, in a word, a society of brethren, every individual of which was equally ready to give, and to receive, what he thought the common right of mankind.

"So perfect a harmony naturally prevented all those connections of gallantry which are so often fatal to the peace of families. There never was an instance in this society of an unlawful commerce between the two sexes. This evil was prevented by early marriages; for no one passed his youth in a state of celibacy. As soon as a young man came to the proper age, the community built him a house, ploughed the lands about it, sowed them, and supplied him with all the necessaries of life for a twelvemonth. Here he received the partner whom he had chosen, and who brought him her portion of her father's flocks. This family grew up and prospered like the others. They altogether amounted to 18,000 souls."

The abbé continues to observe:—

"Who will not be affected with the innocent manners, and the tranquillity of this fortunate colony? Who will not wish for the duration of its happiness? Who will not construct, in imagination, an impenetrable wall, that may separate these colonies from their unjust and turbulent neighbours? The calamities of the people have no period; but on the contrary, the end of their felicity is always at hand."

These apprehensions of the Abbé Raynal were but too fully realised.

The Acadians were accused of having joined the troops from Canada; but those who did so, pleaded being forced to join their countrymen; and certainly a great share of their misfortunes must be laid to the charge of the French at Canada and Cape Breton. It must also be remembered that their accusers were their judges, and they were visited by punishment, the severity of which can scarcely be defended, had they been even guilty of the most capital crimes.

Exclusive of the unsettled and adventurous French, there were at this time about 20,000 stationary Acadians living on their farms, which comprised some of the most fertile lands of the province; they possessed upwards of 60,000 head of horned cattle, 70,000 sheep, 50,000 hogs, besides horses.

Many of them fled to the woods, and joined the Indians; others found their way to Canada, and to the Island of St. John, now Prince Edward's. The settlements at Chignecto and Minas were subjected to conflagration; and all their villages and farms laid waste, and their churches and houses reduced to ashes.*

* The following fragment, translated loosely by a gentleman in Nova Scotia, was written by M. de Chatelain, one of the sufferers of 1755. The original French manuscript is in the library of the "Hotel Dieu," Quebec.

THE TEARS OF ACADIA.

And must we from our native land depart?
Break, break asunder, oh my bleeding heart!
Driven from our altars, and our happy home—
Strangers and poor—through other realms to roam.
Our wives and infants share the direful fate—
Unspotted victims of tyrannic hate.

The wretched inhabitants, deprived of food and shelter, were obliged to surrender, or fly to the woods, in order finally to escape to Canada, the Island of St. John, or Cape Breton. Some found their way to, and established themselves in, Hayti and in Louisiana. From 7000 to 8000 surrendered, at discretion; and Colonel Winslow, in sending them away from a country to which they were so much attached, acted with far more kindness and delicacy than his orders strictly allowed. Their sufferings in the southern colonies, to which they were transported, were cruel and undeserved: they experienced the treatment not of prisoners of war, but of condemned convicts. Several families finally found their way to France, where they arrived utterly destitute; and were, under the auspices of a worthy man, M. de Pérusse, established at Cenon, in the arrondissement of Châtellerault (Vienne). But the place, or other circumstances, appears to have been unsuitable to them: many of them returned to America. Some, however, remained; and four or five heads of families, descended from them, are still living at Cenon.

The ardent attachment which the Acadians cherished for Nova Scotia, during their exile in the southern British settlements, is forcibly and feelingly expressed by them, in the language of the following petition to his Majesty George III.

This memorial, after stating their conscientious scruples as to the oath required of them concludes:—

“Thus we, our ancient parents and grand-parents (men of great integrity and approved fidelity to your Majesty,) and our innocent wives and children, became the unhappy victims to those groundless fears; we were transported into the English colonies, and this was done in so much haste, and with so little regard to our necessities and the tenderest ties of nature, that, from the most social enjoyments and affluent circumstances, many found themselves destitute of the necessities of life; parents were separated from children, and husbands from wives,

See them on bended knees, with tears o'erflowed,
In our calamities lament their own;
Sever'd from father, brother, son, and friend,
Unheard of sorrows shall their steps attend.
Yet some sad trembling hope still flutters near,
That we shall meet again, though never here;
Meet to divide the mis'ries of our chain,
But never to enjoy a smile again!

* * * *

Our flocks shall follow strangers—now no choice,
Though still unknown to them the stranger voice.
Our faithful dogs may trace these *ruins* round,
And mourn the masters never to be found.
Oh never shall we tread the peaceful plain,
Where our brave fathers toil'd for us in vain!
Oh, never shall we see Acadia's shore—
Ours once, by Heaven's decree, but ours no more.
Our churches burn—behold the ascending glare,
Bearing to Heaven our agonizing prayer!
Eternal Judge, to whom revenge belongs,
Forbear to visit for our num'rous wrongs;
Let us impatience bow beneath the rod,
And say with Christ, “Thy will be done, oh God!”

some of whom have not, to this day, met again; and we were so crowded in the transport vessels that we had not room even for all our bodies to lay down at once, and consequently were prevented from carrying with us proper necessities, especially for the support and comfort of the aged and weak, many of whom quickly ended their misery with their lives; and even those amongst us who had suffered deeply from your Majesty's enemies, on account of their attachment to your Majesty's government, were equally involved in the common calamity of which René Leblanc, the notary-public before-mentioned, is a remarkable instance; he was seized, confined, and brought away among the rest of the people, and his family, consisting of 20 children, and about 150 grand-children, were scattered in different colonies, so that he was put on shore at New York, with only his wife and two youngest children, in an infirm state of health, from whence he joined three more of his children at Philadelphia, where he died without any more notice being taken of him than of us, notwithstanding his many years' labour and deep sufferings for your Majesty's service.

"The miseries we have since endured are scarce sufficiently to be expressed, being reduced, for a livelihood, to toil and hard labour, in a southern clime, so disagreeable to our constitutions, that most of us have been prevented by sickness from procuring the necessary subsistence for our families, and are, therefore, threatened with that, which we esteem the greatest aggravation of all our sufferings, even of having our children forced from us, and bound out to strangers, and exposed to contagious distempers unknown in our native country.

"This, compared with the affluence and ease we enjoyed, shows our condition to be extremely wretched. We have already seen, in this province of Pennsylvania, 250 of our people, which is more than half the number that were landed here, perish through misery and various diseases. In this great distress and misery, we have, under God, none but your Majesty to look to with hopes of relief and redress. We thereby hereby implore your gracious protection, and request you may be pleased to let the justice of our complaints be truly and impartially inquired into, and that your Majesty would please to grant us such relief as in your justice and clemency you will think our case requires, and we shall hold ourselves bound to pray, &c."

This petition was, like many others, heartlessly disregarded by George III., who, unfortunately for the interests of England, never entertained any other idea but that of passive obedience from the colonists. The Acadians were allowed to pine, and many of them to die, in the southern colonies. Those who were afterwards allowed to return, settled where they best could, as the lands they previously possessed were confiscated and occupied by others. The Acadians descended from them are now to be found in various parts of Nova Scotia, New Brunswick, Prince Edward Island, Cape Breton, and the district of Gaspè, always living together in distinct villages. They love to cluster round their parish chapel, and not to live further from it than within hearing of its bell. They continue averse

to settle among other people, and we have not been able to discover more than five or six instances of their intermarrying with strangers. They profess and observe the most devoted adherence to the forms of the Romish church. On Sunday we observe a decorum, and simplicity, in the appearance of the Acadians, men, women, and children, that remind us of what history relates of primitive ages. They delight to assemble on that day, after the church service is over; and on week-days, after the hours of labour, to talk with, and to please each other. Sunday, with them, is a day of amusement and delight, as well as of devotion. Their general character is virtuous, honest, and inoffensive. Religiously tenacious of the *costume*, and all the habits and manners of their forefathers, they have no ambition to rise, in the world, above the condition in which they have lived since their ancestors first became a pastoral, and agricultural, people in Acadia. The dread of being exposed to the derision of their neighbours, for attempting to imitate the English inhabitants, and the want of an education that raises the mind above prejudice, are the principal causes that prevent individuals among them, who would willingly alter their dress and habits, from doing so.

In Nova Scotia, Prince Edward Island, Richibucto, and the Magdalene Islands, the Acadian women dress nearly in the same way as the peasantry near Dieppe, with neat calico caps, and sometimes a *coiffe*, or handkerchiefs tied over the head. Their petticoats of woollen stuff are liberally formed as to breadth, striped red, white, and blue, thickly plaited in large folds at the waists, but they seldom reach within six inches of the ankle: they usually wear blue stockings. On Sunday their linen and clothes are clean and neat, and they wear over their shoulders a small blue cloth cloak, reaching only half way down the body, and generally fastened at the breast with a brass broach. On week days, they are more carelessly dressed, and they usually wear *sabots*, or wooden shoes. The men dress in round blue jackets, with straight collars, and metal buttons set close together; blue or scarlet waistcoats, and blue trousers, and sometimes the *bonnet rouge*, or *gris*, but generally round hats.

At Arichat, in Cape Breton, both men and women sometimes depart in their costume from the fashions of the Acadians, and wear coats and gowns made in the modern fashion.

At the Bay de Chaleur one observes also a partial deviation from their usual dress, some of the men wearing long coats, and a few of the women with gowns, instead of the jerkin and petticoat. The head-dress of the females on the south side of the Bay de Chaleur seems peculiar to themselves. Instead of the smaller caps worn by the other Acadians, they delight in immense muslin caps in shape like a balloon, but not in the form of the *Norman cauchoise*.

The Acadian women are always industrious, and in the cod-fishing settlements, like their ancestors at the fishing-ports of Normandy, Piccardy, and Brittany, they

are perfect drudges. The men, after splitting the fish, leave the whole labour of curing to the women, who have also to cook, nurse their children, plant their gardens, gather what little corn they raise, and spin and weave coarse cloth. The old worn clothes they either cut into small strips, and weave into coarse bed-covers, or they untwist the threads into wool, which they again spin and make into cloth.

The occupations of the Acadians depend much upon their local situation. At Arichat, the Magdalene Islands, Rustico, Tracadie, the Bay de Chaleur, and some other places, where they principally follow fishing, they are not in such easy circumstances as at Clare, Cumberland, and in some villages in Prince Edward Island, where they chiefly depend on agriculture. Wherever we discover the Acadians depending on the cultivation of their lands, we find them nearly approaching the condition of their ancestors, as described by Raynal.* They marry very young, five to thirty couple at one time in the same chapel, are very affectionate to their children, and the husband seldom makes a bargain or enters on any project without first consulting "*sa femme.*" Domestic virtue they may lay an eminent claim to. One instance in a thousand cannot probably be discovered of a child being born out of wedlock. They have large families, and their children, when young, are fat and chubby, but few are so when they grow up.

The Acadians are nearly destitute of education; scarcely any of the women, and few of the men, can read or write; and, like all ignorant people, it matters not of what religion, they are exceedingly bigoted and superstitious.

Most of the men understand English, but a French dialect is, and will long continue to be, their language. It is far more corrupted than that spoken by the Canadians; but they perfectly understand French as spoken in France. Dancing, fiddling, and feasting at Christmas and on Mardi-gras, before Lent, and feasting at or after Easter, are among their amusements or indulgences.

* Along the south side of St. Mary's Bay, extending nearly thirty miles towards Yarmouth, lies Clare, which contains a population of about 4500 Acadians, the descendants of those neutrals who were formerly banished from the province, but when allowed, returned to the country dear to their hearts from early affection. While in exile, they often visited Nova Scotia in small shallops, which they built at Massachusetts; and on being permitted, after repeated applications for leave to return, they immediately removed to this part of the country, where they have settled and prospered. They certainly occupy a fine portion of the province, the lands of which are fertile, and on the shores of which the sea throws up abundant manures to enrich it when necessary. Fish also swarm round the shores: and, although the Acadians principally depend upon agriculture; they are also fishermen occasionally, and carry the overplus produce of the soil and fishing, across the Bay of Fundy to sell at St. John's. All their wants are easily supplied; and happy, contented, unambitious, retaining the habits and customs, language and religion, of their fathers, they seem to have nothing to wish for, and probably enjoy as much happiness as human nature admits.

The main post road leading from Annapolis to Yarmouth, passes through Clare. There are two chapels, one not far from each extremity of this long settlement. The easternmost, which is the largest, will contain about 2500 persons; its altar is a very splendid one. Here lives, and here has resided for thirty years, a man whom the revolution drove from France. In that country he was born, and there did he receive that education, and acquire those manners, which by being superinduced on a pure heart and sound head, constitute the worth of the amiable and venerable Abbé Segoigne. This excellent curé is the priest, the comforter, the lawyer, and judge of all the Acadians of Clare and Tusket. As their lawyer, or rather notary, he keeps their

CHAPTER XIII.

FRENCH SETTLEMENTS IN THE WEST INDIES.

AFTER the tragical end of Henry IV., Raynal observes that France was incessantly disordered by the caprices of an intriguing queen; by the vexatious measures of a greedy foreigner; and by the projects of a favourite, who possessed none of the abilities of an able statesman. A despotic ministry had enchained the energies of the country, at the time when a few bold navigators, excited by the spirit of independence, or by avarice, directed their views towards the Antilles, with the hope chiefly of interrupting Spanish vessels among those islands. After taking several prizes, they sought for a place to careen, and repair their vessels, in the Island of St. Christopher. The chief of those Corsairs, Denambuc, had authority from the French government to form not only a settlement at St. Christopher, but wherever he pleased or could, on any of the Antilles. The government which granted this simple permission, but without any aid or supplies of any kind, exacted a twentieth part of all the produce of the colonies which might be formed under that authority.

A company was formed in 1626 to establish colonies, under a patent, or charter, from the crown of France. The property of all, or any, of the Antilles, which this company should colonise, was vested in its shareholders: for which

records, writes their deeds, notes, and contracts; while his opinion as their judge, and his advice as their priest and father, convince his flock of the evils of litigation, from which they are taught to fly as from a pestilence. Woe be to the lawyers of Nova Scotia, if each settlement in the province had an Abbé Segoigne for its pastor, and inhabitants that respected his advice.

Since M. Segoigne retired to this peaceable and secluded settlement, he has only been once at Halifax, and only two or three times at the adjoining town of Digby. The urbanity of manner, and the polish which distinguished the gentleman of the old French school, are truly those of the abbé; yet, for him, the world has no allurement to fascinate his thoughts from the calm, pious, cheerful, and useful life, which has diffused so much happiness among the Acadians.

All the changes, politics, and vexations of the world, are unknown to him; and he has, probably, no further connection out of Clare and Tusket with his own church, than an occasional letter from the Catholic bishop of Quebec and Halifax. He speaks the Indian language fluently; and the Micmacs regard him with the utmost veneration. The greater part of his flock have been born, or have grown up under him, while he has been among them; and a few are accompanying him in the decline of his well-spent life. To him, with reverence and love, all look up for comfort in their afflictions, for advice in their mutual difficulties, and for the settlement of their little disputes.

One of those tremendous fires, which makes such fearful ravages in America, nearly destroyed the district of Clare, in 1823. The chapel, and most of the houses and corn-fields, were consumed; and M. Segoigne had one of his hands severely burnt, while pushing through the fire to save the boxes which contained the land titles and other records of the inhabitants. This calamity was inevitably the cause of much distress and poverty, which the Acadians have long since completely overcome.

The Acadian settlers at Tusket, about 200 families, are an orderly people, in tolerably good circumstances. They have a neat chapel, amidst a beautiful grove of oak trees, in which the Abbé Segoigne officiates occasionally.—*Mac Gregor's British America*, 2d edition, vol. i., page 356-7-8.

grant the company were bound to pay one hundred pounds of tobacco, or fifty pounds of cotton for each settler between the ages of sixteen and sixty years. The company had the exclusive right of trading to and from those islands. "Unfortunately," says Raynal, "this association did that which monopolists always will do; the lust for excessive gain rendered it unjust and cruel." The Dutch, observing the tyranny of the French company towards the colonists settled at St. Christopher, offered the latter provisions, and merchandise, at moderate prices. A contraband intercourse was opened between them, which, from the first, it was found impossible to prevent. This trade and the policy of the government, which prevented the sale of any article the produce of the French islands, except in France, reduced the companies to the extremity of selling their possessions, in order to avoid total ruin.

In 1649, an individual named Boisseret purchased for 63,000 livres the whole of Guadaloupe, Marigalante, and some minor isles, together with the effects of the company in those islands. In 1650, another individual purchased for 60,000 livres, Martinique, St. Lucia, Grenada, and the little Grenadas. Seven years afterwards, he sold to the Count de Cerillac the two latter for a third more than he paid for the whole. The islands of St. Christopher, St. Martin, St. Bartholomew, St. Croix, and Tortola, were sold to a person named Malthe for 100,000 livres, which were paid by De Poincy the governor of the French Antilles.

These proprietors, although the church claimed the Antilles as fiefs of the crown, received the rights of feudal lords. They re-sold, in subdivisions, their lands, and conferred all the civil and military appointments. Although under these petty sovereigns, the cultivation of the French Antilles was extended, their actual prosperity was retarded by restrictions; and the profits expected to be derived from trade were, as under the company, absorbed by the Dutch smugglers. Colbert attempted to remedy the evil by the fallacies of premiums and protection.

He repurchased Guadaloupe and its dependencies for 125,000 livres; Martinique for 40,000; Grenada for 100,000; and all the possessions purchased by Malthe for 500,000 livres. Re-investing the sovereignty and property of these islands in the crown, would have been wise, if the lands were afterwards, without special privileges, sold or let to individuals. Colbert, dazzled by the delusive grandeur of establishing a great company, incorporated, under the monopoly of a royal charter, the whole agriculture and commerce of the French settlements in the Antilles, in Guyana, in North America, and in Africa.

This was the Royal French Company of the Indies, established, with extraordinary immunities and privileges. Money was advanced to this association without interest for four years. All imports and exports, in the trade between France and their possessions, were to pay no duty. The most brilliant success was promised by the minister and expected by France. By the company's mis-

management, exclusive monopoly, the frauds of agents, the competition of the Dutch and English smugglers, the loss of ships and their cargoes during war, and the consequent disappointments, in France, and in the Colonies, caused a complete derangement of the affairs of this ill-conceived association. In 1674, the French government, very prodigally, assumed the debts of the company, amounting to no less than 3,523,000 livres; reimbursed the capital of 1,287,185 livres; and, a second time, re-possessioned the sovereignty, and proprietorship of the French Colonies.

In 1643, the merchants of Rouen sent one Poncet de Bretigny to form a settlement on the island of Cayenne, in Guyana. His ferocious conduct towards the colonists and the natives caused a revolt, and he was killed. A second attempt to settle in Guyana was made in 1651, by a new association. The excellent Abbé de Marivault, who was to take charge of the colonists, was drowned in the Seine, on embarking for the ship which was to have carried him across the Atlantic. Roiville, a Norman gentleman, who was appointed to replace the abbé, was murdered on the outward voyage. Twelve of the principal assassins arrived at Guyana; where they soon quarrelled; hung one of their number, sent three to perish on a desert island, and the remainder committed horrible atrocities and abominations. The commandant of the citadel deserted, with part of his troops, and joined the Dutch. Many died of hunger; and several were killed by the natives. In less than fifteen months after landing, 500 to 600 perished in various ways; and the few who survived, abandoned the fort, the arms, and stores, and arrived at the Windward islands, in a small ship and two canoes.

The Dutch formed a small settlement on the same island, after the departure of the French.

In 1663, a new company was formed, under the direction of M. de la Barre, master of requests; and the government aided him so far as to enable him to expel the Dutch from Cayenne. The place was taken by the English four years afterwards; and again, in 1771, by the Dutch: after which, it was restored, and remained undisturbed, but in a state scarcely above the semblance of a colony, until some *flibustiers*, or buccaneers, arrived with the treasures which they had plundered from the Spaniards. With the riches which they had acquired by robbery and piracy, they resolved to begin cultivating Guyana. But in 1688, a mariner, of the name of Ducasse, who commanded some armed vessels, proposed to the *flibustiers*, who settled at Guyana, to aid him in pillaging Dutch Surinam. With the prospect of plunder, their former spirit revived. They re-assumed the life of Corsairs; and they drew off with them most of the previously-settled colonists.

The attack on Surinam was repelled. One division of the Corsair force perished in making the assault; and the others were made prisoners, and sent to

the Antilles. Cayenne still continued to exist as a French colony. The culture of rocou was first commenced; and before the year 1722, cotton, indigo, and sugar-canes were cultivated. In 1752, the population consisted of 86 French families, 125 Indians, and 1500 negro slaves. The exports of its produce that year, is stated to have amounted to 80,363 lbs. of sugar; 26,881 lbs. of coffee; 91,916 lbs. of cacao; 260,541 lbs. of rocou; 26,881 lbs. of cotton; 618 feet of wood, and 104 deals. In 1763, France having lost Canada and Cape Breton, the government directed its views towards Guyana, for which 12,000 colonists sailed, without any preparation having been made previously for their reception. They were landed on a most unhealthy part of the continent, without habitations to lodge in; and without any knowledge of the soil, climate, or the country. More than 10,000 were carried off by the diseases brought on by exposure to the climate, and the numerous privations incident to their situation. The remainder wandered over, and settled in, different parts of that low region: they were suddenly destroyed by an inundation. This calamity was the consequence of their ignorance of such a phenomenon overflowing the country periodically. All the 12,000 colonists, on whose success great hopes were entertained in France, perished miserably, without leaving behind them a trace of their existence. France was, at this period, fully oppressed by those arbitrary financial exactions, and by those despotic and corrupt measures on the part of the court, the nobility, and the church, which constituted the preparative causes of the most terrible, though, probably, the most inevitable, of revolutions.

Cayenne, and five other unimportant places, were still inhabited by some French colonists; but the whole population, in the year 1772, did not exceed 1300 Europeans, and 9000 negro-slaves. Their live stock consisted of nearly 2000 horned cattle, and about 1000 other domestic animals; and its productions were even less than at a former period.

The French, in 1650, began the planting of St. Lucia, which was neglected by England, and by all other powers. About forty colonists were conducted to this small island that year by a sagacious man of the name of Rousselan, who had married a Carrib woman. Through her influence and his own discretion, he lived in peace with that ferocious race until his death, four years afterwards. His three successors, one after the other, quarrelled with, and were massacred by, the Carribs; and the settlement continued to decline until 1664, when it was captured by the English, who abandoned it in two years afterwards, as unworthy of colonisation. The French then returned to it; but no great progress was ever made by them in planting or settlement; and the right to its possession was asserted by England as well as by France. In 1731, both nations agreed to evacuate St. Lucia, reserving to the subjects of either to resort to it for wood and water. From this period it became a lucrative point of intercourse for the contraband adventurers of different nations, until 1763, when England gave up

its pretensions to France. The French minister, of that time, resolved to colonise St. Lucia without delay. Seven to eight hundred men were embarked, at a heavy expense, and landed on the island, where they became the victims of a nearly similar calamity, to that which caused the destruction of those who perished at Surinam. Wiser measures were afterwards adopted by Count d'Ennery, the practical founder of the colony. The vessels of all nations were then allowed to trade to it, with perfect freedom; roads were constructed; and in 1772, the population amounted to 2018 Europeans, 663 free blacks, and 12,795 negro slaves. The live stock on the island consisted of 928 horses and mules, 2070 horned cattle, and 3184 goats and sheep. There were thirty-eight sugar mills. The produce of agriculture was chiefly sugar, coffee, cacao, and cotton.

In 1736, Martinique was so far advanced in its cultivation, that it possessed 447 sugar estates, besides several coffee, cacao, rocou, tobacco, and cotton plantations; 4,806,142 banana trees; and several plantations of manioc, potatoes, &c., for food; all cultivated by 72,000 negro-slaves, of all ages and sexes. The exports were valued at 16,000,000 of livres, about 660,000*l.* sterling. About 200 vessels arrived annually at Martinique from France; fourteen to fifteen with slaves from Guinea; thirty from Cape Breton and Canada, with provisions and fish; besides the vessels which arrived from Trinidad, Marguerite, and the English and Dutch smugglers.

The prosperity of the island was arrested by the war of 1774. The port of its capital, St. Pierre, became an arsenal, chiefly for equipping privateers, or rather corsairs, who, to the number of about forty, fought actions and made prizes, which rendered their exploits as famous as those of the old *flibustiers*. While they brought plunder into St. Pierre, the adventurers became rich; but the regular trade and navigation with France, Canada, and Cape Breton, was interrupted, and nearly destroyed; the contraband trade with the Spanish colonies ceased; the sugar and coffee plantations were, in consequence, and from the great riches first brought in by the privateers, neglected; sugar-mills and machinery were allowed to decay; the produce of food soon became inadequate to the consumption of the inhabitants; and many of the slaves are said to have died from want of nourishment. The consequent ruin was not easily repaired. The profitable contraband trade with the Spanish colonies was found to have been, during the war, transferred to new adventurers. A vicious system of commerce and navigation was, on the re-establishment of peace, instituted by the French ministry. In 1755, only four vessels arrived at Martinique from Quebec. The colonial administration of France was placed under the direction of corrupt and unscrupulous persons, who sold places, emoluments, and monopolies.

In a few years, however, although the agricultural prosperity of Martinique was in a ruinous state, the trade of the port of St. Pierre reassumed considerable activity; especially the trade in Africans, brought there for sale chiefly to be

transhipped to Guadaloupe and the neutral islands. It became also a port for the sale of merchandise to, and purchase from, contrabandists. War again interrupted all this commerce, and Martinique was conquered by the English, who re-ceded it to France at the peace of 1763. St. Vincent, St. Dominic, and Grenada, remained, however, in the possession of England. Guadaloupe was still possessed by France; but the intercourse between it and Martinique was most unwisely prohibited by the government.

In 1769 the importation into France from Martinique, by 102 ships, consisted of 177,116 quintals of white sugar; 12,579 quintals of brown raw sugar; 68,518 quintals of coffee; 11,731 quintals of cacao; 6048 quintals of cotton; 2518 quintals of cassia; 783 barrels of taffia; 307 barrels of syrop; 150 lbs of indigo; 2147 lbs of confitures; 47 lbs of cacao paste; 282 lbs of rasped tobacco; 294 lbs. of rolled tobacco; 3273 lbs of anniseed; 234 cases of *liqueurs*; 346 jars of refined syrops; 451 quintals of dye-woods; 12,108 skins: total value, only 12,265,862 livres. The value of imports from France, part of which only was consumed in Martinique, amounted to 13,449,436 livres.

The sugar plantations declined to 286, in which 116 mills were worked by water, 12 by wind, and 184 by oxen. The population in 1770 consisted of only 12,450 whites of all ages and sexes; of 1814 free coloured; and 70,553 negro slaves. War, and the corrupt, and unsound, administration of the colonial direction, in France, were alone the causes which retarded the prosperity of this naturally rich and valuable possession.

GUADALOUPE was neglected by all Europeans until 1635, when two Frenchmen, named Duplessis and Loline, arrived at this island with 550 colonists. Neither prudence nor common wisdom appear to have been considered in making their preparations. They were unprovided with proper food, and soon after their arrival, they found that they were unable to procure provisions. They, in consequence, resolved, most iniquitously, to plunder the natives, whom they attacked for the purpose, without success. The Carribs, not considering themselves able to defeat the French openly, destroyed the provisions which were demanded, levelled or burnt their habitations, and retreated to the fastnesses of Guadaloupe, or to the neighbouring islands. Famine among the French was the consequence. The living devoured the dead, and nearly the whole of the colonists perished. The few who survived were found and relieved, afterwards, by settlers from St. Christopher. Peace was also established with the Carribs; the cultivation of Guadaloupe was then commenced; a fresh number of adventurers resorted to the island soon afterwards; and its prosperity seemed established; when its progress was suddenly retarded by disorders among the colonists, and by a preference which was consequently given to Martinique.

In 1700, sixty years after its settlement, the whole population of Guadaloupe consisted of only 3825 whites; 325 free Carribs and coloured people; 6725

Carrib and negro slaves. It had only 60 small sugar plantations, 66 indigo gardens, and some insignificant spots planted with cotton and cacao. Its live stock comprised only 3700 horned cattle, and 1620 sheep and goats.

In 1755, the population increased to 9643 whites and to 41,140 slaves of all ages and sexes. It had 334 sugar plantations: some indigo gardens; with plantations of cotton, coffee, cacao, rice, maize, bannanas, manioc, &c. Its live stock consisted, in 1759, when conquered by the English, of 4946 horses; 2942 mules; 13,716 horned cattle; 1162 sheep and goats, and 2444 hogs. It was re-ceded to France in 1763. During the period in which it was held by the English, they carried into Guadaloupe 18,721 negro slaves, and they proportionably increased its cultivation. In 1767 the population of this island consisted of 11,863 whites, 752 free coloured, and 72,761 slaves. Its live stock comprised 5060 horses; 4965 mules; 17,178 horned cattle; 14,895 sheep and goats; 2669 hogs. It cultivated for food 30,476,218 *fosses* of manioc, and 2,819,262 bannanas. It had 21,474 *carreaux* planted with sugar canes; 5,881,176 square feet under coffee; 12,156,769 feet with cotton, besides some small plantations of cacao, rocou, &c. The sugar mills were, 140 worked by water, 263 by oxen, and 11 by wind. Its exports to France, in 1768, only amounted to 140,418 quintals of white sugar; 23,603 of brown; 24,205 of coffee; 11,955 of cotton; 456 of cacao; 1886 of ginger; 2529 of dye-woods; 24 cases of confitures; 165 cases of liqueurs; 35 kegs of taffier, and 1202 skins. An extensive contraband was carried on at this period.

The island of St. Bartholomew was resorted to in 1648 by about fifty Frenchmen, who settled on it, but who were massacred by the Carribs in 1656. Before 1757 a few French resorted to, and resettled in, this poor island, which the Swedes became possessed of afterwards. The French, in 1648, established themselves in Mariegalante, by acts of violence towards the inhabitants.

HAYTI, or St. Domingo, was possessed solely by Spain; from the period of its discovery and the extermination of its aborigines, until the French invaded a part of its territory. In 1630 the small island of *La Tortue*, two leagues from the northern shores of Hayti, was captured by some French and English adventurers, who fled from the island of St. Christopher. *La Tortue* is about twenty miles long and about five broad, inaccessible on the north, but with a good roadstead on the south side. It soon attracted a number of adventurers, many of them the most desperate characters. Some, who were men of moderate pretensions, began cultivating tobacco, which was reputed for its good quality. Others resorted to hunt cattle at St. Domingo, for their skins, which they sold to the Dutch. But the bold and desperate became *flibustiers*, or corsairs, whose daring intrepidity and exploits became famous in the West Indian seas. They are generally called buccaneers by the English; but the buccaneers, from the term *boucan*, smoked or hung beef, was the name given to the cattle hunters by the French. The court of Madrid became

alarmed at the position taken up by the occupants of La Tortue, and of a part of Hayti, and a General Galions was ordered to dislodge them. He chose for the purpose a time when the boldest and most numerous of the men were absent hunting cattle, or roving on the seas ; and he hung, or put to the sword indiscriminately, all whom he found in the settlements. He left those places without a garrison, believing that the promptitude with which he put the inhabitants to death would prevent any further attempt at occupation. He deceived himself and his government. The corsairs and hunters returned : they agreed to sacrifice to their common safety all jealousies, and elected a bold Englishman, named Willis, as their chief. They fortified the island, and attracted a great number of English sailors, and others, to this rendezvous for the bold and desperate. Such has often been the origin of monarchies : companions, in exile, in piracies and robberies ; in war or peace ; in good or bad fortune, have elected their captain, who soon became their master, and founded a power extending over a territory and its inhabitants. The island of La Tortue was too small a field for a monarchy, and the French governor of the Windward Islands captured it. It was taken, and lost, three times afterwards, by the Spaniards ; and in 1659 it remained in the possession of France, who made it the then avowed post for invading Hayti, which they afterwards continued to call St. Domingo.

For this enterprise, the French government, in 1665, employed Bertrand Dogeron, a man who had previously distinguished himself in the Marine, and afterwards at Hayti, and at La Tortue ; where he became its governor, or rather the chief of the buccaneers, or hunters, and of the *flibustiers*, or corsairs ; and of the few cultivators of the soil of that island, and of some places on the opposite shore. There was not, at the time he went to La Tortue, a woman on the island, nor among the French, who had planted themselves about the same time at Hayti ; and in the absence of females, the wild state of its society may be imagined, but it is not to be represented. Dogeron was convinced that no colony,—no society could prosper,—that no morals could be established, without the introduction of wives, among the lawless people, over whom he was deputed to rule. He consulted with them, and represented the evil. They requested him to send to France for virtuous women to become their wives ; he demanded the full number from the government. Fifty only were sent ; and in order to prevent an effusion of blood among the impetuous spirits, in competing for them, he found it necessary to let the highest bidder, at public auction, have a wife by purchase. Fifty others arrived soon after, and were taken as wives in like manner. But the course adopted, when all the remaining colonists demanded wives from France, was the most immoral and disgraceful that a minister could have conceived. It may not have been inconsistent with the code of morals which prevailed at the time in France ; but it shocked even the wild corsairs of La Tortue and Hayti. The minister directed that a sufficient number of the prostitutes

of Paris and some other places, should be collected and sent to Hayti ; where, for three years after their arrival, they were directed to be hired to those Frenchmen who wanted wives, in La Tortue and Hayti. The minister excused himself by saying, his object was to purge Paris. If this had been true, which no one will believe, how could he justify that mode of purification by the pollution he sent to the colony? The infection conveyed by this act of immorality, was disastrous. Many of the boldest colonists at Hayti were carried off. It transplanted there an immorality of character, that was not eradicated during the whole period of its possession by France.

Dogeron struggled against the effects of the evil, and he succeeded so far as to increase the number of cultivators of the soil, from 400 to 1500; when in 1670, the Royal Company of the Indies monopolised its trade, and prohibited the introduction of merchandize by others. The monopolists sold their goods at a price two-thirds higher than that for which they had been obtained from the Dutch. The colonists resisted the imposition by armed force, until they obtained the privilege for all French vessels to trade with them, on condition of paying the company five per cent. upon the value of imports and exports. Dogeron managed this arrangement with great ability and with perfect disinterestedness. The colony continued to prosper under this excellent man, who was on no occasion known to do any thing by which he could promote his pecuniary interest, until death carried him off in 1675. He governed the colony wisely, though he had neither troops nor the authority of laws. His nephew, who succeeded him, followed his example, though he did not inherit his abilities. After the death of the latter, a similar system of administration, and police, as that of Martinique, was established in Hayti. The tribunal at Cape François was instituted in 1702. Trade and the sales of produce were restricted by monopoly. The hides which were obtained by hunting cattle, were purchased only at a limited and unprofitable price. Tobacco, which had been previously cultivated with profit, was subject to the monopoly of being farmed. Its cultivation was consequently limited. The colonists then directed their attention to other means of acquiring wealth. They attacked the Spanish settlements, and carried off slaves to cultivate the grounds, which had previously been cultivated by the wages-paid labourers, brought from France. The sugar cane was introduced and cultivated ; but the monopoly of the Royal Company of St. Louis, or of the Indies, paralysed all enterprise, except that of the slave and contraband trade, until the company itself was finally ruined by its corrupt agents, and by its unsound principles of trade. In 1720, the government re-assumed the trade and administration of Hayti, then usually called St. Domingo. Many who had spent under the broiling sun of that climate from twenty to thirty years of their lives, had transmitted the proceeds of their labours and savings to France, in order to maintain them for

the remainder of their lives; but they received in payment only the notorious *billets de banque* created by the Mississippi scheme, and their ruin, with that of their families, was the consequence.

The exclusive trade of supplying slaves was given to the agents of the Company of the Indies. Resistance in Hayti baffled this monopoly, and the colony, after suffering greatly by a bad administration, began afterwards to prosper, and its cultivation increased rapidly. It extended along eighty leagues of the north, west, and south coast of Hayti. The town of Cape François, founded by a Calvinist, named Gobin, soon increased and flourished.

In 1754, the produce of French Hayti was sold on the spot to the value, for exportation, of 28,832,851 livres. The imports from France were valued at 50,628,780 livres, or more than two millions sterling.

In 1764, the white inhabitants able to carry arms, amounted to 8786, and the free-coloured, and freed negroes able to carry arms, to 4114. The number of slaves amounted to 206,000. In 1767, the exports to France amounted to 72,718,781 lbs. raw sugar; 51,562,013 lbs. brown sugar; 1,769,562 lbs. indigo; 150,000 lbs. of cacao; 12,197,977 lbs. of coffee; 2,965,920 lbs. of cotton; 8470 packs of raw hides; 10,350 tanned hides; 4108 barrels of taffia; and 21,194 barrels of syrop. These exports were carried to France in 347 vessels. To this trade we must add a contraband trade with their indolent Spanish neighbours. The cultivation of coffee extended rapidly, and it soon more than doubled in production. The slave trade augmented the number of slaves rapidly, while the free people increased but slowly in numbers. The sufferings of the former, and the generally unwise administration, caused finally the revolution in Hayti, which rendered it independent of France.

St. Croix was lost in 1696, and St. Christopher by the peace of Utrecht. During the war which followed the first revolution, England became possessed of all the French West Indies. Martinique, Guadaloupe, and French Guyana, were re-ceded to France at the peace of 1814. The colonial policy of France, after the suppression of the Company of the Indies, is instructive and curious. We shall hereafter describe it, briefly, in a general view of the colonial policy of Spain, Portugal, France, Holland, and England.

CHAPTER XIV.

FRENCH SETTLEMENTS AT NEWFOUNDLAND, CAPE BRETON, AND ST. JOHN'S ISLAND.

THE fisheries had, from an early period, attracted the French to the banks and coasts of Newfoundland, and they formed a settlement in Placentia Bay; but England never acknowledged any sovereign right over the soil to France, further than curing fish on certain parts of the coast; and by the treaty of Utrecht, Placentia, and every other place occupied by the French at Newfoundland, were ceded to Great Britain: France, however, retaining the right to come and fish on, and depart from the coast, during the fishing season.

CAPE BRETON.—It has been said that Cape Breton obtained its name from the first discoverers being natives of Britany, but this is not true, as it was first discovered by Cabot, and afterwards by Verazani, who named it *Ile du Cap*. The name of Cape Breton was at first given to its most easterly point, which projects into the sea between Louisburg and Scatari, and afterwards extended to the whole island. In 1713, it was called by the French *L'Ile Royale*; but it remained unplanted until 1714, when the French, from Newfoundland and Acadia, made some settlements on it near the shore, where each person built according to his fancy, as he found ground convenient for drying cod fish, and for small gardens.

In 1715, Louis XIV., after having been long contending with the united powers of Europe, made an offer to Queen Anne of part of the French possessions in North America, in order to detach Great Britain from that formidable alliance; and by the Treaty of Utrecht, ceded to England all claims to Newfoundland, Hudson Bay, and Acadia (Nova Scotia). France preserved Canada, and the islands of Cape Breton, and St. John (Prince Edward). Cape Breton had, before this time, been considered altogether unfit for making any settlement on. In summer time it was frequented by a few fishermen, and, during winter, the inhabitants of Acadia resorted thither for the purpose of trading for furs with the Indians.

But the French, with the view, partly, to repair the loss they sustained,—as it was considered by them of the utmost consequence not to be entirely driven out of the cod-fishing,—and, also, to maintain a post that would enable them to command the mouth of the river St. Lawrence, by which a communication was kept open with Canada, were induced to colonise Cape Breton, and to build the town, and fortify the harbour, of Louisburg.

The *Seneglay*, a French ship of war, commanded by M. de Contreville,

arrived at Louisburg on the 13th of August, 1713, and took possession of it, but it was not fortified until 1720. It was taken by the British forces from New England, in 1745, at which time they built a fort at Indian Bay, where they discovered coal, and opened a pit. The command of these forces, amounting to 4000, was given to William Pepperal,* a colonel of militia, but brought up to trade, and extensively engaged in commerce. His affability, and his general character, made him very popular among those volunteer troops.

There was something like the spirit of the crusades in this expedition. The famous Mr. Whitfield supplied them with the motto, "Nil desperandum, Christo duce," for their banner; and the military feeling of these forces was probably excited more by fanaticism than by any other motive.

Commodore Warren, after some delay, joined the transports from New England; and after a siege of forty-nine days, during which the provincials distinguished themselves by their endurance and bravery, Louisburg surrendered on the 18th of June. Commodore Warren, a few days before, captured the *Vigilant*, of 74 guns, commanded by the Marquis de la Maison Forte, with a great supply of stores; and some time after two French East India ships, and a South Sea ship, valued at 600,000*l.*, were decoyed into Louisburg, by hoisting the French flag in the usual place.

St. John's Island fell into the possession of England a little after; and the inhabitants were transported to France. Some English, on that occasion, ventured incautiously into the country, where they were surprised by the Indians, and twenty-eight were either massacred or made prisoners.

The stores, merchandise, fish, &c., taken at Louisburg, were of immense value; and the importance of this place to France, as a rendezvous for its West India fleets, and as the head-quarters of their fisheries, was of vast consequence. Privateers were also fitted out here to disturb the British fisheries, and to infest the British colonial coasts. The Micmac Indians resorted to it with the scalps of the English who became victims to their cruelty; and although the French considered them an independent people, they are accused of countenancing, even during peace, the aggressions of the savages on the English.

Cape Breton was restored to France by the Treaty of Aix-la-Chapelle, in return for Madras, and remained in possession of that power until the surrender of Louisburg, on the 26th of July, 1758, to the British forces under the command of General Amherst, and Brigadier-generals Lawrence and Wolfe, and the fleet commanded by Admiral Boscawen.

The French, commanded by M. de Drucourt, defended Louisburg, from the 8th of July, until its capitulation, with extraordinary bravery, against a powerful fleet, consisting of twenty-three ships of the line, eighteen frigates, with sloops of war, and transports, amounting to 157 ships, and against 16,000 land forces,

* Afterwards created a baronet.

On this occasion, Madame de Drucourt behaved with great heroism, appearing daily on the ramparts, animating the soldiers in the unceasing duty which the defence of the place demanded.

The merchants and the greater part of the inhabitants of Louisburg, were, after its capture, sent to France in English vessels. But the civil officers of government,—the military and naval officers, soldiers, marines, and sailors, in number 5720, were transported as prisoners-of-war to England. The stores and ammunition, besides 227 pieces of artillery, found in Louisburg, were of great value. The following description of the then metropolis of Cape Breton, was written by a gentleman who was residing in Louisburg during the siege. “The French began to fortify this town in 1720. It is built on the neck of land which juts out into the sea south-east of the island. It is of an oblong figure, and nearly a league in circumference. The streets are wide and regular; and near the principal fort and citadel there is a handsome parade. To the north of the town there are three gates, and a spacious quay. They have likewise constructed a kind of bridges, called in French *calles* (wharfs), which project considerably into the sea, and are extremely convenient for loading and unloading goods.”

“The fortifications consist of two bastions, called the King’s and Queen’s, and two demi-bastions, distinguished by the names of Dauphin and Princess. These two out-works are commanded by several eminences. The houses are almost all of wood; the stone ones have been built at the king’s expense, and are designed for the accommodation of the troops and officers. When the English were masters of the town, in 1745, they built very considerable *caserns* (barracks). The French transplanted the materials of their stone buildings, as well as their other works, from Europe.

“There is hardly a settlement that has been attended with more expense to the French nation than this of Louisburg. It is certain that they have laid out about thirty millions of livres; and so cogent were the motives which induced them to put this scheme into execution, that the preservation of Louisburg will always be considered as an object of too great importance not to sacrifice every thing to it. Cape Breton protects the whole French trade of North America, and is of equal consequence in regard to their commerce in the West Indies. If they had no settlement in this part of North America, their vessels, returning from St. Domingo or Martinique, would no longer be safe on the great bank of Newfoundland, particularly in time of war; lastly, as it is situated at the entrance of the Gulf of St. Lawrence, it absolutely commands the river of that name.

“The entrance of the harbour of Louisburg is defended by a battery, level with the surface of the water. It is planted opposite the light-house, on the other side of the Grande-terre, and consists of thirty-six pieces of cannon, all of them four-and-twenty pounders. The harbour is also defended by a cavalier

called by the name of Maurepas, which has twelve embrasures. The Royal Battery, situated at the distance of a quarter of a league from the town, is mounted with thirty pieces of cannon, twenty-eight of which are thirty-six pounders. It commands the sea, the town, and the bottom of the bay. The port of Louisburg is at least a league in length, and upwards of a quarter of a league in its smallest breadth. There is very good holding ground, and generally from six to ten fathoms water. They have a very safe and convenient place to careen their ships, where they may also be laid up in winter, only taking proper precautions against the ice."

The island battery not mentioned in the above description, commanding the harbour, mounted thirty guns, and some other batteries were planted before the siege. The town was surrounded, with the exception of about 200 yards of the sea, of most difficult access, by a broad stone rampart thirty feet high, and a wide ditch. An extensive marshy bog, in the rear, rendered the approach by land both difficult and dangerous.

The population of Louisburg at that time, exclusive of troops, was about 5000. The administration was lodged in the governor and supreme council. There was also a bailiwick, or court of law, and a court of admiralty. It had an hospital for invalid soldiers and sailors, "which was served by six brothers of the charitable fraternity, of whose conduct, as well as that of the Recollet Friars, and other spiritual directors in Cape Breton, complaints were frequently made by the French inhabitants, and by the English of Nova Scotia, who charged them with the direction of the atrocities committed by the Indians." The nuns of Louisburg called themselves of the Community of Quebec; their province was to superintend the education of young girls. There were two handsome churches in the town, one of which was within the citadel; and several other public buildings.

The British government, fearing that Louisburg might again fall into the power of the French, ordered the town and fortifications to be demolished; and it has ever since remained in ruins, notwithstanding its excellent harbour, and the extraordinary importance attached at the time to its conquest.

During the period that France held the colony, the inhabitants were chiefly engaged in fishing. In this trade were employed nearly 600 vessels, exclusive of boats, and between 27,000 and 28,000 seamen; and the French ministry considered this fishery a more valuable source of wealth and power to France than the possession of the mines of Mexico and Peru would be. The principal settlements at that time were within the Bras d'Or, at Port Dauphin (St. Ann's), Spanish Bay (now Sydney), Port Toulouse (St. Peter's), Arichat, Petit de Grat, and river inhabitants.

ST. JOHN'S ISLAND, NOW CALLED PRINCE EDWARD ISLAND.—The first land Cabot met with, after leaving Newfoundland, is said to have been this

island, on the 24th of June, 1497 (St. John's day), and that he called it St. John's Island. But the probability is, that the alleged discovery was some part of Newfoundland. The French, after the settlement of Canada, took possession of it, as within the limits of New France, and as having been discovered in 1523, by Verazani. It appears to have been granted, in 1663, by the Company of New France, together with the Magdalen, Bird and Brion Isles, to the Sieur Doublet, a captain in the French navy, to be held by him in vassalage of the Company of Misco: one of the minor associations of that period.

The Sieur's associates were two companies of fishing adventurers from the towns of Grenville and St. Maloes, who never made any permanent settlement on the island, except trifling fishing-posts at two or three places.

After the peace of Utrecht, many of the French, who lived in Acadia, came and settled on the island; and others flocked to it from Cape Breton, on finding they could have the advantage of a fertile soil, as well as the benefit of a plentiful fishery; but so great was the apprehension of the French government, that these great natural advantages would drain off the fishermen settled at the important harbour of Louisburg, that the inhabitants were prohibited from fishing, except at two or three harbours. Afterwards the French garrison at Louisburg received from this island grain, vegetables, and cattle; and two commissaries were stationed at different places for collecting and shipping the same.

From the observations of a French officer, who visited this island in 1752, we may have some idea of its condition before it was taken by the British forces. He says, "St John's is the largest of all the islands in the Gulf of St. Lawrence, and has the advantage of Cape Breton in point of fertility. It has safe harbours, plenty of wood, and as great a convenience for fishing as any place on the coast. It had been altogether neglected, as well as Cape Breton, until necessity having shown the French the utility of the latter, their eyes were also opened in regard to the former. They have since been at pains to plant it, though not enough, considering its advantageous situation. Though the Island of St. John is subject to no particular commandant, he receives his orders from the governor of Cape Breton, and administers justice conjointly with the sub-delegate of the intendant of New France. They reside at Port la Joye," (now Charlotte Town) "and the governor of Louisburg furnishes them with a garrison of sixty men.

"It was from this place we set out in the beginning of the month of August, 1752. We ascended the river to the north-east seven leagues, up to its very source, from whence we proceeded to the harbour of St. Peter's, after having made a carriage of four leagues across a plain, well cultivated and abounding in all sorts of grain." After remaining some days at St. Peter's, he visited the harbours of Fortune, De la Souris, and Matieu; "The neighbouring lands of which," he continues, "are exceeding good and proper for culture. We found several sorts of trees, with a prodigious number of foxes, martins, hares, partridges, &c. The rivers abound in

fish, and are bordered with pasture lands, which produce exceedingly good grass. The inhabitants came over here from Acadia, during the last war, and are about eight-and-forty in number. After coasting along, we doubled the east point, which we found deserted, because a fire had obliged the inhabitants to abandon it, in order to go and settle two leagues further upon the north side.

“ We continued our course six leagues, until we arrived at the Pool de Naufrage. The coast, though very level, presents the eye with nothing but a country laid waste by fire ; and further on it is covered with woods. We met with but one inhabitant, who told us the lands about the pool were exceedingly good and easy to cultivate, and that every thing grows there in great plenty. Of this he gave us a demonstration that afforded us a singular pleasure ; this was a small quantity of wheat he had sown that year, and indeed nothing could be more beautiful than the ears, which were longer and fuller than any I had seen in Europe.

“ This place took the name of Pool de Naufrage, from a French ship that had been cast away on the coast. The vessel was lost four leagues out at sea ; but a few passengers saved themselves upon the wreck, and were the first that settled at the harbour of St. Peter's. The coast swarms with all sorts of game, and with a variety of the very best fish.” This writer, after briefly describing places at that time settled, namely, Port la Joye, Pointe Prime, St. Peter's, Savage Harbour, Fortune, Souris, Matieu, Trois Rivières, Tracadie, Racico (Rustico), Malpec, (Richmond Bay), Cascampeec, Bedec, Rivières aux Blondes (Tryon), Rivières des Crapauds, and des Sables, further observes, “ The plantation of this island is of great consequence, as well in regard to the fishery, as to the commerce which the inhabitants may carry on in the interior parts ; but, to render it more solid and durable, they should attend to the more essential parts, namely, to agriculture, and pasturage for the breeding and maintaining of all sorts of cattle, and especially sheep ; by keeping them together in folds, the upper lands might be improved, and the meadows and corn-fields laid out ; from whence the inhabitants would reap a plentiful harvest of all kinds of grain. For if they had the proper means of making these improvements, their own lands would abundantly supply all their wants, and they would be beholden to foreigners for nothing but salt, lines, hooks, and other fishing-tackle. Here they have likewise a vast quantity of plaice, thorn-backs, mackerel, and herrings. In several pools and lakes along the downs, they have excellent trout, and such a prodigious quantity of eels, that three men might fill three hogsheads of them in four-and-twenty hours. Lastly, you meet in all parts of the island with great plenty of game. It is, therefore, surprising that so plentiful a country should have so long been overlooked by the French.”

From the foregoing extracts, it is probable that the French government would not have allowed the natural resources of this island to have remained dormant, if they had retained its sovereignty.

In 1758, this island surrendered to Great Britain, when its population is stated to have been 10,000, but an old Acadian, who was living in 1832, and was then on the island, told us that he recollected well the number of families in all the settlements, and that the population could not have exceeded 6000. It was stocked with above 10,000 head of black cattle, and some of the farmers raised 1200 bushels of corn each for the Quebec market. Lieutenant-Colonel Rollo was sent from Louisburg, by General Amherst, to take possession of the island; and, on its capture, the British commander asserted, that a vast number of English scalps were found hung up in the house of the French governor. The island, for many years preceding, was the principal resort of the Micmac Indians, and from the immense quantity of oyster shells on the banks of rivers and bays in the neighbourhood of oyster beds, where the savages generally pitched their wigwams or tents, we may conclude that it was their rendezvous for many centuries. In several places, these shells, which are partly in a pulverised state, cover several acres to the depth of from one to five or six feet.

The old Acadian French, driven from Nova Scotia, assimilated themselves at that time in a great measure to the habits of the Indians. Some of these Acadians were sent to Canada, others to the southern colonies.

At the peace of 1763, this colony and Cape Breton were annexed to the government of Nova Scotia; the progress of which we must include hereafter under that of the British possessions in America.

CHAPTER XV.

FRENCH DISCOVERIES AND SETTLEMENTS IN CANADA.

CANADA, from the time of its discovery by Cartier, was neglected, though visited by the French, until 1603, when Champlain, with Pontgrave, as the representatives of a company who had procured a charter for prosecuting discoveries, and establishing settlements on the river of Canada, sailed from Honfleur on the 15th of March, and arrived on the 24th of May at Tadousac: a harbour at the mouth of the Saghunny, to which the French fur traders had resorted in 1600 and 1601.

Champlain sailed up and explored the river St. Lawrence as far as the rapids of Lachine, above the island of Hochelaga, which he named Montreal. He then returned; explored several parts of the Gulf of St. Lawrence; and arrived safely in France. In the following year he was nearly shipwrecked on the north coast of Cape Breton, where he was compelled to winter in a harbour which, from its form, he called Port Justaucorps, now Port Hood.

The company by which Champlain was employed, and with which he was associated, directed its views exclusively to the gains made by the fur trade. All the other purposes of their charter were neglected,—but Champlain inherited from nature a mind which would not confine its enterprise to the mere collection of peltry, and to his bold spirit and judgment are due the merit and honour of founding Quebec and of the settlement of Canada.

On the 13th of July, 1608, he laid the foundation of the capital of Canada on a bold promontory, which forms a natural citadel, on the north side of and commanding the St. Lawrence, where its breadth is less than a mile, the water deep, and with a port more than sufficiently capacious for all the fleets of Europe. The choice of this situation confers immortal honour on his judgment. He erected, the first year, a fort, and habitations for the few settlers whom he brought with him from France. His judgment, afterwards, in selecting Montreal as a place of settlement, and an emporium for the trade of the interior country, is another proof of his foresight. He is not, however, entitled to praise for wisdom in his policy towards the Aborigines.

At that period, the Algonquins, who inhabited the adjacent country, and the Montagnez (mountaineers), who occupied the hilly grounds, and the banks of the Saghunny, together with the Hurons of the upper country, were in alliance, as the common enemy of the powerful Iroquois nation.*

Champlain, by joining those tribes in their wars against the Iroquois, committed a fatal error, which exposed the French settlements, in Canada, to all the calamities of savage warfare for nearly 100 years; and the introduction of fire-

The Abbé Raynal observes—"The character of the North Americans was singularly developed in the war between the Iroquois and Algonquins. These two tribes, the most numerous of Canada, had formed among themselves a kind of alliance. The former tilled the ground, and divided with their neighbours its produce, whilst the latter hunted, and also divided their spoil. In the severe frosts, when the ground could not be cultivated, they lived together: the Algonquins hunted, and the Iroquois contented themselves with drying the meat and dressing the skins.

"A party of Algonquins one year came home unsuccessful from the hunt. The Iroquois who followed them asked permission to try whether they had better luck; this was refused them. Such a refusal they could not submit to. They departed at night, and returned after a very successful hunt. The confusion and shame of the Algonquins was great. To efface even the remembrance of it, they murdered in cold blood the Iroquois hunters. The Iroquois swore to be avenged, or to perish in the attempt. But not being experienced enough to attack their adversaries, they resolved to make war with their less powerful neighbours, until 'they should have learned to come as the fox, to attack as the lion, and to fly as the bird;' that then they would not fear to revenge the murder of their kindred.

"About this time the French appeared. The Montagnez, who inhabited the mouth of the river St. Lawrence; the Algonquins, who occupied its shores, from Quebec to Montreal; the Hurons, settled round the lake of the same name, and several other less important and wandering tribes, encouraged the settlement of these foreigners.

"In alliance with each other against the Iroquois, without being able to resist them, these several nations saw in the French a valuable ally, with whom they promised themselves infallible success. They were not mistaken. Champlain, who ought to have profited by the greater foresight of the Europeans over the Americans, to seek some means to pacify them, did not even attempt a reconciliation; attaching themselves eagerly to the interests of their neighbours, they proceeded with them against the enemy."

arms, first among the Algonquins, and afterwards among the other Indian nations, was turned to the most terrible account, for more than a century, against the European settlements.

Champlain explored the Ottawa, and many other parts of the country; and then returned to France, where he succeeded in forming, under the patronage of the Prince of Condé, who assumed the title of Viceroy of New France, a new association at Rouen. He returned to Canada in 1612, taking with him four Recollets, for the purpose of converting the savages. The war with the Iroquois seems principally to occupy the next eight years; and in 1620, Champlain brought his family to Canada. The Prince of Condé surrendered his viceroyalty this year to the Marshal de Montmorency, who continued Champlain as his lieutenant.

Two years after, the Duke de Ventadour, having entered into holy orders, took charge, as viceroy, of the affairs of New France, solely with the view of converting the savages, and for this purpose he sent some Jesuits to Canada, to the great mortification of the Recollets.

A number of Calvinists, associated with their leader, the Sieur de Caen, were at this period actively engaged in the fur trade; and the jealousies and bickerings maintained between them and the catholics, arising in reality from the spirit of trade, but attributed, as usual, to religious scruples, greatly retarded the prosperity of the French settlements.

The Cardinal de Richelieu endeavoured to put an end to these causes of disension, by establishing the Company of New France. This company, consisting of 100 associates, engaged to send 300 tradesmen to Canada, and to supply all those whom they settled in the country with lodging, food, clothing, and implements, for three years: after which period they would allow each workman sufficient land to support him, with the grain necessary for seed. The company also engaged to have 6000 French inhabitants settled in the countries included in their charter before the year 1643, and to establish three priests in each settlement. The priests were also to be provided with every article necessary for their personal comfort, as well as the expenses attending their ministerial labours, for fifteen years; after which cleared lands were to be granted by the company to the clergy, for maintaining the catholic church in New France.

The prerogatives which the king reserved to himself, were the supremacy in matters of faith; homage as sovereign of the country, with the acknowledgment of a crown of gold, weighing eight marks, on each succession to the throne; the nomination of all commanders and officers of forts; and the appointment of the officers of justice, whenever it became necessary to establish courts of law.

The royal charter then granted to the company and their successors for ever, in consideration of their engagements to the crown, the fort and settlements of

Quebec, all the territory of New France, including Florida, with all the countries along the course of the great river of Canada, and all the other rivers which discharge themselves thereinto, or which, throughout those vast regions, empty themselves into the sea, both on the eastern and western coasts of the continent, with all the harbours, islands, mines, and rights of fishery.

The company was further empowered to confer titles of distinction, which, however, required, in the erection of marquisates, earldoms, baronies, and counties, the confirmation of the sovereign, on the recommendation of the Cardinal de Richelieu, superintendent-in-chief of the navigation and commerce of New France. The exclusive right of traffic in peltries, and all other commerce, for fifteen years, with the exception of the right to fish for cod and whales, was also granted to the company.

Two ships of war were presented to the company by the king, the value of which was to be refunded, if the company failed in sending at least 1500 French inhabitants, of both sexes, to New France during the first ten years.

The descendants of Frenchmen, inhabiting Canada, and savages who should be converted to the catholic faith, were also to be reputed as natural-born Frenchmen, and to enjoy the same privileges; and all artificers, who were sent by the company to their American territories, and who spent six years there, were permitted, if so inclined, to return to their native country, and to establish themselves in any trading-town in France.

Such were the principal immunities and provisions of this celebrated charter: it was signed in April, 1627, and created the greatest and most flattering expectations. The administration under a viceroy being omitted, the company continued M. Champlain as Governor of Canada; but untoward circumstances, particularly the capture of the first ships, sent from France with stores, by Sir David Kirke, reduced the colony to great distress. He even appeared with his squadron before Quebec; and might easily, had he known the famished condition of the garrison, have compelled it to surrender. The prosperity of Canada was not only retarded, by the folly or corruption of the company's directors in France, but even the powerful mind of Champlain, so fertile in expedients on occasions of difficulty, was subjected to the most vexatious mortifications by orders and restrictions, and by various unfortunate circumstances in the colony.

The hostilities of the savages were not the least of the evils that perplexed him; and the Iroquois soon perceived the advantages which the continued jealousies and quarrels, between the catholics and Huguenots, enabled them to obtain over men whom they considered unwarrantable occupiers of their country.

In 1629, at a period when Champlain was reduced to the utmost extremity, by the want of every article of food, clothing, implements, or ammunition, and

exposed to the incessant attacks of the Iroquois, Sir David Kirke, commanding an English squadron, appeared again before Quebec. The deplorable situation of the colony, and the very honourable terms of capitulation proposed by him, induced Champlain to surrender the fortress of Quebec, with all Canada, to the crown of England. Kirke's generosity to the colonists induced them to remain; but in 1632, three years afterwards, Canada, with Acadia, was restored, by the treaty of St. Germain's, to France.

In the following year, Champlain, who was very properly re-appointed governor, sailed with a squadron, carrying all necessary supplies to Canada, where he found, on his arrival, most of his former colonists.

The affairs of New France now assumed a more prosperous aspect; and measures were adopted for maintaining all practicable harmony among the inhabitants, and preventing, as far as possible, those religious disturbances which previously convulsed the colony. The company was taught by former experience that their indiscriminate acceptance of all who presented themselves as adventurers, ready to embark for New France, constituted the leading cause of disorderly conduct and unsteady habits among the colonists.

In 1635, the Marquis de Gamache, who had some years before joined the society of Jesuits, became the commander of their order in Canada. Their services in preserving order and inculcating morality among the colonists, their extraordinary perseverance in making discoveries and establishing missions—the regulations of their great college, founded in 1635, by Father Reni Robault, and the *fiefs* which they obtained, form such important subjects in the early history of North America, that we must appropriate a separate chapter hereafter to the discoveries and establishments of the Jesuits in Canada.

The death of Champlain, which happened this year, was a grievous misfortune to Canada. In establishing and maintaining the colony, he surmounted difficulties that few men would have courage to encounter, and under which thousands of men, with minds even above the common standard, would have succumbed. The splendour of his views, which enabled him to perceive, and the soundness of his judgment, which led him to conclude, that a region possessing such advantages as Canada must, in the probable course of events, become a great empire, stimulated and supported him in prosecuting, with undaunted perseverance, the vast undertaking in which he engaged. During the greater part of his active life, the sole object of his heart was to become the founder of a colony, which he felt confident would eventually attain extraordinary power and grandeur. His anticipations have, since that period, been realised beyond those of most men who have spent their lives, like him, in great undertakings.

After his death, however, although the governor, M. de Montmagny, entered into the views of his predecessor, yet, wanting the experience, the scientific and

professional abilities, and probably the same confidence from the inhabitants, the improvement of the colony languished, and the fur trade alone seems to have been followed with any spirit.

The ardent spirit of enthusiasm, which went forth during that age, to accomplish the conversion of the Aborigines of America, led to the establishment of religious institutions in Canada; and although these establishments did little for the immediate improvement of the colony, yet, as points of possession occupied by persons whose avocations were professedly holy and useful, they formed the foundation, on which arose the superstructure of those morals and habits that still, and will long, characterise the Gallo-Canadians. In 1636, a little after the college of the Jesuits was commenced, an institution for instructing the Indians was established at Sillery, a few miles above Quebec; and two years after, the Duchesse d'Aiguillon, under whose patronage the Hôtel Dieu was founded by a Madame de Bouillon in 1644, sent three nuns from Dieppe to superintend its services. About the same time, Madame de la Peltrie, a young widow of rank, engaged several sisters of the Ursulines at Tours, with whom, with a vessel hired at her own expense, she sailed from Dieppe for Quebec, where she arrived after a tedious passage, and founded the convent of St. Ursula. The order of St. Sulpicius, instituted by the Abbé Olivier, sent a mission this year to Canada, and a situation was chosen at Montreal for a seminary, which was consecrated with great ceremony and solemnity by the superior of the Jesuits, and for the maintenance of which the whole island of Montreal was granted by the king. The College of St. Sulpicius was founded in 1650 by the Abbé Quélus, and two years afterwards Madame de Youville, a young widow, founded the Gray Sisters.

The Company of New France, who fulfilled none of the stipulations of their charter, and who also found means to prevent the complaints of the inhabitants being heard, or listened to, by the ministers of the crown, did nothing towards settling or cultivating the country; and the forts which they erected at Richelieu, and other places, were merely posts of defence, or storehouses for carrying on the fur trade. The characters of those employed in the service of the company were stamped with infamy, and they were described as generally licentious; from among those men arose the race of vagabonds, known since that period by the name of *Coueurs du Bois*. Under such management Canada languished for several years; while the Iroquois, with more experience in war, continued to harass the colony with unabated ferocity.

The settlement at Montreal, which was very much exposed to the ravages of the Iroquois, suffered severely, and its extinction was only prevented by the arrival of M. d'Aillebout, in 1647, from France, with a reinforcement of 100 men. Marguerite Bourgeois, who accompanied him, founded at the same time the institution of the Daughters of the Congregation, or *Sœurs Noires*, at Montreal.

In 1658, the Marquis d'Argenson arrived in Canada with the commission of governor-general; and in the following summer, Laval, Abbé de Montigny, and titular Bishop of Petrie, landed at Quebec with a brief from the pope, constituting him apostolic vicar. Curacies were at the same time established in Canada. The condition of the colony at this period appears, however, to have been truly wretched. Its defence and support were completely neglected by the Company of New France; the associates of which, reduced to forty in number, at last gave up even the fur trade, for the seignorial acknowledgment of 1000 beaver skins. The Iroquois, who had spread terrible destruction among their old enemies, the Hurons and Algonquins, seemed also determined at this time to exterminate the French; and several hundred of their warriors kept Quebec in a state little short of actual siege, while another band massacred a great number of the settlers at Montreal.

The governor, who complained of ill-health, requested his recall, and, in 1661, he was relieved by the Baron d'Avangour, an officer of great integrity and resolution, but considered too inflexible for the situation he held. His decisive measures appear, however, to have saved Canada; the defenceless state of which, and the natural beauty and importance of the country, he stated in such forcible language to the king, who was previously ignorant of its value or condition, that he immediately ordered 400 troops, with necessary supplies, to Canada, accompanied by a special commission. Their arrival gave life and confidence to the colonists, who were then, for the first time, enabled to cultivate the soil with any security.

A tremendous earthquake, which appears to have agitated the whole of Canada and a vast extent of the adjacent countries, in the year 1663, is described by the French writers of that time, as accompanied by the most violent phenomena, rendered more than usually terrific by the continuation of the shocks, at intervals, for nearly six months. On the evening of the 5th of February, a loud rumbling noise, seemingly occasioned by atmospheric detonation, was heard throughout the whole of those regions. The terrified inhabitants, having never heard of an earthquake in the country, at first conceived their houses on fire, and immediately flew out of doors; and their astonishment was then increased by the violent agitation of the earth, and every thing on its surface. The walls shook, the bells of the churches rang, and the doors flew open and closed again of themselves. The forest trees were seen all in violent motion, some thrown up from the roots, others with their tops bending nearly to the ground, first to one side, then to the other, or laid prostrate on the surface, from which again they were flung up in the air.

The ice, which covered the lakes and rivers, in many places some feet thick, was broken open, and frequently thrown, with rocks and mud from the bottom, a great distance upwards. Clouds of dust obscured the sky. The waters were impregnated with sulphur, exhibiting yellow or reddish colours. From Tadousac

to Quebec, about 130 miles, the St. Lawrence appeared white and thickly impregnated with sulphureous matter.

The convulsion of elements produced the most awful and incessant sounds, roaring at one time like the sea, then reverberating like the rolling of thunder; and again as if mountains were bursting, and the rocks which composed them cracking and rolling over each other. The darkness was rendered still more awful by the frequent flashes of lightning, or by the lamentations of women, the cries of children, and the howling of dogs and other animals.

Walruses and porpoises were said to have been seen as far up the St. Lawrence as Three Rivers, where they never appeared before; equally terrified with the inhabitants of the land, and the former howling in the piteous manner so peculiar to them.

The first shock continued without intermission for about half an hour. It was followed, about eight o'clock, by a second equally violent. Thirty shocks were numbered during the night, and the whole country continued to be violently agitated, at intervals, until the end of July. Such is the description written by the Jesuits.

From all the accounts transmitted to us, it appears wonderful that no human lives were lost during this extraordinary convulsion; nor does it appear that any change was caused in the configuration of the countries said to be so long and violently disturbed by the power of its action. The river St. Lawrence and its tributaries, the Saghunny, the islands, Quebec, Lakes St. Peter and Champlain, Montreal and the rapids of St. Louis, or La Chine, are apparently at this day exactly in the same position as when discovered by Cartier and Champlain.

CHAPTER XVI.

COMPANY OF NEW FRANCE SURRENDER THEIR CHARTER.

THE Company of New France, who had from the first mismanaged the affairs of Canada, and who even lost the vast profits which might have been realised from its trade, by neglecting, from ill-timed avarice, to provide for the exigencies of the colony, at length surrendered their charter to the king. Its powers and immunities were transferred, in 1664, to the Company of the West Indies: from one ill-directed incapable association to another.

The administration of the colony, without an effective government, or courts of justice, was wretchedly managed after the death of Champlain. The governor, the Jesuits, and the bishop, appear to have been equally anxious to supplant each other in power. The Baron d'Avangour, just in his views, but at the same

time inflexible in his decisions, was recalled at his own request, and M. de Mesey, who was recommended by the bishop, succeeded him as the first governor under the Company of the West Indies. This officer quarrelled soon after with the bishop, who, with many good qualities, appears to have been a very arbitrary ecclesiastic. A council, composed of the governor-general, intendant-general, the bishop, and some others, removeable at the will of the governor, was established about this time, in which, as a court of justice, presided the superior of the Jesuits as Grand Seneschal of New France, to decide matters of dispute.

The complaints of the bishop and others against M. de Mesey, the governor, induced M. Colbert to recall him ; and the Marquis de Tracy, who had been for some time before Viceroy of America, arrived in Canada from the West Indies, in June, 1665, with some companies of the regiment of Carignan, the remainder of which, with their colonel, M. de Sallierres, arrived soon after from France. Three forts were then erected on the river Richelieu, by which the Iroquois descended on their expeditions against the French. The first was built where the old one stood (now William Henry), and M. de Sorel, who was left there as commandant, superintended its structure, and transmitted his name not only to the fort but to the river. The second was erected by M. de Chambly, at a place still bearing his name ; and a third further up by M. de Sallierres, which he named St. Thérèse. These garrisons kept the Iroquois for some time in awe, but they soon recommenced their depredations, with greater fury than ever, by other routes, and it required all the vigilance of M. de Tracy to preserve the settlements from destruction.

Before this officer returned to France, he placed the country in a state of defence, which enabled it for some time to enjoy peace ; and having established the Company of the West Indies in all the rights possessed by the Company of New France, he left M. de Courcelles governor-general, with several officers of great abilities under his command.

From this period (1668) we find the affairs of Canada so far prosperous, that little apprehension was entertained as to the colony being established on a permanent foundation ; although the ferocity of the natives left no grounds for expecting a cessation of hostilities for any definite period. Several of the officers, who received grants of land about this time, with the rights of seigneurs, settled with their families in Canada ; and many of the private soldiers whom they commanded were also distributed among the other colonists, who were all equally ready to take up arms, whenever the incursions of the savages rendered it necessary to defend the country. The French government, at the same time, sent 300 young women of loose character to Canada, who, in less than fifteen days after their arrival, were all disposed of in marriage among the inhabitants, on which occasion considerable presents were made to the latter, as part of the con-

dition of making chaste wives of females who had been reared in, and transported from, the pollution of Paris. They certainly did not improve the morals of Canada: yet the care which was afterwards bestowed by the religious orders, in bringing up the succeeding generations, has long effaced all traces of any unchaste origin. To all parents who had ten children, lawfully begotten, pensions were also given.

In 1670, the church of Quebec was constituted a bishopric. The mission of Lorette, near Quebec, was established about the same time; some important measures were also adopted for the better government of the country, and for maintaining peace with the savages; and while the trade and agriculture of the colony were prospering during this interval of peace, the clerical orders became more enthusiastic than ever in their efforts to make proselytes of the Indians.

The fur trade, however, was in a great measure intercepted by a fatal calamity, previously unknown to the inhabitants of the western world. The small-pox, more terrible to the savages than all the fire-arms of Europe, made its appearance this year among the tribes north of the St. Lawrence, and its ravages carried off more than half their number. This contagion, and the use of ardent spirits, have, probably, since that time, destroyed a greater portion of the Aborigines of North America than war and all the diseases to which they were previously subjected.

Fort Frontenac was built in 1672, where Kingston now stands, for the purpose of awing the Indians, by Louis de Baude, Count de Frontenac, for whom, however, the right of ground was obtained with great adroitness by his predecessor, M. de Courcelles: a man of great personal worth and practical abilities, but neither gifted with the splendid talents, nor blemished with the unyielding obstinacy, of his successor.

M. de Frontenac was by birth of distinguished family, and a lieutenant-general of high reputation in the royal army. His brilliant talents were sometimes obscured by prejudices; but his plans for the aggrandisement of Canada were splendid and just; and if his great views had not been thwarted by the jealousy of his enemies, his measures would certainly have soon placed Canada in a condition that would have prevented the depredations of the Indians, and ensured its rapid settlement and cultivation. He possessed, however, a spirit which could not bear contradiction in the prosecution of his plans, either from the ecclesiastical orders, or from officers of whatever distinction in the colony. He was opposed in his measures, first by the clergy, and soon after by the intendant-general. Violent dissensions arose between them; and M. de Frontenac was not a man inclined to execute his plans with indecision, or by withdrawing the orders he had previously given. The intendant-general, M. de Chezneau, having neglected some orders, was imprisoned; the procureur-general was exiled; the governor of Montreal was put under arrest; and the Abbé de Salignac Fénélon, at

that time in Canada superintending the seminary of St. Sulpicius at Montreal, was imprisoned under pretence of having preached against M. de Frontenac, and having defended the governor of Montreal. The principal point of disagreement, between M. de Frontenac and the bishop, arose from a circumstance of very great importance, respecting which the former bishop had quarrelled with the Baron d'Avangour. This was the traffic in brandy, in exchange for furs with the savages. This spirit was the most fatal article that Europeans ever introduced among the Aborigines of America. It produced evils among the Indians of the most deplorable description. It superinduced, on their natural habits and disposition, the most degrading of European vices, which enervated their constitutions and destroyed all that dignified their original character. The bishop at last succeeded in obtaining an ordinance of the king, enjoining M. de Frontenac to prohibit the sale of spirits to the Indians, under the most severe penalties. This was considered as a victory obtained by the ecclesiastics over M. de Frontenac, who, however, notwithstanding the opposition to his government, had powerful friends at court, and retained his office as governor-general until 1682, when he and M. de Chezneau were recalled together.

During the administration of M. de Frontenac and his predecessor, M. de Courcelles, the French explored the greater part of Canada; and the savages were taught to regard the colonists with some degree of awe. M. Perrot, an indefatigable traveller, visited all the nations in the vicinity of the Great Lakes; who shortly afterwards sent deputies to meet the sub-delegate, of the intendant of New France, at the falls of St. Mary; where they finally agreed that he should possess and occupy that post in the name of his sovereign; and a cross was there erected, on which were placed the arms of France.

A tribe of the Hurons, who were converted and guided by Father Marquette, were soon after established at Makilimakinak; and the Iroquois, who were converted, and who separated from the rest of their nation, were settled about the same time on the south-side of the St. Lawrence, at the falls of St. Louis, near Montreal.

CHAPTER XVII.

THE JESUITS OF CANADA.—DISCOVERY OF THE MISSISSIPPI.

THE Jesuits, who were at first only missionaries, accompanying the early adventures, became afterwards, by royal patent, holders of lands in Canada, and other parts of New France. Their estates were acquired by grants from the king, or by gifts from individuals, and by purchase. The Jesuits afforded almost the

only means of instruction which the country formerly possessed. To the conversion of the savages, and to the education of youth, did these extraordinary men direct their labours with the most arduous zeal; and the course of instruction they taught was eminently practical. They did not attend funerals or visit the sick; these duties they left to the priests. But in their grand attempts to correct and civilise the Aborigines, they fearlessly endured the most extreme privations, and encountered the most formidable difficulties. Their ardour in the pursuit of discoveries and to make converts, led them undauntedly into the wildest regions, and along and beyond the Great Lakes. The priests were formerly the second in importance to the Jesuits. They never went beyond teaching their flocks the ceremonials and service of the church. Their influence and example, which were unfavourable to mental acquirements, were, however, beneficial in respect to morals. The *Recollets*, who made vows of eternal poverty, were the lowest religious order.

The first property in land, possessed by the Jesuits in Canada, was the seigniory of *Notre Dames des Anges*, near Beauport and Quebec, and granted by deed, 1626, by the Duke de Ventadour. The edict of the King of France having revoked all deeds previous to the charter of the Company of New France, this seigniory was by the company granted anew to the Jesuits; and, on the company surrendering their charter to the crown, a fresh deed was granted, in 1652, of the seigniory *en Franc aleu*, with the usual feudal rights.

It continued to be the property of the order until 1800, when, with the other property of the Jesuits, it was taken possession of by the British crown, on the death of Jean Joseph Cazot, the last of the order in Canada. It contained 28,000 square arpents.

The fief of Pachigny, at Three Rivers, containing only 585 arpents, was granted to them in *Franc Almoigne*, by deed, in 1736, from the company of New France, and secured by subsequent deeds.

They next acquired, in 1639, by deed from James de la Ferté, abbot of Ste. Mary Madeline, of Chateaudun, and canon of the King's Chapel at Paris, the valuable and fertile seigniory of Batiscan, above Three Rivers, containing about 282,000 arpents.

The seigniory of La Priairé de la Madeline, opposite Montreal, was granted, by deed, to the Jesuits in 1647, by M. de Lauzon.

The *Cap de la Madeline seigniory*, on the river St. Maurice, was granted in 1650, by the abbot La Ferté, as an irrevocable gift, in like manner as he granted Batiscan. It contained 280,000 arpents of land. Isle St. Christopher, as the mouth of the seigniory, belonged to the same estate, by grant of the governor, in 1657. It contained 60 arpents of poor land.

The seigniory of St. Gabriel was acquired in 1677, by deed from the seigneur, Robert Giffard, and Mary Renouard, his wife. It is near Quebec, and con-

tained about 180,000 arpents of land, of various degrees of fertility and barrenness.

The beautiful seigniory of Sillery, near Quebec, was first granted by the company of New France, in 1651, to the Jesuits, and afterwards *en Franc alev*, by M. De Callieres, in 1699. It contained nearly 900 arpents.

The seigniory of Belair, or *Montagne Bonhomme*, containing 14,000 arpents, was acquired, by purchase, from the heirs of the original seigneur, William Bonhomme.

The fief of *St. Nicholas de Lauzon* contained about 1200 arpents of excellent land. Several lesser grants, in the cities of Montreal and Quebec, of valuable property, belonging to the order of Jesuits; and the whole contained an area of not less than 778,000 arpents. The motives for which these estates were granted, are stated in the different grants to be the love of God; the great expenses which the order sustained in supporting missions; the extraordinary fatigues and hazards to which the Jesuits exposed themselves among the savages; the instruction of the Indians; pious foundations, and the general purposes of "*civil and religious*" education in New France.

The strong quadrangular building at Quebec, now used as barracks, was formerly the college of the Jesuits. When occupied by them, it was the most spacious building in America.* It is three stories high; along each of these there was a long gallery, on each side of which were the private cells of the fathers. It contained a large public hall, in which seats were placed along the walls; and before the seats were the dining tables. They never allowed women to reside among them. They were either fathers or brothers; the latter were novices preparing for admission to the order. When the fathers dined, the brothers carried the dishes from the outer halls to the tables, for common servants were never admitted into the dining hall; nor were the brothers ever permitted to dine with the fathers. At dinner, the fathers all sat down with their backs to the walls; and, in a pulpit opposite, one of them read aloud from some book during the repast; when strangers were invited, this observance was omitted, and animated conversation on general subjects, but seldom on religious matters, prevailed at the table.

In this building there were also several public halls and rooms, a laboratory, refectory, &c., and an extensive orchard and kitchen garden were attached. The British government converted this magnificent edifice into barracks, for which purpose it has long been used. It was from this palace that the various directions conceived by the Jesuit missions issued. It was by these men that measures were conceived for establishing a power on the banks and tributaries of the St. Lawrence, fully as great as that which was established in Paraguay.

They planned settlements, and established missions, on the most secure and

* Founded in 1635, by Père Reni Rohault. It will, it is said, lodge 2000 troops.

fertile grounds of the Saghunny river,—at the *Rivière des Trois*,—at the commanding passes of the countries between the Ottawa, the Great Lakes, and the Mississippi; and a leading principle of their policy was to secure an authority, parentally despotic, over the whole aboriginal mind of the people, who inhabited the vast regions west, and north, of the Alleghanny mountains.

In 1672, M. Talon, who, during the period he held the office of intendant-general, in which he was succeeded by M. de Chezneau, had extended the authority of France into the most distant parts of Canada, concluded, from the reports of the Indians to the Jesuits, that there flowed west of the Great Lakes a magnificent river, which some of the native tribes called Mississippi, and others Mesha-shepi; and the course of which flowed towards the south. He therefore determined not to leave America until he should ascertain the truth of this important information. For this purpose he employed Father Marquette, who had previously travelled over the greater part of Canada, and who was, besides, peculiarly qualified to gain the confidence and esteem of the savages. M. Jolliet, a merchant of Quebec, and a man of well-known abilities and experience, was associated with Father Marquette, in order to examine more fully the commercial resources of the countries they should discover. They proceeded to Lake Michigan, ascended the Fox River, which falls into an arm of that lake called Green Bay, up to near its source; from whence they crossed the country by a short portage said not to be a league over to the River Esconsin, or Winconsin, which they descended, until it unites with the Mississippi, in about latitude 42 deg. 50 min. The magnitude and depth of the Mississippi, even at this point, so many thousand miles from its mouth, exceeded the most exaggerated accounts they had received from the Indians. They floated down its stream, which was deep, smooth, and seldom rapid, in a bark canoe, until they arrived at some villages of the Illinois, a few miles below the confluence of the Mississippi and the Missouri. The Illinois, who had heard of, but never before seen, the French, seemed anxious to form an alliance with them; and they treated Marquette and Jolliet with great hospitality.

Leaving the Illinois, they descended the river to Arkansas, in about 33 deg. N., when the exhausted state of their stock, and being convinced that the river disembogued in the Gulf of Mexico, induced them to return. They ascended the Mississippi, to where it receives the Illinois, up which they proceeded, and then crossed the country to Michigan, where they separated; Marquette remaining among the Miamis, while Jolliet proceeded to Quebec.

Although the Mississippi was thus discovered, by a route through Canada, yet the advantages which it held out were neglected for some years, in consequence of the death of Father Marquette, and the return of M. de Talon to France.

In 1678, the *Sieur de la Salle*, accompanied by the *Chevalier de Tonti*,

arrived from France: he had previously spent some years in Canada, where he maintained a favourable understanding with M. de Frontenac. The king having granted him the seigniory of Cataraqui, he proceeded thither, and built the fort with stone. He then constructed a vessel, and sailed to Niagara, accompanied by Tonti and Father Hennepin, a Flemish Recollet. Here they remained during the winter, attending to the fur trade; and in the following summer they built a vessel for navigating Lake Erie. They sailed up that lake, and proceeded afterwards, by different routes, to Mikilimakinak.

Hennepin then proceeded to the Illinois, and La Salle returned to Cataraqui. Hennepin was afterwards despatched to the Mississippi, which he ascended to the falls of St. Anthony. Three years were spent by La Salle, Tonti, and Father Hennepin, in exploring those vast and wild regions, and endeavouring to secure the alliance of the savages, and the gains also of the fur trade. Their sufferings, on many occasions, were exceedingly severe; and the difficult situations, in which they found themselves among the Indian tribes, required extraordinary address, resolution, and endurance.

On the 2nd of February, 1682, La Salle, having reached the Mississippi, determined on sailing down to the ocean. On the 4th of March, he reached Arkansas, of which he took formal possession; and on the 9th of April he arrived at the sea, by one of the channels which leads the Mississippi through its delta to the ocean. He returned by the same route to Canada; but suffering severely from fatigue and sickness, he first sent De Tonti before him with the news of his discovery. He afterwards returned for France, where he was favourably received; and having been enabled to sail with some ships for the Gulf of Mexico, he landed to the west of the place he intended; and soon after, this remarkable and bold man perished, in the manner which will be found hereafter stated in our account of the French settlements and projects on the Mississippi.

The vast regions discovered by these adventurous men have opened an arena for the boldest schemes, and their progress will require, at a subsequent period, a separate chapter.

CHAPTER XVIII.

JEALOUSIES OF FRENCH AND ENGLISH IN REGARD TO THE FUR TRADE, &c.

THE peace of Canada still continued to be disturbed by various causes, which readily excited the ferocious spirit of the Iroquois, and which involved the Hurons, Algonquins, and Abenakis, in the wars occasioned by their suspicions, or by the jealousies of the French and English colonists.

The French had long supplied the Indians, in exchange for furs, with various articles of European manufacture, particularly coarse red cloth, which the English colonists were enabled to sell at a much cheaper rate; and there were, besides, no restrictions on the trade, nor any duty on the furs at New York. The English, also, in order chiefly to engross as great a share as possible of the peltry trade, formed an alliance with the Iroquois; and, as the scruples of honour were not regarded with much delicacy by those employed either by the French or English at their trading posts, whenever their profits were at hazard, fresh difficulties were created among the Indian nations, which were always followed by renewed hostilities on the part of the Iroquois against the French.

Soon after the appointment of M. de la Barre, as successor to M. de Frontenac, the Iroquois assumed such a tone of defiance, and made such formidable preparations, as to cause the greatest apprehension of a general war among the Indians; and the condition of Canada at this time (1683) was far from that state of prosperity, which it ought to have attained, and which was prevented solely by the mismanagement of an exclusive company, who cared little for the country, so long as they monopolised the fur trade.

The whole population consisted only of 9000 inhabitants; and M. de la Barre, to prevent the extermination of the colonists, anticipated the preparations of the Iroquois, by making an expedition to their country, with about 1000 troops, which ended, after his experiencing great hardship, in an unsatisfactory negotiation; which, however, in the meantime, gave assurance of peace.

The Marquis De Nonville arrived in Canada soon after, with a strong reinforcement, as governor-general. He immediately proceeded to Cataraqui, with about 2000 troops, where he asserted that the Iroquois had assumed a spirit of defiance; that all attempts to reconcile, or assimilate them to the French, were altogether fruitless; and that this tribe alone prevented the conversion of the others.

The latter reason—paramount, or rather, in that age, pretended to be so, to all others—was considered more than sufficient to justify any measure against the Iroquois, whose extinction, as a nation, seemed determined upon by the governor; and directions were also received, some time before, to send to France all able-bodied men of that tribe, who were made prisoners, as slaves for the galleys.

This order, indefensible under the most aggravating circumstances, was executed with the utmost baseness and treachery by M. De Nonville, who even employed two missionaries to effect his purpose. These men, particularly the priest de Lamberville, had gained such influence over several of the principal Iroquois chiefs, as to induce them, under various pretences, to meet M. De Nonville at Fort Frontenac, where he immediately loaded them with irons, and sent them to France, where they were condemned to the galleys.

This act of infamous perfidy stamped eternal dishonour on the French name among the Iroquois ; yet did this people, whom we call barbarians, allow Lamberville to depart in peace ; and it was this same priest who afterwards induced them to attend to pacific overtures.

The other missionary fell into the hands of the Agniers, who condemned him to the flames ; from which, he is said to have been saved by a woman who adopted him.

Although M. De Nonville received instructions from France, that a treaty was signed at London by the governments of France and England, stipulating that, whatever difference should arise between them in Europe, their subjects in America should remain in perfect neutrality ; and, although the Governor of New York remonstrated against his building a fort at Niagara, and urged that the Iroquois were the subjects of England, yet he persisted in his imprudent purpose of building a fort there, at a time when the seizure of the Iroquois chiefs, which had renewed the passion of revenge with unexampled fury among their warriors, formed the greatest obstacle to peace that had occurred since the French first settled in Canada.

The war had only partially commenced, when Fort Frontenac was attacked by the Iroquois, who also burnt all the corn-stacks in the neighbourhood ; and 500 of their canoes, which were on Lake Ontario, captured a French bark laden with provisions and stores. The Abenakis, allies of the French, attacked at the same time the Iroquois of Sorrel, and committed depredations on the English settlements : plundering the property, and scalping several of the inhabitants.

In the meantime, the Iroquois acted with great policy ; and while they made overtures for negotiation, they were accompanied by preparations not to be disregarded.

Deputies, attended by 500 warriors, were sent to treat with M. De Nonville ; and the lofty tone assumed by their orator, in stating the condition of his nations, and it being known that there were 1200 warriors within a short distance of Montreal, who could immediately fall upon the settlements, set fire to the buildings and corn-fields, and murder the inhabitants, induced the governor to accept the conditions of peace which they proposed, and to send without any delay for their chiefs, who were then chained to the galleys of France.

The ratification of this treaty was, however, prevented by the political management of a young Huron chief, worthy of the most refined disciple of Macchiavelli ; and conducted with sufficient address and skill to rank this savage in the annals of political intrigue, with the Borgias of Europe ; while his callous disregard to scruples, in seizing the means necessary to accomplish his ends, affords an example of dark resolute perseverance, not surpassed in the registers of diabolical policy.

Kondiaronk, or Le Rat, called also Adario, by La Hontan, and by the

English at New York, although not forty years of age, rose by the power of his eloquence, bravery, skill in hunting, and success in the enterprises he planned and conducted, to be the chief in war, and the first in council among the Hurons. He inherited inveterate hatred towards the Iroquois; and their total extermination from his youth, was the ruling passion of his soul. He hated the French in his heart; but his nation considered their friendship useful in protecting them against the Iroquois; and he hated the English also, as the allies of the latter, with all the animosity which an Indian bosom can cherish; but policy made him conceal his feelings, while his people found it more convenient, or more profitable, to sell their furs to the English than to the French traders.

M. De Nonville solicited, and pressed for, his alliance, to which Le Rat consented, on the sole condition that the war should only terminate by the extinction of the Iroquois nations. On this assurance, he soon after left Makilimakinak, with a chosen band of 100 warriors, in order to surprise the Iroquois, and to acquire additional fame by some brilliant exploit. He stopped on his way at Fort Frontenac, where he was informed by the commandant that M. De Nonville had entered into a treaty with the Iroquois nations, whose deputies he daily expected, with hostages to be left at Montreal for its final ratification. Le Rat, who was also told that it was consequently necessary for him and his warriors to return to Makilimakinak, suppressed the feelings that were maddening in his bosom, and very coolly observed that the request was reasonable. He then left the commandant, under the impression that he would return peaceably with his warriors to his own country. Far different, however, was the resolution of Le Rat. He considered his whole nation, in not being consulted before treating with their enemies the Iroquois, insulted by a species of contempt, the most galling to the proud heart of an American Indian; while the brilliant achievements, he anticipated on leaving his tribe, with the flower of their warriors, were at the same time completely blasted. Conceiving, therefore, that his own fame and the honour of his nation were sacrificed to the interests of the French, he formed a plan of terrible revenge; which the deep address and perseverance of this fiend carried into full execution. What was said by the courtly Clarendon of Hampden, but without truth in respect to that patriot in the last words of the sentence, may be justly said of Le Rat:—"He had a head to contrive, a tongue to persuade, and a hand to execute any evil." Instead of returning to Makilimakinak, he proceeded with his warriors to the cascades, which are about thirty miles above Montreal, and where he knew the Iroquois deputies, with their hostages, would pass. Here he remained in ambush, waiting for the deputies, who arrived in a few days, accompanied by forty young men. He surprised them as they landed from their canoes, killed several, and made the remainder prisoners. He then told the captives that he was directed by the governor to occupy that position, in order to intercept a party of Iroquois warriors, who were to advance by

that route to plunder the French settlements, and that he must immediately conduct them as prisoners to Montreal, where there was not the least hope of mercy for them. The deputies amazed at this intelligence, and their passions having been aggravated to fury, by recollecting that their chiefs were not yet sent back from France, considered the conduct of M. De Nonville, and particularly this last apparent act of infamous perfidy, more horrible than all that their imagination had attributed to demons. They then related the object of their mission to Le Rat, who feigned astonishment ; and after remaining a short time silent, and seemingly affected with sorrow, assumed a ferocious air and tone, and declaimed, with all the ingenuity and force of his eloquence, against M. De Nonville, for having made him the instrument of the most diabolical treachery. He then released the prisoners, and told them to return and tell their tribes that the governor of the French had made him engage in a deed so horribly treacherous, that he should never rest until he had satiated his revenge by the destruction of the French settlements. The Iroquois believed Le Rat ; and his apparent clemency in setting them at liberty, so fully persuaded them of his sincerity, that they assured him that the five nations would immediately ratify such terms of peace with the Hurons, as they might then agree upon. He then gave them fusils, powder, and ball, to defend them on their way back ; and under the pretence of replacing one man whom he had lost in attacking the Iroquois, he retained an Indian of the Chouanan tribe, with whom he returned to Makilimakinak.

This unfortunate prisoner, who believed himself safe, from Le Rat telling the Iroquois that he would retain him as an adopted son, was delivered to the French commandant, who was still ignorant of the proceedings of M. De Nonville, and who, through the statements made by Le Rat, condemned the unhappy wretch to be shot.

Le Rat had an old Iroquois slave for a long time in his possession, to whom he afforded the opportunity of witnessing the execution of his adopted countryman by the French, all the circumstances of which, however, he carefully concealed from him. He then told the Iroquois, "I now give you your liberty ; return to your country, and there spend the remainder of your days in peace. Relate to your people the barbarous and unjust conduct of the French, who, while they are amusing your nation with offers of peace, seize every opportunity of betraying and murdering you ; and that all my persuasions could not save the life even of one man of your tribe, whom I adopted to replace the warrior I lost at the cascades."

The Iroquois returned to his country, and related what he had witnessed, together with all that Le Rat had told him. The Iroquois warriors, as might be anticipated, were even before this sufficiently exasperated ; but this last master-stroke of Le Rat's policy made their very blood boil furiously for revenge ; yet they dissembled their feelings of resentment so completely, that M. De Nonville,

who declared that he would hang *Le Rat* whenever he could be captured, still expected deputies from the Iroquois to ratify a peace.

Le Rat's policy, however, operated more effectually than all the attempts of *M. De Nonville*; and when the Iroquois arrived at Montreal, where the governor waited for their deputies, their appearance and purpose was indeed far different from what he expected. Twelve hundred warriors, who landed at the upper end of the island, plundered and burnt all the houses and corn-fields; destroyed and carried off the cattle; massacred men, women, and children; defeated and cut in pieces nearly the whole of 100 regular troops, and fifty Hurons, who were sent to defend the approach of the town, and carried off about 200 prisoners.

After spreading devastation over the whole island, with the loss only of three warriors, they embarked in their canoes with their plunder and their prisoners. One of the three Iroquois warriors captured, was brought before the governor, and declared, that the effect of *Le Rat's* policy was irreparable; that the Iroquois, far from condemning him, were ready to enter into a treaty with his nation; and that all the Iroquois tribes were so deeply impressed with a belief in the infamous atrocity of the French, that their thoughts were solely bent on the most deadly revenge.

Their subsequent hostilities fully justified this information; and the devastation of the island of Montreal was attended by other losses and calamities. The fort, which had been erected at much expense and labour at Niagara, was garrisoned by 100 troops, among whom a malady was introduced, which proved fatal nearly to the whole; and the survivors, finding it impossible to maintain the post, abandoned and demolished it.

It was even found impracticable to maintain the important fort at Frontenac. It was also abandoned and blown up: and two ships that were built for the purpose of navigating Lake Ontario, were burnt to prevent their falling into the possession of the Iroquois. The same malady which was so fatal to the garrison at Niagara, prevailed at the same time all over Canada; and the affairs of the colony appeared altogether desperate. War, famine, and disease seemed combined for the destruction of the French inhabitants.

CHAPTER XIX.

PERILOUS CONDITION OF CANADA.

THE critical condition of Canada, and the war between England and France, imperatively required, that the affairs of the colony should be intrusted to a person, whose experience, and abilities, would give energy to the execution of his

measures, and whose activity, resolution, and firmness, would command the respect of the Indians, and exact implicit obedience from those under his command.

These qualities in a person to manage, to govern, and preserve a colony, with its affairs in a posture like that of Canada, were found to be only combined in the Count de Frontenac. He was accordingly appointed to the chief command, and arrived at Quebec in October, 1689, accompanied by the Chevalier de Callieres, as intendant, and the Iroquois chiefs who had been sent to France by De Nonville.

He found the colony on the utmost verge of ruin; but he expected that the great personal esteem which the Iroquois and other Indian nations entertained for him, during his former administration, and the confidence which was reposed in him by Ourèharè, one of the Iroquois chiefs whom he brought back, would enable him to bring the five nations to pacific overtures.

He was, however, disappointed. The Iroquois, while they pretended to wish for peace, avoided, with great address, coming to serious negotiations; and they soon renewed their hostilities, by rushing suddenly on the settlements, killing or making prisoners of the inhabitants, and carrying off all the moveable property.

M. de Frontenac, finding his attempts at negotiation useless, resolved to act with such determined vigour as eventually to humble the Iroquois confederacy, which alone prevented the French settlements enjoying any certain repose. He therefore collected his allies, divided them among his regular troops, and surprised, with great success, several of the English settlements, on account of their alliance with the Iroquois. Detachments which he sent to convey to Montreal the furs stored for a long time at Makilimakinak, met also with a numerous band of Iroquois warriors, whom they defeated after a sharp skirmish, in which a great number were killed on both sides.

Although peace could not be secured with the five nations, yet they were convinced that M. de Frontenac was more to be dreaded than his predecessor; and the other tribes, who were about joining them, declined the alliance. An expedition, fitted out under the command of Sir W. Phipps, for the conquest of Quebec, appeared in October, this year (1690), as far up the river as Tadousac, before its destination for Quebec was known. The defence of the town required all the vigilance of M. de Frontenac, and he certainly lost no time in placing it in a fit condition to stand a siege. The squadron, consisting of thirty-four vessels of different descriptions, and said to have 7000 men on board, advanced as far as Beauport, when Phipps sent a flag of truce summoning the town to surrender, which was gallantly rejected by M. de Frontenac. On the 18th, the English troops disembarked near the river St. Charles, but not without great loss by the sharp fire from the French musketry. Four of the largest ships, which anchored op-

posite the town, commenced a bombardment; but the fire from the batteries was directed with such effect as to compel these vessels to remove up the river, beyond the range of the fortifications. A sharp skirmish between the troops took place next day; and, on the 20th, an action was fought, in which the English at first had the advantage, and pursued the French to the palisades of a large house, at which the latter made a gallant stand, and compelled the former to retreat towards Beauport, from which place they re-embarked two days after, when Sir W. Phipps raised the siege, and sailed with his squadron down the river on the 23d. Seven or eight of his vessels were lost in the Gulf of St. Lawrence.

Before he left Boston, it was arranged that a strong body of troops should march against Montreal, in order to create a division in the French forces. This was prevented by the defection of the Iroquois; and M. de Frontenac was consequently enabled to concentrate all his strength to defend Quebec. This circumstance, the failure of ammunition, and the approaching winter, rendered it expedient for Phipps to abandon the enterprise.

On the following year the Iroquois renewed their depredations. About 1000 warriors appeared at the mouth of the Ottawa, landed on the island of Montreal at Point au Tremble, pillaged and burnt thirty houses and barns, and carried off several prisoners, whom they put to the most cruel tortures. Depredations and cruelties were also extended to many of the other French settlements, and various skirmishes took place between the French troops and the Iroquois, in which great numbers on both sides, and several French officers of rank and distinction, were sacrificed. The French, at last, treated their prisoners with nearly as much cruelty as was practised by the Indians; and M. de Frontenac, at length, by the unremitting vigour of his measures, secured the defence of the colony so far, that in 1692 the inhabitants were enabled to cultivate their lands. The commerce in furs, although frequently interrupted, was also renewed and carried on with considerable advantage.

In 1695, the fort at Frontenac was rebuilt, and additional security extended to the outposts at Makilimakinak and St. Joseph. In the following year M. de Frontenac made an expedition to the country of the Iroquois; and, without proceeding to such extremities as his force empowered him, he burnt some of their villages, and liberated a number of French prisoners.

He might, it is thought, have completely humbled the Iroquois at this time, but could not be prevailed upon to destroy the canton of Goyoquins, of which Ourèharè was the chief.

A fishery was also begun about this time at Mount Louis, on the south coast of the St. Lawrence; and the missions and the trading posts were increased.

The French suffered little further molestation from the Indians; but animosities still continued between the Algonquins and Iroquois, and frequent hostili-

ties among the other tribes. Ourèharè, in whom M. de Frontenac placed great and deserved confidence, and through whose influence he expected to bring the Iroquois to terms of friendship and permanent peace, died this year at Quebec.

Peace was concluded by England and France in 1698; and the English and French governors entered mutually into arrangements for maintaining harmony with the Indians. Although either the English or French could now have crushed for ever the power of the Iroquois, yet the anxieties manifested by each government to conciliate the regard of that nation, were carried to an extent, which gave them an opinion of themselves that nothing but the jealousies of the English and the French could warrant, and of which the Indians well knew how to avail themselves.

Soon after the conclusion of an understanding of friendship with the Iroquois, Louis, Count de Frontenac, died in the seventy-eighth year of his age, twenty of which he spent in Canada; where his vigorous administration, and his great personal abilities, preserved the colony with little assistance from France, and always secured him the confidence of the king, the respect of his officers, even of those opposed to many of his measures, and the esteem of the Indians.

He was succeeded by the Chevalier de Callieres, who had been for some years governor of Montreal, which office was supplied in the person of Chevalier de Vaudreuil. Some difficulties arose soon after in maintaining a good understanding with the Indians, which were principally occasioned by the English governor; but the address of the French missionaries gave M. de Callieres an ascendancy, which he held with great tact and able management, until his death in 1703. His loss was great to Canada; and although his powers of mind wanted the splendid points that cast such brilliant lustre on the government of M. de Frontenac, yet, from his great excellence of character, he was beloved and respected by all; and having never violated his word to the Indians, he always retained their implicit confidence.

The Marquis de Vaudreuil was then appointed to the chief command, on account of his great services in Canada; and agreeably also to the unanimous petition of the inhabitants to the king. The Indian tribes, among whom jealousies were fomented by the English, and by numerous murders among themselves, occasioned much embarrassment in the affairs of Canada during the administration of M. de Vaudreuil. He, however, managed to prevent the colonists from being molested, and the trade and cultivation of the country continued to improve and prosper. The Jesuit missions were also further extended.

England and France being again, in 1709, at war, an expedition was sent from New York, which was joined by a great body of Iroquois and Michigans. M. de Ramsay, with 1000 regular troops, together with a body of militia and Indians, were sent to intercept them; but the want of confidence in this

commander, or some jealous feeling entertained by the other officers, rendered the expedition fruitless, and it returned to Montreal with a few prisoners only.

M. de Vaudreuil, however, lost no time in putting Quebec in a proper state of defence, and took every precaution, by strengthening the outposts, to prevent the English entering Canada.

The English were at this time fully confident of success, but the policy of an Iroquois chief not only blasted the hopes they had reasonably entertained, but subjected the army to the most severe distress. While the Iroquois warriors were exulting in the prospect of destroying the French, this crafty leader, to whom they had always listened with respect and deference, said to his people, "Ah! but I have been considering what will become of us, if we destroy the French, who keep the English in check. The latter will then assuredly crush us, in order to possess our country. Let us not, therefore, foolishly bring certain ruin upon ourselves, merely to indulge our passions, or to please the English. Let us rather leave the French and English in a position, which will make either of them set a high value on our friendship." This was their former and favourite system, but as they considered it shameful to desert the English openly, they concluded on effecting their purpose by enveloping their treachery under the most profound secrecy and diabolical cruelty. "The lawless savages," says Raynal, "the religious Hebrews, the wise and warlike Greeks and Romans,—in a word, all people, whether civilised or not, have always made what is called the rights of nations to consist in craft or violence."

The English army halted on the banks of a small river where they encamped and waited for the artillery and ammunition, which were following at a slower rate than the march of the main body of the troops.

The Iroquois, who, in the meantime, spent their leisure hours in hunting, flayed all the animals they killed, and sunk their skins in a river, a little above the English camp. The English, who had no suspicion of the fatal treachery, continued to drink of the poisoned water; and so many were carried off in consequence, that it soon became necessary to suspend all military operations. They were, therefore, compelled to return to New York, where they learned that the destination of the fleet, which was to proceed with troops to besiege Quebec, was changed, and sent to Lisbon to protect Portugal from the Spaniards. The English colonists soon after renewed their preparations against the French; and an army, accompanied by some Iroquois, marched towards Canada; but, meeting with great difficulty, they returned, on receiving information that a second fleet, with the troops intended to besiege Quebec, was dispersed, and eight of the largest vessels lost near Seven Islands Bay.

M. de Vaudreuil had, however, by this time, managed to engage some numerous bodies of Indians, and to fortify Quebec so strongly, while he, at the

same time, guarded the advanced posts with such vigilance, that even if the fleet, and the troops, from New York, had arrived safely before Quebec, there would have been little risk of France losing Canada, although there would have been, in all probability, great loss of life on both sides. The treaty of Utrecht, in 1712, gave peace to Canada, and M. de Vaudreuil had now leisure to direct his attention to the local affairs of the province.

A little before this time, a powerful tribe of Indians, called the Autagamis, or the foxes, were instigated by the Iroquois to besiege Detroit, where they built a fort near that of the French. The allies of the latter, however, arrived in great numbers, and a furious attack was made upon the fort of the Autagamis. The latter defended themselves with extraordinary obstinacy; but, finding that nothing but death awaited their surrender, they contrived to escape from the fort at night, during a snow-storm. They were, however, soon afterwards overtaken, many of them massacred, and the remainder, amounting to 150 men, women, and children, were distributed among the allies and nearly all put to death. The loss of the Autagamis amounted to about 1000, and that of the allies to no more than sixty. The result of this expedition prevented the English from building a fort at Detroit, as they intended, which would have been almost ruinous to the fur trade of Canada.

Soon after the treaty of Utrecht, the English built a fort on the banks of Lake Ontario, which secured them a great share of the fur trade. The French also rebuilt a fort at Niagara, and strengthened their garrison at Detroit, which commanded the great line of intercourse in their dealings with the Indians of the west, as well as the tracks of communications with Louisiana, the Illinois, and the Mississippi, which was frequently interrupted by the warlike Autagamis, and their allies the Sioux and Chicasaws. M. de Vaudreuil at length brought those tribes to pacific overtures; and as a means of increasing the population of the French settlements, and strengthening the garrisons, he proposed that 150 of the convicts which were condemned in France to the galleys, should be annually sent to Canada.

At this period (1714), there were no more than 4500 men, from fourteen to sixty years of age, able to bear arms in all Canada, while the English colonies could raise about 60,000. During the remainder of M. de Vaudreuil's administration, terminated by his death in 1725, the French colonists enjoyed the blessings of peace, and the cultivation and trade of the province prospered under his vigilant, firm, and just government, which for twenty-one years was attended with the approbation of his sovereign, and the esteem and admiration of those under his command.

The Chevalier de Beauharnois, who succeeded to the government, planned an unsuccessful enterprise to cross America to the South Sea; and he also erected an important fort at Crown Point, with several others, in order to keep

the English east of the Alleghanny Mountains. During his long administration the interests of Canada were generally attended to; the colony enjoyed the blessings of peace; some important changes were made in the laws; several church decretals, which clogged industry and pressed heavily upon the people, were repealed; and the conduct of the nuns, which was for some time complained of as irregular, and very different from the vows by which they pretended to regulate their character and habits, was controlled. In 1745, a royal edict directed that no country houses should be built but on farms of one acre and a half in front, by forty back. This law confined also the resident population along the banks of the rivers.

Expeditions were made from Canada to Hudson Bay before this period; one of these as far back as the year 1659: and adventurers from Acadia had also resorted to Hudson Bay. But it does not appear that the French ever had any trading ports established there, though they made claims to parts of it, as having been discovered by Frenchmen who traversed the wilderness by land from Canada to Prince Rupert's River.

CHAPTER XX.

FRENCH SETTLEMENTS IN LOUISIANA.—MISSISSIPPI SCHEME.

THE countries through which the Mississippi flows into the Gulf of Mexico, and which were first explored below the Arkansas, by La Salle, comprise all the abundant advantages of soil, minerals, forests, climate, capabilities of production, navigable rivers, and extent of territory, which form the elements of one of the most populous, rich, and powerful empires in the world.

The descriptions of the first discoverers, and even of those who projected the disastrous schemes for deriving prodigies of wealth from the Mississippian regions, can scarcely be considered as exaggerated; though the fatality attending the early expeditions, and of the subsequent fraudulent schemes, formed sufficient grounds for the public to consider those countries, for a long period, of inferior importance.

La Salle* was justly persuaded that the territories which he had traversed were capable of producing the greatest advantages to France. He was a native of Normandy. He passed his early life among the Jesuits, and acquired in their society, and amidst the wild regions, into which they had penetrated, habits of activity, and the power of enduring great fatigues, and of suffering extreme pri-

* Robert Cavelier, Sieur de La Salle, having joined the Society of the Jesuits when young, was in consequence excluded from his heritage.—*Thevenot*.

ventions. He was enthusiastic, brave, and possessed those qualities of mind, and the talents which inspired the confidence, if not the affection, of others in whatever enterprise he undertook. He is accused of having an unbending will, and of regarding with haughty indifference the opinions or advice of other men. Finding that the Governor of Canada did not appreciate the value of the countries which he and the Jesuits had discovered, he sailed for France. He had previously, assisted by M. Tonti, son of the celebrated projector of the *Tontines*, established posts at different points, as lines of communication, and as headquarters for the fur trade, and of the religious missions, between Canada and the Mississippi. At the court of Versailles, he finally succeeded in procuring, by order of the king, from the marine department, a small squadron, to proceed under his orders to the Mississippi. This expedition consisted of a frigate of the royal navy, carrying forty guns; a small sloop of war, which the king gave as a present to La Salle, and mounting six cannons; a store-ship of 300 tons, laden with provisions, some horses, and other articles for the intended settlements; and a pinnace, of about thirty tons, laden with various stores. On board of these vessels there embarked La Salle and his two nephews, Cavelier and Moranjet, one not more than fourteen years; three ecclesiastics of St. Sulpice, one of which was the brother of La Salle; four Recollet priests; about thirty who embarked as carpenters and artisans; 100 soldiers; several volunteers; several girls; the Canadian family of Talon; and Joutel of Rouen, whom La Salle appointed as his intendant: in all, including the commanders, officers, and crews of the vessels, 280 persons. La Salle was commissioned to take under his command the countries, and all the French and Indians, from the Illinois to the Gulf of Mexico.

Beaujeu, the captain of the frigate, as well as the whole squadron, was also placed under the direction of La Salle, and they sailed from Rochelle, on the 24th of August, 1684. During the voyage, Beaujeu manifested a sullen jealousy of his authority, and an unpleasant understanding with La Salle was the consequence. It was evident that Beaujeu wished that the expedition should miscarry. By his carelessness, the pinnace, which carried valuable stores, was captured, off the island of Hayti, by two Spanish boats. On the 28th of August they arrived off the southern shores of Florida, and, soon after, within the Gulf of Mexico. After searching a long time for the entrance of the Mississippi, which they actually had passed on the 10th of January, 1685, as they were informed by some natives, Beaujeu not only refused to obey La Salle's commands to return to it, but proceeded 100 leagues further west, and came to, and anchored at, the entrance of the Bay of St. Barnard, west of where Galveston, in Texas, now stands. La Salle landed, and finding a magnificent stream flowing through a fertile territory, conjectured that it might be one of the western mouths of the Mississippi. Wearied also with the long voyage, and the per-

verseness of the commander of the frigate, and finding that he had been miserably deceived in the character and ability of those who were sent out with him; that the men who had embarked as artisans were impostors; and that the soldiers were decrepid and worn-out men, who had been disbanded as unfit for service in France, he determined to land the stores, and the people who were to remain. He ordered his small armed vessel to enter the bay; and finding that the depth of water over the bar was not more than twelve feet, he directed that the store-ship should be lightened to that draught, by landing part of the cargo. Extreme negligence, in attending to this order, was manifested by the master, as well as by Beaujeu. La Salle then directed the captain of his own vessel to carry out his instructions. The master of the store-ship considered this as derogatory, and instead of steering by the proper channel, he most treacherously ran the vessel on a reef. Part of the stores was saved, but the vessel breaking up, the greater part was lost. The ecclesiastics, and those who were to remain in the country, were landed; but before the necessary preparations were made, Beaujeu took on board the master and crew of the store-ship, and immediately after deserted La Salle, and sailed away from the coast.

Two hundred and twenty persons were landed at the bay of St. Barnard. La Salle chose a place for a fort, which he commenced erecting, but afterwards abandoned for a more favourable position, where he constructed one: directing the works himself, and but wretchedly assisted by those who had been imposed on him as artisans. He then traversed the shores of the bay with his small vessel; landed at several places, and was absent from the fort nearly three months. In order to explore part of the interior he left his vessel in charge of a lieutenant and crew, who contrived to wreck her on the shallows which extend from the coast. During his absence from the fort, the people he left there mutinied; some were killed by the natives, who proved a fierce race; others perished in the country; and La Salle had the mortification to find his plans for settlement impracticable, with the people whom he now had to manage, and who were, unlike those with whom he travelled and explored the interior of America, totally unfit for colonising a new country. The best of them had been brought up in France, utterly destitute of the training necessary to endure the fatigues which attend exploring unknown and wild regions. He therefore resolved to traverse the interior to the Illinois, and departed with five horses and sixteen men, on the 12th of January, 1686, and proceeded on his travels. He also constructed a portable canoe for crossing the rivers. On the 17th of May, some of those under him murdered his Indian huntsman and his principal servant, and one of them, on being discovered shot La Salle through the head.

Thus perished one of the most enterprising and bold men that France ever sent to America. After his death the assassins murdered one another, or joined the Indians. Of those left at St. Barnard's Bay, some died of hunger, fatigue,

and the climate ; some were captured by the Spaniards, and sent as slaves to the mines ; others who lived within the small fort were attacked and massacred by the natives. Of all who landed with La Salle, only seven escaped. They found their way by traversing the forests and ascending the rivers to Canada. Louisiana was then forgotten by France until 1697, when D'Iberville, a brave French Canadian, who had distinguished himself during the war, and at Hudson Bay, Newfoundland, and Acadia, sailed for France, and on representing the great capabilities of the Mississippian territory, the minister entrusted to his command two vessels, which sailed from Rochfort in 1699, and entered the Mississippi on the 2nd of July. He ascended the river as far as to be convinced, from his own observations, of the natural fertility and resources of the country, and of the magnitude of its internal navigation. He erected a fort which was soon abandoned, but instead of establishing his small colony consisting of French Canadians on the Mississippi, he chose for settlement a sterile part, east of the Mississippi, at a place without any harbour, called Biloxi. Two years after a number of new colonists arrived from France, and they were settled three leagues east of Biloxi on the banks of the unnavigable Mobile, and opposite an island, which they called Isle Dauphin, and within which there was found shelter for vessels. This place formed the head quarters of the French colonists, or rather traders, in Louisiana, until the sands, impelled by a violent storm, choked up the entrance to the anchorage within the Isle Dauphin. D'Iberville died at sea in 1702. After his death the colony at Louisiana languished. France was involved, at that period, in all the disasters, which rendered the decline of the reign of Louis XIV. so mortifying to that monarch, and so fatal to the prosperity of that country, and which formed the causes of many of the calamities, corruptions, and frauds of the following reign.

The whole of the French establishment in Louisiana was reduced to twenty-eight families, existing in a state of the most abject poverty. They subsisted chiefly on vegetables, with occasionally wild birds and animals, and were so poor and neglected that they had not the means of abandoning the ill-fated spot on which they had been left. Such was the state of the French colony in Louisiana, in 1712, when M. Crozat, a man of enterprising character, obtained a grant of the exclusive trade of that extensive country. His views were not directed to colonising and cultivating its soil, but to open a trade by contraband or otherwise with Mexico, through Louisiana, in order to obtain gold and silver in exchange for French, or other manufactures. He projected grand plans, which promised brilliant results ; and, it is possible that if his agents had conducted the affairs intrusted to them with fidelity, success and consequent profit would have been realised. Disgusted with their fraudulent conduct, and with other circumstances which he could not overrule, he voluntarily transferred his privileges to a company, the operations of which in a short time astounded the world.

The projector and founder of this scheme, which, from its fatal consequences, has been considered a monstrous delusion, was John Law, son of a goldsmith of Lauriston, near Edinburgh, where he was born in 1671. He was not brought up to any profession, but was considered a gentleman of great accomplishments, expensive habits, fashionable appearance, fascinating manners, and a persuasive speaker, either in conversation or on most questions that might be discussed, whether of a public or private character. His powers of financial calculation were admitted to be clear, practical, and comprehensive; and if the capabilities of the regions through which the Mississippi and its tributaries flowed, had only been explored and developed, by cultivation and by trade, to one-tenth the extent they have been since they came into the possession of the Anglo-Americans, the project of John Law, instead of involving so many thousands in ruin, might have realised, at least, a fair remunerating profit to those who gave their money in exchange for the paper which was presumed to represent the incalculably valuable property of the Mississippi scheme. But those who understood, and who could judge clearly of the moral, physical, political, and fiscal condition of France at that period, and of the consequent means by which the resources of the Mississippian territories, however rich and abundant, were to be developed, must have formed conclusions, very different from those brilliant delusions which enchanted the public mind of France.

Law had been, in early life, intrusted by the British ministers to arrange the revenue accounts of Scotland, which were found to be in a state of the utmost disorder, at the time of settling what was termed the equivalent, immediately before the union with England. This arduous task he accomplished very creditably. He afterwards brought forward his scheme for a national Scotch bank, which he proposed should circulate, for the encouragement of agriculture and trade, paper to the value of all the lands in Scotland. This project was very properly rejected by the Scotch parliament; though, if planned upon a scale not exceeding the annual rental of the lands, it would not have been less safe than the *land banks*, established successfully afterwards by Frederick the Great, of Prussia. This early banking scheme of Law formed the basis of all his future plans. It was certainly specious: inasmuch as landed property might be considered the most easily realised security. But the value of land, like the value of all kinds of property, will rise or fall in the proportion which the quantity in the market bears to the demand, and power to pay, for it. Law's scheme for a bank of Scotland, though rejected by parliament, not only influenced and gave rise to the Scottish system of banks, and especially to the Ayr bank, which adopted it, but, as Adam Smith very justly observes, we may attribute to the principles of his scheme the extensive paper currency which was afterwards circulated, as well as much of the banking principles, which, at this day, governs the paper money circulation in Scotland.

Law succeeded to the small estate of Lauriston, on his father's death, in 1704.

Its rents were inadequate to his expensive style of living; he gambled, won money, and fought a duel in consequence, killed his adversary, and fled from the kingdom. He passed over into Holland, where he studied, and brought under the scrutiny of his calculating powers, the fiscal condition and monetary system of that most practical of nations. He visited Italy, where he mixed with the aristocracy, laid bets, gambled, was almost invariably successful in winning money, and was banished, in consequence, from Venice and from Genoa. During his residence at both these commercial oligarchies, he applied himself as closely to the study of their fiscal and monied affairs, as he did to the calculation of chance, by which he ruined the most imprudent of them. He proposed a finance scheme to the Duke of Savoy, which would certainly have enriched the latter by impoverishing his subjects. It was in consequence rejected by a wise prince. It might have been accepted with avidity by an extravagant or ambitious monarch.

He arrived at Paris before the death of Louis XIV.; he presented his scheme. It was rejected by the financiers, Des Marets and Chamillard. Noailles examined his plans, by the direction of the Duke of Orleans, and reported favourably. By a decree of 2nd of March, 1716, the National Bank of France, planned by Law, was established, and he was placed at the head of its direction.

Long before the Mississippi scheme was projected by Law, the mind of this extraordinary person was occupied in watching attentively the relative condition, physically, morally, and fiscally, of all the European Powers, with the view of acquiring a thorough knowledge of their various resources and capabilities, and of their financial operations. The disordered condition which the ambition and extravagance of Louis XIV. had entailed upon France, was examined and thoroughly comprehended by Law. He beheld an empire which, during a period of forty years, had been viewed with jealousy and alarm by the other nations of Europe, reduced to a powerless and bankrupt condition. The whole nation was paralysed by the demands of an exchequer, which was unable to meet its engagements. The amount of the public debt had been dishonourably and most iniquitously reduced, in order that the decreased amount of the recognised liabilities of the state might increase the market value of the royal securities. This national bankruptcy did not, however, cause the effect intended; for the royal bonds still remained greatly below their original value. Liquidating the royal bills or treasury bonds was impracticable: for the interest nearly absorbed the entire public revenue. Law was consulted by the Regent Orleans, and intrusted with forming a scheme to relieve the treasury. In August 1717, he organised, under the name of The Western Company, an association whose stock should consist entirely of obligations which he named the Mississippian state securities. These *billets* or notes were received at their full value, although for the purposes of trade they were interchanged at a depreciation of fifty per cent. In the course of a few days, a capital of

100,000,000 livres, was raised. It is true that this sum was insufficient to found so powerful a colony in Louisiana, as its exclusive corporate privileges seemed to warrant: but the projector of this scheme held out more brilliant prospects to fascinate the public mind, and to obtain greater credit for the public treasury. From the day that Ponce de Leon landed in Florida, in 1512, in search of the fountain of health and youth, that region, and all those extending west to Mexico, and the Andes, were reported to contain, in abundance, the precious metals.

No man ever knew more thoroughly than Law did, the unbounded influence which the speedy belief of realising a fortune, by the possession of the precious metals, exercises over all the other passions of the human heart, or that more effectually distracts the human head into all the hazards of trading or gambling speculation.

The exclusive right to the precious metals, and stones, and of trading to the Mississippian territories, including Florida, was granted to the company, aided by the Bank of France. In consequence of this monopoly, and many other attractive privileges, the Senegal Company, and the French East India Company, were incorporated with the Mississippi, or Western Company. The shares soon rose to 500 per cent., and by a decree of 1719, the whole taxation and revenue of France were farmed to this company, with which the bank might also, as well as the whole trade of France with America, Africa, and Asia, be said to have been by the same decree incorporated. The condition of those exclusive, and, as declared at the time golden, privileges was to advance the government 1,200,000,000 livres (4,000,000*l.* sterling), at three per cent.

Law readily persuaded the French nation that the famed gold and silver mines of Louisiana were at length discovered, and that their power of production was far greater than had ever been anticipated. In order to give greater weight to a fabrication, eagerly credited, miners and labourers were sent out to commence working the mines, accompanied by a sufficient number of troops to protect them. This stratagem had its instant effect upon a people, always pleased with novelty: all were anxious to possess a share of the believed inexhaustible sources of riches; and, to the Mississippian regions were attracted all their credulities.

A further sum of 50,000,000 livres (2,000,000*l.* sterling) was paid the government by the company, for the exclusive privilege to the latter of working the mines for nine years. Foreigners also caught the infection. Germans and Swedes, were led to join the French emigrants, under an engagement that, on giving their gratuitous labour for a period of three years, they should then become entitled to the privileges of citizens, and consequently be entitled to hold lands in Louisiana. The stock rose in price to 1200 livres for every 100 livres of stock:—300,000,000 of livres (12,000,000*l.*) in addition to all former loans, were, in consequence, lent to the government; and such was the infatuation

of the public, that from November, 1719, to April following, the stock was purchased with such avidity, that its price rose to 2500 livres for every 100 livres stock. The bank-notes in circulation amounted to 100,000,000,000 livres, equal to 40,000,000%. This artificial circulation, though presumed to be represented, and capable of immediate realisation, by the national property, experienced the natural reaction of speedy depreciation. Bank stock and Mississippi stock decreased rapidly in value: the various expedients of Law were ineffectual in maintaining credit; and the unscrupulous regent reduced, by a decree, the artificial amount of both stocks to half their original value. Total ruin soon followed. While these tyrannical and fraudulent enormities were perpetrated in France, we will pass over to the attempts to colonise Louisiana.

During the years 1718 and 1719, the emigrants sent to Louisiana were indiscriminately crowded together, to the number of several thousands, on shipboard, and sent to sea, ill-provided with food and necessaries. They arrived at Isle Dauphin, where it was found that immense sand-banks had blocked up the harbour, and they could not enter: nor could they land at Mobile, from its port being completely destroyed. They proceeded to Biloxi, where several thousands, both of French and foreigners, were cast ashore without distinction, and without provisions or means of future maintenance. They were sent from France in utter ignorance of the country. If they had been landed, with ordinary means of support and sustenance, on the fertile territories bordering the Mississippi, which they could easily have entered and ascended, either in the ships which carried them from France, or in large boats, they might, with ordinary industry, have maintained themselves; yet, so great was the ignorance shown by those who had the direction of the expedition, that no such attempt was made. Soon after the return of the ships to France, in which these unfortunate people had sailed, it was found that the greater number of the vessels might easily have ascended the Mississippi; instead of which, those victims of fiscal and political fraud, were left to perish, under want and desperation, at the sterile and unhealthy Biloxi; the few who survived, were, five years afterwards, sent to the Mississippi, and settled at New Orleans. The monstrous delusion had totally vanished; the gold and silver mines, and all the wealth which they were to produce, were not to be found; and Louisiana, instead of being considered, as before, "the promised land of flocks, milk, and honey; of corn, oil, and wine; of gold, silver, and diamonds," was viewed with execration, and its very name became a term of odious reprobation. It was transformed in the public mind from an *El Dorado* to a country only fit for punishing criminals; and from the time the Mississippi scheme broke suddenly down, felons, and others of the most debauched character, were the description of men sent from France to the Mississippi.

With such worthless and depraved materials, and under such a vicious state

of circumstances, it was impossible for the population to increase in prosperity, or for the cultivation of the colony to advance upon any firm or permanent basis. Hundreds of the most degraded and miserable objects, in a complete state of nakedness, presented themselves for relief at some English and Spanish trading posts; others perished from a disease which they themselves had introduced; but the far greater number wandered through the forests until hunger and fatigue terminated their wretched lives. Meantime, the directors of the company, after making large advances, commenced, in the capital of France, drawing up plans of operation for regulating all enterprises in the New World. "Every proceeding," says Raynal, "was to be instituted at Paris by a conceited, hasty, and ignorant body of speculators, and the conduct of each inhabitant of Louisiana was to be fettered and confined in any manner, which might be viewed at the hotel of the company, as tending to favour a system of monopoly. Had they, on the other hand, held out some slight encouragement to the colonists, granting to every one his personal liberty of action, and the control over his property—such encouragements afforded to a class of proprietors guided by local experience and personal interest, would have offered a guarantee for results more satisfactory and durable—for establishments founded upon a more extensive and solid basis—than those which an exclusive system, with vast resources, but guided by incompetent agents, could ever hope to effect."

The French government considered that state necessity required that Louisiana should still be left in the hands of the company; but this corporation was, in 1731, constrained to re-purchase its monopoly for 1,450,000 livres.

During the period when a system of exclusive privileges had smothered the trade of Louisiana, premiums of 50, 60, 80, and 100 per cent, had been demanded, according to distance, for insuring merchandise exported to the Mississippi; and the price at which the produce of the colony was to be sold, was fixed by a most oppressive tariff. It was impossible for the colony to prosper under a system so vexatious and tyrannical, even if the colonists had been the most industrious and economical of mankind. In order to infuse some energy into the minds of the planters and traders, the government determined to assimilate the commerce of Louisiana to that of the French Antilles, and it was decreed, that the produce of Louisiana and its trade with France, should, during a period of ten years, be exempt from all duties of importation or exportation.

The settlement made at New Orleans, in 1717, was declared, in 1722, the chief place of the colony, and a plan for a town was traced, and streets were laid out, crossing each other at right angles. It was also intersected afterwards by canals. By degrees brick houses were constructed; and habitations rose on each side of the river. Some of the German emigrants cleared lands about ten leagues above New Orleans; and, with indefatigable industry, formed settlements, and for fifteen leagues dikes were raised to resist the overflowings of the Mis-

issippi. The grounds were well cultivated, and produced rice, maize, tobacco, and other products.

Little progress was afterwards made, further than erecting a fort at the mouth of the Red River, and digging through a narrow isthmus ten miles above New Orleans, a canal, through which the whole waters of the Mississippi forced their way, and abandoned their ancient channel; which flowed round for fourteen leagues, and which was soon filled up by a rapid growth of weeds and trees. The white population of Louisiana, under the French, is said not to have exceeded 6000 persons, scattered along the banks of the Mississippi, and defended along a distance of 500 leagues, by only three wretched forts. They consisted (with the exception of the few German and Swiss colonists who survived,) of the felons of France. Most of them perished in Louisiana, M. Raynal observes, "happily without reproducing their species." The most efficient colonists after the Germans and Swiss, were brave and hardy men, who had penetrated into the country from Canada; and these, with the Germans and Swiss, and several emigrants from the British provinces, who formed a settlement on the Mississippi, at a place called New Madrid, were the permanent founders of Louisiana. We shall, hereafter, notice the condition of this country after it was ceded to Spain, and before it was re-ceded to France, and sold to the United States of America.

CHAPTER XXI.

CONDITION OF CANADA BEFORE ITS CONQUEST BY THE ENGLISH.

IN 1746, the Count de Galissonière, a nobleman of great acquirement, succeeded M. de Beauharnois as Governor of Canada; but being unable to obtain that assistance in carrying his plans into execution which he expected from France, he held office only until 1747, when he was succeeded by M. de la Jonquière; who was also succeeded temporarily by the Baron de Longueuil, until the arrival of the Marquis du Quesne, in 1752, as governor-general. Preparations were made by him immediately after for active warfare with the English colonists, and hostilities were commenced against their traders on the Ohio. The Sieur de Vaudreuil Cavagnal succeeded him in 1755.

The English army, commanded by General Braddock, was repulsed this year; and on the following year the celebrated Marquis de Montcalm, who had arrived from France, with a strong reinforcement of regular troops, destroyed Fort Oswego, the outworks of Fort George, and the sloops and bateaux that were intended to attack Crown Point. Next year he reduced Fort George, but the

victory was disgraced by the massacre of 2000 of its inhabitants by the Indians under his command; which completely roused the indignation of the British, and led to those mighty preparations, which we have already noticed in the Historical sketch of Nova Scotia, and which finally destroyed the power of France in America.

The financial affairs of Canada, and the interests of private individuals, were also, about this time, placed in a ruinous position by the profligacy of M. Bigot, the intendant-general. His peculations, it was found, amounted to at least 400,000*l.*, the greater part of which he lavished on a mistress. His bills on the French treasury and orders to the amount of 3,333,333*l.* 6*s.* 8*d.* sterling, were protested. When the Canadians became British subjects, an indemnity was obtained for them of only 125,400*l.* in bonds, and 250,000*l.* in specie, for this immense debt.*

The annual expenditure of the government of Canada in the year 1729, was only 16,666*l.* 13*s.* 4*d.*, but it increased in 1759, to the enormous sum of 1,083,333*l.* 6*s.* 8*d.* sterling.

At this period, from 1753 to 1759, the fisheries and navigation of Canada employed annually only five or six small vessels in the seal and whale fishery, and one or two traded to the Antilles. Nine or ten arrived from the Antilles with ratafia, molasses, coffee, and sugar; and thirty vessels, of various sizes, from France, the whole tonnage of which did not exceed 9000 tons.

The imports from France in 1754 of manufactured goods, and other articles, amounted in value, reduced to sterling money, to 157,645*l.*; of rum, sugar, &c. to 59,123*l.*; total, 216,769*l.* The value of furs exported to France, amounted to 64,570*l.*; of oil, ginseng, capillaire, timber, &c., to 7083*l.*; of fish, oil, iron, &c., exported to the Antilles, and other places to 3906*l.* Total value of exports 75,560*l.*, leaving a balance of trade against the colony of 141,209*l.* to be paid by bills drawn by the intendant on the treasury of France.

When the French first took possession of Canada, they had scarcely any money. The little carried out by those who settled there was soon re-exported. This want of a circulating currency, retarded trade and agriculture. The court of Versailles, in 1670, ordered money to be coined for the use of the French American settlements to be valued one-quarter higher, for the same weight, than the money circulating in France. But this expedient did not answer, and towards the close of the seventeenth century paper money was substituted, in Canada, for the payment of the troops, and the other expenses of government.

* On further inquiry, we find the Canadians scarcely received any part of these immense claims, excepting a small proportion of the amount in specie. The French government, however, came to the resolution, several years after, to pay the bills or rescriptions due to the Canadians. These bills were purchased for trifling sums by capitalists. M. Beaujeu, a financier, made a profit, it is said of 18,000,000 of francs by the speculation; and it was these bills that actually insured the success of M. Necker as a rich banker, being the first step which led to his fortune.

This currency continued until 1713, when the engagements made by the administrators of the colony ceased to be fulfilled. The bills of exchange which they drew upon France were not honoured. They were liquidated in 1720, with a deduction of five-eighths of their nominal value.

Specie was then resorted to for about two years. The traders in Canada, and all those who had payments to make in France, found it inconvenient, expensive, and uncertain to remit specie, and they solicited the re-establishment of paper money. Billets were manufactured, bearing the arms of France and Navarre, which were signed by the governor, the intendant, and the comptroller. These billets were of the several values of twenty-four, twelve, six, and three livres, and of thirty, fifteen, and seven sols six deniers. The total value of all did not exceed one million of livres. This sum not being found sufficient for the public circulation, a larger quantity was supplied by command of, and signed only by, the intendant. The least of these, signed by him, were of twenty sols value, and the greatest of one hundred livres. These billets were circulated, as a substitute for money, until October, the latest period for the departure of ships from Canada. The bills were then converted into bills of exchange, drawn by the intendant on the French treasury. Considering the defective and corrupt state of the finances of France, we need not consider it surprising that the colonists of Canada should have suffered grievously from the dishonoured bills drawn by the intendant.

Fiscal dishonesty has always corrupted morals; and there is but little doubt that the profligacy of the administrators of the revenue in France, and the laxity of morals among those from whom the officers sent to Canada were chosen, superinduced on Canadian manners a share of the immorality and corruption, which the Abbé de Raynal ascribes to the character of the Canadians living in the towns. But we consider his description of the rural, and especially the agricultural, inhabitants highly exaggerated.

When he says that each agricultural family had from twenty to thirty sheep for their flesh and wool, ten or twelve cows for their milk, and oxen to plough the ground, and for their meat; also horses, small but hardy, in great numbers; and that such was the condition generally of 83,000 inhabitants settled on the banks of the St. Lawrence,—they could neither have been a very indolent nor an immoral population.*

* He observes, "that those whom rural labour fixed in the country, allowed only a few moments to the care of their flocks, and to other indispensable occupations during winter. The rest of the time was passed in idleness, at public-houses, or in running along the snow and ice in sledges, in imitation of the most distinguished citizens. When the return of spring called them out to the necessary labours of the field, they ploughed the ground superficially, without ever manuring it; sowed it carelessly, and then returned to their former indolent manner of life till harvest-time.

"This amazing negligence might be owing to several causes. They contracted such a habit of idleness during the continuance of the severe weather, that labour appeared insupportable to them, even in the finest weather. The numerous festivals prescribed by their religion, which owed its increase to their establishment, prevented the first exertion, as well as interrupted the progress

The eight thousand inhabitants employed in hunting and trading, and the inhabitants of the towns, may have deserved the character which he and Professor Kalm describes.

of industry. Men are ready enough to comply with that species of devotion that flatters their indolence. Lastly, a passion for war, which had been purposely encouraged among these bold and courageous men, made them averse from the labours of husbandry. Their minds were so entirely captivated with military glory, that they thought only of war, though they engaged in it without pay.

"The inhabitants of the towns, especially of the capital, spent their winter as well as summer in a constant scene of dissipation. They were alike insensible of the beauties of nature, or of the pleasures of the imagination. They had no taste for arts or science, for reading or instruction. Their only passion was amusement. This manner of life considerably increased the influence of the women, who were possessed of every charm except those soft emotions of the soul, which alone constitute the merit and the charm of beauty. Lively, gay, and addicted to coquetry and gallantry, they were more fond of inspiring than feeling the tender passions.

"There appeared in both sexes a greater degree of devotion than virtue, more religion than probity, a higher sense of honour than real honesty. Superstition took place of morality, which will always be the case, whenever men are taught to believe that ceremonies will compensate for good works, and that crimes are expiated by prayers."

Professor Kalm remarks (in 1757), "A girl of eighteen is reckoned to be poorly off if she cannot enumerate at least twenty lovers. These young ladies, especially those of a higher rank, get up at seven, and dress till nine, drinking their coffee at the same time. When a young fellow comes in, whether they be acquainted with him or not, they immediately lay aside their work, sit down by him, and begin to chat, laugh, joke, and invent *double entendres*, and this is reckoned being very witty. One of the first questions they propose to a stranger is, whether he is married; the next, how he likes the ladies of the country; and the third, whether he will take one home with him."

If these descriptions be correct, the Canadian ladies of that time were very different from those of the present day; for I believe them to be as modest and industrious as those of any country. They are, it is true, more affable, and have more freedom of manners than the English.

The superior intelligence of the women in the country parishes of Lower Canada is by all acknowledged. It is worthy, however, of remark, that, until within the last twenty years, scarcely any measure for promoting education in the country was carried into operation by the government; and the instruction of boys was consequently much neglected, as they could not well afford to attend seminaries at a distance from home. In respect to girls in the country, the case was very different. The Convent of the Sisters of the Congregation, established by Madame de Bourgeois, has for a long time provided schoolmistresses for from fifteen to twenty schools, in various parts of the province. In these schools, reading, writing, a little arithmetic, religious instruction, needlework, and such other knowledge as rendered the girls eminently useful in domestic management, were taught. The Canadian women, therefore, owe their superior intelligence to the good Sisters of the Congregation.—*Macgregor's British America*, vol. ii., page 341.

CHAPTER XXII.

CONQUEST OF CANADA.

SUCH was the condition of Canada, when the English government, exasperated by the massacre at Fort George, and animated by the surrender of Louisburg, resolved on subduing all the northern French possessions in America. It was, therefore, determined to conquer Canada by simultaneously attacking Quebec, Fort Niagara, and the forts at Ticonderago and Crown Point. To the army under General Wolfe, and the fleet under Admiral Saunders, was assigned the conquest of Quebec; to General Amherst, the commander-in-chief in America, the reduction of the forts at Crown Point and Ticonderago; and that of Niagara to General Prideaux, but which afterwards devolved on Sir William Johnson. The latter expeditions were afterwards to concentrate their forces with those under General Wolfe.

In the month of June, 1759, the English fleet sailed up the St. Lawrence to the island of Orleans, where Wolfe landed with an army of 8000. The French disposable forces, exclusive of the garrison of Quebec, consisted of about 10,000 men, with a reserve of 2000. Wolfe first attempted the entrenchments at Montmorency, landing his troops under cover of the fire from the ships of war; but he was gallantly repulsed by the French. After some delay, it was determined to effect a landing in order to carry the heights of Abraham, above Quebec. This daring resolution was effected on the 12th of September, with surprising secrecy and intrepidity.

The ships of war sailed nine miles up the river above Quebec to Cape Rouge. This feint deceived M. Bougainville, who, with his division of the French army, proceeded still further up along the banks of the river to prevent the British debarking. During the night, the English ships dropped down silently with the current to Wolfe's Cove, and at four o'clock in the morning the troops began to land. At eight the British army ascended the precipitous heights, with two field pieces in front; the 48th regiment and light infantry forming a reserve, and the Royal Americans covering the landing.

The Marquis de Montcalm, who was then at Beauport, marched across the St. Charles on the 13th, and imprudently formed in front of the British army with only one field piece, and before he could concentrate all his disposable forces. He then advanced most gallantly; but the scattered quick firing of his troops, which commenced within about 250 yards of the English line, was far from being so effective as that of the British. The latter moved forward regularly, firing

steadily, until within twenty or thirty yards of the enemy, when they gave a general volley, and the French were soon after routed. Bougainville had just then appeared in sight, but the fate of Canada was decreed—the critical moment was gone—and he retired to Point au Tremble, where he encamped: from thence he retreated, first to Three Rivers, and then to Montreal. There was also a body of French troops near Beauport, which were not engaged. Had all the forces been concentrated under Montcalm, it is doubtful if the heroism of the British troops could have secured the victory. The most extraordinary bravery was displayed both by the English and the French. Both armies lost their commanders. Wolfe expired with victory accompanying the close of his splendid career. At the age of thirty-five, when but few men begin even to appear on the theatre of great deeds, inheriting no family pretensions, and unassisted by faction or intrigue, he held a command of the highest responsibility, and with a truly unblemished character, fulfilled the most sanguine expectations of his country.

The Marquis de Montcalm, an officer of equal bravery, died of his wounds a few days after.* Quebec capitulated on the 18th to General Murray, who succeeded to the command. He, however, committed a most egregious blunder some time afterwards, by leaving Quebec to attack M. Levi, who was encamped with the French army at Sillery, and who completely defeated General Murray, and compelled him to retire within the walls of Quebec, with the loss of his artillery, and nearly one-third of his army.

The fort of Niagara was, in the mean time, reduced by Sir William Johnson, and the forts at Ticonderago and Crown Point, by General Amherst. They were consequently enabled to concentrate their forces, and form a junction with General Murray. Previously to this, on learning that the English fleet was in the St. Lawrence, and that the armament sent from France to relieve Quebec was captured in the Bay de Chaleur, by a squadron from Louisburg, under Captain Byron, the French forces retreated to Montreal, where the governor-general, M. de Vaudreuil, determined to make a desperate stand. Being, however, invested by the united forces of the three British generals, he found further resistance useless, and capitulated on the 8th of September, 1760, when Montreal, and all the French fortresses in Canada, were surrendered to Great Britain. The articles of capitulation under which Montreal surrendered were highly honourable to M. de Vaudreuil, who exacted, to the utmost that he could possibly expect to obtain, every advantage for the people he had previously

* A misunderstanding, it is well known, existed between the Governor-general M. de Vaudreuil and General Montcalm. The latter proposed a different plan of attack and defence from that resolved upon by the former, who, in council a few days before even expressed his doubts as to the courage of the Marquis de Montcalm, who in a spirit of wounded honour, immediately fought a precipitate battle, before concentrating the forces, within less than a day's march.

All the Canadians consider this circumstance, joined to the rapacity of the civil officers, who carried on a general system of pillage with the most audacious effrontery, as the causes which secured the easy conquest of Canada.

commanded. Three years afterwards France ceded to Spain, Louisiana, and all the French possessions on the Mississippi.

The battle gained by Wolfe on the heights of Abraham, formed a preliminary cause, which has already been attended with mighty consequences not contemplated at that period : those consequences themselves must again form successive causes of great effects. Had France retained the Canadas, British America would probably have continued for several years longer to be overawed into humble submission by England ; and the whole country of Upper Canada, of Michigan, and of the vast basins of the Ohio, Mississippi, and Missouri, would now, in all likelihood, be inhabited nearly altogether by people of French, and not, as to-day, chiefly of English race. Nor would there ever, in all probability, bet he least prospect of the whole continent, of at least North America, including probably Mexico, and not unlikely the central republics, becoming eventually Anglo-American nations, speaking the same language, and possessing the same literature, however numerous the sovereign states, or separate governments, may become.

CHAPTER XXIII.

CONDITION OF THE FRENCH CANADIANS ON THEIR BECOMING SUBJECT TO THE BRITISH CROWN.

HAVING described the French Acadians previous to, and after, their becoming British subjects, we consider it proper to give an account of the Canadians, of French race, who have remained under English allegiance.

For some time after the capitulation of Canada, no regard was paid to the French laws or courts. Military tribunals were instituted in the districts, from which appeals might be made from the commanding officer. General Murray carefully guarded against the abuse of power in such absolute courts.

Soon after the peace of 1763, which left to France no part of all her vast territories and power in North America. General Murray established new courts of civil and criminal jurisdiction, in which the laws of England were introduced, and continued in force until the year 1775.

The following extracts from a letter, written in 1765, by Governor Murray, to the Lords of Trade and Plantations, afford, it is believed, a just account of the state of the province at that period. " It consists," he states, " of 110 parishes, exclusive of the towns of Quebec and Montreal. These parishes contain 9722 houses, and 54,575 Christian souls ; they occupy, of arable land, 955,755 arpents. They sowed in the year 1765, 180,300½ minots of grain ; and that year they pos-

sessed 12,546 oxen; 22,724 cows; 15,039 young horned cattle; 27,064 sheep; 28,976 swine; and 13,757 horses; as appears by the annexed recapitulation, taken by his order, in the year 1765.

“The towns of Quebec and Montreal contain about 14,700 inhabitants. The savages, who are called Roman Catholics, being within the limits of the province, consist of 7400 souls, so that the whole, exclusive of the king's troops, amount to 76,275 souls; of which in the parishes are nineteen Protestant families; the rest of that persuasion (a few half-pay officers excepted), are traders, mechanics, and publicans, who reside in the lower towns of Quebec and Montreal. Most of them were followers of the army, of mean education, or soldiers disbanded at the reduction of the troops. All have their fortunes to make, and I fear few are solicitous about the means, when the end can be obtained. I report them to be in general, the most immoral collection of men I ever knew: of course, little calculated to make the new subjects enamoured with our laws, religion, and customs; and far less adapted to enforce those laws which are to govern them.

“On the other hand, the Canadians, accustomed to arbitrary, and a sort of military government, are a frugal, industrious, and moral race of men; who, from the just and mild treatment they met with from his majesty's military officers, who ruled the country for four years, until the establishment of civil government, had greatly got the better of the natural antipathy they had to their conquerors.

“They consist of a noblesse, who are numerous, and who pique themselves much upon the antiquity of their families, their own military glory, and that of their ancestors. These noblesse are seigneurs of the whole country; and, though not rich, are in a situation, in that plentiful part of the world, where money is scarce and luxury still unknown, to support their dignity. Their tenants, who pay only an annual quit rent of about a dollar for 100 acres, are at their ease and comfortable. They have been accustomed to respect and obey their noblesse; their tenures being military, in the feudal manner, they have shared with them the dangers of the field, and natural affection has been increased, in proportion to the calamities which have been common to both from the conquest of this country.

“As they have been taught to respect their superiors, and are not yet intoxicated with the abuse of liberty, they are shocked at the insults which their noblesse and the king's officers have received from the English traders and lawyers, since the civil government took place. It is natural to suppose they are zealous of their religion. They are very ignorant; it was the policy of the French government to keep them so; few or none can read. Printing was never permitted in Canada till we got possession of it. Their veneration for the priesthood is in proportion to their ignorance, it will probably decrease as they become enlightened, for the clergy there are of mean birth and very illiterate; and as they are

now debarred from supplies of ecclesiastics from France, that order of men will become more and more contemptible, provided they are not exposed to persecution.* Disorders and divisions, from the nature of things, could not be avoided in attempting to establish the civil government in Canada, agreeable to my instructions, while the same troops who conquered the country, for four years remained in it. They were commanded by an officer, who, by the civil establishment, had been deprived of the government of half the province, and who remained, in every respect, independent of that establishment. Magistrates were to be made, and juries to be composed, out of 450 contemptible settlers and traders. It is easy to conceive how the narrow ideas and ignorance of such men must offend any troops, more especially those who had so long governed them, and knew the means from which they were elevated. It would be very unreasonable to suppose that such men would not be intoxicated with the unexpected power put into their hands; and that they would not be eager to show how amply they possessed it. As there were no barracks in the country, the quartering of the troops furnished perpetual opportunities of displaying their importance and rancour. The Canadian noblesse were hated, because their birth and behaviour entitled them to respect; and the peasants were abhorred, because they were saved from the oppression they were threatened with. The presentment of the Grand Jury at Quebec puts the truth of these remarks beyond a doubt.† The silence of the king's servants to the governor's remonstrances, in consequence of their presentment, though his secretary was sent to them on purpose to expedite an explanation, contributed to encourage the disturbers of the peace.

"The improper choice and numbers of the civil officers sent out from England increased the inquietude of the colony. Instead of men of ingenious and untainted morals, the very reverse were appointed to the most important offices; and it was impossible to communicate, through them, those impressions of the dignity of government, by which alone mankind can be held together in society. The judge fixed upon to conciliate the minds of 75,600 foreigners to the laws and government of Great Britain, was taken from a gaol, entirely ignorant of civil law, and of the language of the people. The attorney-general, with regard to the language of the people, was not better qualified.

"The offices of the secretary of the province, registrar, clerk of the council, commissary of stores and provisions, provost-martial, &c., were given by patent

* This observation is the only one objectionable, on account of truth, in this able letter. I feel no fear in hazarding the assertion, that the Catholic clergy were not at that time illiterate, nor generally of low birth: and since that period, instead of becoming contemptible, they have become, with the growing intelligence of the world, more learned and respectable.

† The Protestant grand jury represented the Roman Catholics as a nuisance, on account of their religion. "Ils ont laissé beaucoup de successeurs, heritiers de ces sentimens," said a learned Canadian to me,

to men of interest in England, who let them out to the best bidders; and so little did they consider the capacity of their representatives, that not one of them understood the language of the natives. As no salary was annexed to these patent places, the value of them depended upon the fees, which, by my instructions, I was ordered to establish, equal to those of the richest ancient colony. This heavy tax, and the rapacity of the English lawyers, were severely felt by the poor Canadians; but they patiently submitted, and, though stimulated to dispute it by some of the licentious traders from New York, they cheerfully obeyed the Stamp Act, in hopes that their good behaviour would recommend them to the favour and protection of their sovereign.

“As the Council Book of the province, and likewise my answer to the complaints made against my administration, have been laid before your lordships, it is needless to presume to say any thing further on that subject, than that I glory in having been accused of warmth and firmness in protecting the king’s Canadian subjects, and of doing the utmost in my power to gain my royal master the affections of that brave, hardy people, whose emigration, if ever it should happen, will be an irreparable loss to their empire; to prevent which, I declare to your lordships, I would cheerfully submit to greater calumnies and indignities (if greater can be devised) than hitherto I have undergone.”*

CHAPTER XXIV.

PRESENT CONDITION AND CHARACTER OF.—CANADIANS OF FRENCH ORIGIN.

THE condition, manners, habits, and pursuits, of the Canadians of French origin, resemble, at the present time, many of the characteristics described by Governor Murray. While residing in that country, and travelling among the settlements which they inhabited from Beauharnois down to Rimouski; an extent of 300 miles along the southern shores of the St. Lawrence; and on the north from the Ottawa, and upper point of Montreal, down to three rivers, Quebec, Beaufort, and the Isle of Orleans, we have examined with great care the condition, character, and disposition of an interesting people, who have been, unfortunately, but imperfectly known, or understood, in England. The following description which we have written from personal observation, applies to the settlements generally on the south shores of the St. Lawrence, and to those on the north banks between Quebec and Montreal:—

* “Rien de plus vrai et de plus exact que les observations du Général Murray, sur les affaires du Canada après la conquête,” said a highly-talented Canadian gentleman to me, on reading this letter.

The villages and parishes have a great similarity of appearance, and although some of them are more extensive, and much more populous than others, yet one description is sufficient for all. We cannot but be pleased and happy while travelling through them. They assuredly seem to be the very abodes of simplicity, virtue, and happiness. We pass along delighted through a beautiful rural country, with clumps of wood interspersed amidst cultivated farms, pastures, and herds, decent parish churches, and neat white houses or cottages. The inhabitants are always not only civil, but polite and hospitable, and the absence of beggary, and of the squalid beings whose misery harrows our feelings in the United Kingdom, is the best proof that they are in comfortable circumstances. Thefts are rare, and doors are rarely locked. You never meet a Canadian but he puts his hand to his hat or *bonnet rouge*, and he is always ready to inform you or to receive you into his house, and if you be hungry, the best he has is at your service.

The manners of the women and children have nothing of the awkward bashfulness which prevails among the peasants of Scotland, nor the boorish rudeness of those of England. While we know that each may be equally correct in heart, yet we cannot help being pleased with the manners that smooth our journeys; and often have we compared the easy obliging manners of the Canadian habitants, with the rough 'What d'ye want?' of the English boor, or the wondering 'What's your wull?' of the Scotch cotters.

At the inns or *auberges*, many of which are post-houses, we find civility, ready attendance, and have seldom to complain of what we pay for. In travelling we now and then meet a cross erected at the side of the road, on a spot to which some trifling legend is attached. In some places we see large plaster casts of the Crucifixion, under a wooden canopy, supported by four tall posts. I observed one of these in the middle of a marsh, near the post-road below Kamouraska.

The house of a captain of militia is always distinguished by a tall flag-staff near it, painted red, or with circles of white, red, blue, or black.

The priest's house is always close to the church, and you never see him except in sacerdotal robe. Enter his house and you are welcome, nor will he let you depart hungry.

The parish church, with a pretty bright tinned spire, and sometimes with two, is a striking characteristic feature which occurs at intervals of from four to eight miles along the banks of the St Lawrence.

The houses of the habitants are sometimes built of stone, but generally of wood, and only one story high.

The walls outside are whitewashed, which imparts to them, particularly in summer, when almost every thing else is green, a most lively and clean-looking appearance. Each contains a large kitchen, one good sitting-room, and as many sleeping or bed-rooms as may be judged requisite. The garret is generally used

for lumber and seldom for bed places. Some of the houses have verandas, and a small orchard and garden attached; near the house there is always a clay-built bake oven and a well, from the latter the water is drawn by means of a lever. The elevation and ground plan of a family house are generally the same as the following outlines:—The sitting-room or parlour, and bed-rooms, are lined with smoothly-planed boards, and painted with blue, red, green, yellow, &c., and according to our ideas, in very bad taste; but according to *Jean Baptiste's** fancy, very fine and pretty; and why not, if he be happy in the idea? Wax and brass images of the Virgin and Child, or the Crucifixion; and pictures of grim saints, the Madonna and Child, &c., all of the cheapest and most common kind, are hung round the room; and one middle-sized and several common looking-glasses, and a common clock are seldom wanting. Sometimes we observe a looking-glass picture, which, from their curious wrought frames must be from one to two hundred years old. There is also one or more cupboards or buffets in the room, which exhibit common glasses, decanters, cups and saucers, &c., and generally a large punchbowl, for the purpose usually of making egg† or milk punch.

The geese raised on their farms afford sufficient feathers for beds; and the habitants are never without them. Their sheets and blankets are rather coarse, but manufactured by themselves of the fleeces of their sheep, and of the flax they cultivate.

The barns and cattle-houses are plain oblong buildings. The farms run parallel with each other: pole-fences occasionally separate them, and from ten to seventy arpents of each are cleared and cultivated. The post-road runs across them all, and each habitant keeps his own portion in repair.

The parish of St. Thomas, on the Rivière de Sud, is one of the most populous below Quebec. The river flows from the south, through a beautiful, extensive, fertile, and rather thickly-settled country, and rolls over a ledge of rocks, twenty feet high, into the St. Lawrence. It has several excellent bridges over it; and along its banks are many of the best cultivated farms in Lower Canada. In the rear of the village, Chapel Hill, a pretty eminence, rises, amidst fertile fields.

In the village there is a handsome, though plain, stone church, said to contain near 3000 persons. We had the opportunity of being at this church on a Sunday. Nothing could be more pleasing than the scene which presented itself. It was on a delightful, calm, summer morning; the meadows, corn-fields, and woods, were as richly decked as imagination could well fancy, and the surrounding scenery as interesting as a picturesque tourist could even wish. The

* Jean Baptiste is as frequently a *nom de guerre* for Canadian habitants, as John Bull is for the English, or Saunders for the Scotch.

† Egg punch, or egg nog, consists of eggs and sugar beat up together, to which is added a little milk or water, and as much spirits as will be equal to a quarter of the whole. This is a common treat among the Canadians.

whole creation was wrapt up in peaceful, but not solemn, stillness; for the lively verdure of the country, thickly decked with neat white cottages, and the smooth flowing beauty of the St. Lawrence, with several tall ships carried along by the tide, banished every impression except those of the most happy admiration, while the spirits were just raised to that pitch of cheerfulness, in which neither volatility nor gloom has any share.

About ten o'clock, the roads leading through this extensive parish exhibited a decently-dressed peasantry, clad chiefly in fabrics manufactured by themselves, of the wool, flax, leather, and straw, produced on their farms. A great multitude moved on, with a sober trot, in *calèches* and *cabriolets*; several on horseback, and others on foot; but no one disturbed the calm tenor of the day, further than casual converse between two or three.

In church, if the most close and devout attention during the whole service of mass, and the delivery of a short, practical, but not argumentative, sermon, which dwelt altogether on their moral conduct, without alluding to points of faith, be considered as general proofs of sincerity and piety, the habitants of this parish have undeniable claims to these virtues. We believe there is little difference to be found, in this respect, among the other parishes. If there be, we have failed to discover it: and admitting, as we have frequently heard, that they are religious by habit and imitation, rather than by conviction, no one who has travelled among them can deny that they are sincere, amiable, charitable, honest, and chaste. Let us leave abstract points of Christian doctrine to theological disputants; but if we look for a more correct or moral people than the Canadian habitants, we may search in vain. A Sabbath morning in the Scotch parishes most remote from towns, bears the nearest resemblance to a Sunday, before mass, in Canada.

The interval, however, between morning and evening service, differs, but not widely; for, in both countries, those who do not return to their houses, spend the time in conversing on local incidents, or in communicating what news is gathered during the week. But the evenings of Sunday are far more cheerfully spent than in Scotland. The people of the parish often meet in small groups, or at each other's houses, for the sake of talking, and on these occasions they sometimes indulge in dancing.

We may always observe beings kneeling along the aisles, or beside the columns, with their faces towards the altar; and as we pass along, we hear the half-smothered breathing of their devotions. At such a time, rather than during the pompous celebration of high mass, few, we believe, have ever found themselves within the walls of a spacious Catholic cathedral, that have not experienced a deeper feeling of reverence, and a more impressive consciousness of the presence of Omnipotence, than is usually experienced within the temples of Protestantism. This, we know, is not philosophy—but it is nature.

On Easter Sunday, and on some other feasts, especially the Fête Dieu, this Cathedral of Montreal exhibits ceremonies and solemnities widely different from the calm spirit of devotion that prevails on week days. The bishop, and sometimes twenty priests, officiate during the celebration of high mass. The pompous procession; the chiming of the bells; and, in the cathedral, the loud solemn tones of the organ; the kneeling crowds; the silver censers; the incense; the splendour which surrounds the altar; and all the other various accompaniments of this high celebration, are infinitely more imposing than any religious ceremony to be witnessed in these days in England.

The education of youth was long neglected in Canada. Among the habitants, it does not appear that the clergy, during the French government, encouraged learning, although they did not at the same time discourage education, otherwise than by the example which their indifference taught. At that time the priests were chiefly born and educated in France. Few of the habitants who have passed the middle age of life can read or write—the women were more frequently taught both than the men. This arose from the extinction of the male religious fraternities, particularly the Jesuits; while the nunneries were not disturbed by the British government, and the sisters and nuns in these nunneries have always given their attention to the instruction of young girls.

As they applied their means, and devoted so great a portion of their lives to the useful instruction of mankind, however pernicious to liberty may have been the principles laid down in the secret institute of their order, it was expected by the Canadians that the revenues arising from the lands that belonged to the Jesuits would be appropriated in aid of public instruction, after these revenues were possessed by the crown.

The priests, who are now the only ecclesiastics in Canada, were formerly only second to the Jesuits, and seldom troubled their heads about giving more instruction to the people than was comprehended in the service and ceremonials of the church; but their influence and example, although injurious as affecting mental improvement, was certainly beneficial in respect to morals.

The Récollets were the lowest religious order in Canada; they made vows of perpetual poverty, and were, it seems, little esteemed by the Jesuits.

The Canadians had a proverb—"Pour faire un Récollet il faut une hache, pour un prêtre un ciseau; mais pour faire un Jesuite il faut un pinceau."

To the Catholic priests of the present day in Canada, justice requires us to acknowledge that there is great merit due. Although, generally speaking, their education and attainments do not, perhaps, exhibit the splendid points of acquirement in polite literature, and in the sciences, which distinguished the Jesuits; yet they neither want intelligence, nor are they destitute of useful or classical learning. Many of them are eloquent preachers; and it is worthy of our consideration to know, that since the Catholic clergy have consisted nearly all of Ca-

nadians, born in the province, and have themselves received their education in the colleges of Canada, they have directed their special attention to the instruction of youth.*

They have been accused of silently opposing the establishing of schools, and the instruction of the Canadian youth, particularly in the English language. No charge can now be more unjust. Disputed points of faith do not belong to our province; and having known many of the Canadian priests, truth and candour require us to declare, that they are pious and amiable; and not only watch carefully, over the morals of their parishioners, but conduct themselves as individuals, and as a body, with praiseworthy correctness. They certainly never give any advice to others, that the example of their own conduct does not enforce. Many of the schools have been established by the curés.

There is not, probably, in the world a more happy people than the *habitans*, or peasantry of Lower Canada. They are, with few exceptions, in easy circumstances; and in all the villages, the church forms the point around which the inhabitants, born in the parish, delight to live; and in no dwelling further from it than they can hear the ringing of its bell, can any of them feel happy. They are not anxious to become rich, but they possess the necessary comforts, and many of the luxuries of life.

They are frugal, but not enterprising, and will seldom buy what they can make themselves. Their lands yield them grain and vegetables, and food for their horses, cattle, sheep, hogs, and poultry, as well as hemp, flax, and tobacco.

They make coarse linen and woollen clothes, straw hats, worsted bonnets or caps, soap, candles, sugar,† and implements of husbandry. What they manufacture is seldom for sale, but for consumption. They have, in fact, every article of real utility—every necessary resource within themselves, no penury, no uneasiness, no distress is visible. Their mode of agriculture is clumsy and tardy; yet the soil, with the most negligent culture, yields abundance for domestic consumption, and something over seigniorial dues and the tithes, to sell, for the purchase of articles of convenience and luxury. Their farms are generally small, and often subdivided among a family. The agricultural societies may gradually improve husbandry among the *habitans*; but, hitherto, neither

* At the *Rivières des Trois* lived, and (in 1823), nearly eighty years old, died, the venerable, amiable, and accomplished Abbé de Calonne, brother of the famous financier and minister of Louis XVI. The revolution drove him from France to England. He then sought and found an asylum in Prince Edward Island, which he left for Canada: a colony whose inhabitants were more agreeable to the associations of his life and education. The world for him had lost its fascinations; for when the Bourbons reascended the throne of France, he not only became possessed of considerable property, but he had offers to return to his native country, that ambition would not have rejected. The property he at once distributed among others; and his little cure at Point du Lac, near Three Rivers, satisfied his ambition as to ecclesiastical power.

† Maple sugar. The season of manufacturing it is considered a period of pleasure rather than of fatigue, although it is attended with considerable labour. About 2,000,000 lbs. used to be manufactured in the province by the Canadians.

example, nor the prospect of interest has been sufficient to induce many to adopt the more approved modes of husbandry, or any of the methods of shortening labour, discovered during the last or present century. They have gardens attached to their houses, but the neatness and order which lend such charms to every little English cottage, is not to be found in the Canadian parishes. The women generally do all the garden work, and, like those of Normandy and Picardy, greatly assist in field labour. The occupations of the Canadians are neither severe nor incessant; as moderate industry secures all necessities. They, however, plough a great portion of their lands in autumn, and there is little doubt, but they will gradually change their mode of culture. We discover among the Canadians the customs and manners that prevailed among the peasantry of France during the age of Louis XIV.; and, to this day, the most rigid adherence to national customs is maintained among them. Contented to tread the path beaten by their forefathers, they, in the same manner, till the ground: commit, in the like way, the same kind of seeds to the earth; and in a similar mode do they gather their harvest, feed their cattle, and prepare and cook their victuals. They rise, eat, and sleep, at the same hours; and under the instruction of their pastors, and the example of their elders, observe the same spirit in their devotions, with as ample a portion of all the forms of the Catholic religion, as their ancestors.

They are fond of soups, which are seldom, even in Lent, of meagre quality. Bread, butter, cheese, with eggs, tea, poultry, fish, and flesh, constitute nearly all the other articles of their food. They have their *jours gras*, or feasting days, before and after Lent, on which they gormandise vast quantities of animal food, and indulge in drinking; but on other occasions they are temperate.

The amusements of former times are also common among them: especially at their weddings, feasts, and dances. Even the noisy, tumultuous *charivari** is not entirely forgotten.

They delight in driving about in *calèches* and *carioles*. To the harness of their horses they hang numerous bells, and on passing each other always, as in France, take the contrary side of the road to that which we are accustomed to in England. Dancing, fiddling, and singing, are among their amusements after vespers on Sunday: considering it no sin but a harmless recreation, never attended with dissipation or vice. Sunday is, indeed, the happiest day in a Canadian's week. The parish church collects all acquaintances. The young and old, men and women, drive thither in their *calèches* in summer, and in their well-furred *carioles* in

* The *charivari* is a noisy assemblage of people, who proceed after bed-time to the house of a newly-married couple, whenever there is a flagrant inconsistency in the match: such as a young girl marrying an old man for his money, or *vice versa*. Some come on horseback, some blow horns, some beat drums and tin kettles; the English in the towns also join the *charivari*; others ring bells, shout, and swing rattles, continuing the *charivari* from night to night, until they receive a stipulated sum from the unhappy pair, for some charitable purpose.

winter ; there they meet for devotion, pleasure, and love. Even on their little matters of business they consider it innocent to converse after dinner.

Sunday is, therefore, truly a day of happiness in a Canadian parish. Their devotion is to them a pleasure. The *habitan* is sincerely pious ; and let him be taken where he may, if deprived of joining in the observances of religion, he is unhappy, superstitious, and fearful. This powerful feeling prevents him from going forth, like the American, with his family to settle, apart from all others, in the wilds.

Politeness seems natural to the Canadians. Habit, imitation, and temperament have made them a courteous people ; and the first thing a child learns is to say his prayers, to speak decorously and respectfully to every body, and to bow or courtesy to its elders and to all strangers. The *habitans* never meet one another without putting a hand to the hat or bonnet, or moving the head. Men and women are civil to all, not for mere form, or appearance, but from a sense of propriety ; and they always treat their superiors and parents with deference. Parents and children live frequently in one house to the third generation. They are exceedingly modest,—the women from the natural delicacy and disposition of their sex ; the men from custom and a full sense of decency ; the latter, in the country parishes, never bathe in the rivers, nor even in the most private places without being partially covered. The men are well proportioned, about, but something smaller than the middle size, and very rarely corpulent. From exposure to the climate their complexions are dark ; the sun in summer, and the snow in winter, bronze their faces, and the general use of close iron stoves may also affect their colour. The features of their faces are characteristic. The nose is usually prominent, and often aquiline ; the eyes dark, rather small, and remarkably lively ; the lips thin, chin sharp and projecting, and the cheeks inclining to lankness.

Many of the girls are pretty oval-faced brunettes, with fine eyes, good teeth, and glossy locks. They make affectionate wives and tender mothers. Their feelings are keen and their attachments ardent. They are generally more intelligent than the men ; and a *habitan* rarely enters upon matters of any importance without saying “ J’en parlerai à ma femme ; ” and on consulting his wife, but not before, will he conclude a bargain. On entering the house of a Canadian, his wife seems to anticipate our very wishes. If they have not at the time what we want, the landlady regrets it with such good grace that we cannot fail to be delighted with what she gives us.

The *habitans* marry young ; sometimes twenty couple are joined in wedlock at one time in the same church. They hate being alone. The world is nothing to them unless a number of families have the opportunity of assembling together. How very different from the Americans, among whom a man and his wife will leave a populous settlement, in which they were born, and all their friends

and relations without apparent regret, and plant themselves, regardless of all the human race, amidst the solitary gloom of the darkest forest !

A dance and feast always attends a wedding. The Canadian dances with all his heart ; and eats with all his vigour. On the day of a marriage, several calèches, or, if in winter, carioles, filled with friends and acquaintances, form a cortege of imposing appearance. On these occasions, the gayest colours, the best dresses, the most spirited horses, and most fanciful calèches, or carioles, are brought into full display, and often continued for several days.

The priests, by their admonitions restrain, to a certain degree, and more effectually than sumptuary laws ever could, the dress of the *habitans*.

In winter, the men are clothed in long full-skirted dark grey coats (*capots*) buttoned close to the body, with a hood attached, to draw over the head, and with a many coloured sash, frequently ornamented with beads round the middle ; and in pantaloons, *bonnet rouge*, or *bonnet bleu*, and *mocassins*, and never without a pipe in their mouths. In summer, light short jackets and straw hats, are worn in place of the long coats and *bonnet rouge*. The dress of the women is old fashioned, even when they wear gowns. Petticoats and short jackets, or bed-gowns, long waists, neat white caps, and, in summer, straw bonnets form the prevailing dress. In towns, the modern English or French fashions prevail.

The Canadian gentry all over the province, consisting chiefly of the descendants of the old noblesse and gentry, retain the courteous urbanity of the French school of the last century. After the conquest, the society of the French families of education and respectability who remained, was eminently courteous and polite ; and they were anxious to secure the good feeling of the early English settlers, by inviting them to share in the hospitality, pleasures, and amusements of their houses and of their society. (“ Une société dans laquelle régnoit généralement une politesse et une brillante urbanité.”) Canadian families of education, speak French as correctly as it is spoken in Paris. Many of them, also, converse fluently in English ; and although their disposition has been, and is, kind, and their manners agreeable, their society has not been sufficiently appreciated by the English.

The cultivation of the soil, building their houses, attending to their live stock, providing fuel, and making implements of agriculture, and articles of convenience, form the leading occupation of the rural Canadians. Fishing is rather an amusement, than a laborious pursuit. Spear fishing, with torch light, in calm summer nights, along the shores of the rivers, conveys something peculiarly striking to the observer. The light canoes that bear the torches and the spear-men over the surface of the smooth, limpid waters, follow in succession, each exhibiting a beautiful bright light.

Those of Anglo-Saxon race, who navigate the long craft, called Durham boats,

are very different beings from the Canadian boatmen who man the river boats, or *bateaux*. The former are generally tall, lank fellows, seldom without an immense quid of tobacco in their mouths: grave-tempered schemers, yet vulgar and seldom cheerful; "grinning horribly," when they venture an attempt to laugh.

The Canadian boatman, or *voyageur*, is naturally polite, and always cheerful; fond enough of money when he once possesses it, although unacquainted with over-reaching; and if he attempts to cheat, he knows not how. He sings, smokes, and enjoys whatever comes in his way, thanking "*le bon Dieu, la Vierge et les Saints*," for every thing.

The *voyageurs* know every channel, rapid, rock, and shoal, in the rivers they navigate; and, never pretending to question their leader, or *bourgeois*, fearlessly expose themselves to the greatest hardships, and the most frightful dangers.

When singing their celebrated boat-songs, two usually begin, two others respond, and then all join in full chorus. These songs make them forget their labours, and enliven their long and perilous voyages. Nothing can be more imposing than a fleet of *white canoes*, and the *voyageurs* all singing "cheerily," while paddling over the bosom of a lake, or along the sylvan shores of the St. Lawrence or Ottawa.*

The inhabitants of Normandy and Picardy,—from which parts of France the ancestry of the Canadian *habitans* chiefly emigrated,—are those whom the latter resemble most in their morals, customs, and dwellings. But the peasantry of Normandy and Picardy have changed many of their habits and customs, while the Canadians have retained them.

Crimes are very rare among the *habitans*. Honesty, chastity, piety, and superstition,—the latter not more common, however, than in Scotland and Ireland,—are prominent in the Canadian character. Perhaps no people on earth have enjoyed more happiness in their circumstances, joined to so much virtue in their lives, than the rural population of French origin in Canada, until they were duped by political adventurers to join in a rebellion against a government, which, though it may have frequently erred, had always considered the new subjects of the British crown as justly entitled to the full paternal and equal protection of its administration. We shall, hereafter, in our historical notice of Canada under the British government, point out the real causes of difficulty in the administration of that most important province.

* The white canoe of the North American Indians, is beautifully constructed, by sewing the rind of a huge white-birch tree over a slender frame work. On the water, this fragile vessel floats gracefully; and the long voyages of the Canadian fur traders, and those of Sir Alexander Mackenzie, to the Arctic Sea, and across the continent to the Pacific, were made in them. They are so light, as to be easily carried over land, by two men, from one river, or lake, to another.

BOOK II.

BRITISH AMERICA.

CHAPTER I.

ENGLISH VOYAGERS TO AMERICA.

THE Spaniards having, by early discovery, force, injustice, cruelty, and treachery, conquered the richest countries of America, the English had either to make new discoveries, or remain contented with their possessions in Europe.

Neither the ambition nor pride of England, nor the avarice of Henry VII., had sufficiently aroused the spirit of adventure to induce, either the people or the monarch, to undertake maritime discoveries, until after the Portuguese had explored the whole coast from Tangiers to the southern limits of Africa, and until the island, and the gold and silver treasures, of Hayti were seized by Spain.

Henry VII., in the year 1495, granted to John Cabot, a Venetian, and his sons, a commission to navigate, with five ships, at their own expense, all parts of the ocean, for the purpose of discovering islands and countries, "either of Gentiles or of Infidels, which had hitherto been unknown to all Christian people; and to take possession of, and to set up his standard in the same, as vassals of the crown of England; and to return with merchandise to the port of Bristol." It is maintained that the first voyage which Sebastian Cabot had made with his father to America, was in 1494, before the date of his commission; and that this date is in accordance with an extract from a map drawn by him and afterwards engraved, as stated by Hakluyt. They sailed from Bristol with one or more vessels, discovered Newfoundland, which he called *Prima Vista*, on the 24th of June. In 1497, John Cabot died, and his son, under a new patent from Henry VII., sailed with a large ship, fitted at the king's expense, from Bristol, accompanied by others, to discover a north-west passage to India; and after making the coast of Labrador, he is said to have sailed north to 67 deg.

30 min. N. latitude,* and then south, exploring the coast of North America to latitude 38 deg. N. That country, after the discovery of its more southerly parts, in 1512, by Ponce de Leon, was called Florida. Cabot, not being able to procure provisions from the natives, his crews, who had manifested a disposition to mutiny, when he was in search of the north-west passage, became dissatisfied, and he was compelled to return to England, which he did by way of Newfoundland. If the accounts of Sebastian Cabot's voyage be true, as authenticated by Hakluyt, Peter Martyr, Lopez, Ramusio, and several French writers, he was the first discoverer of all the countries on the Atlantic coasts, from Florida to the northern parts of Labrador. It is even probable that he discovered the continent of America before Columbus actually did so in 1498. But there is great obscurity as to the exact dates of the voyages of Cabot: for he either kept no journal, which is not probable, or his journal has not been found.

On his return to England, he met with no further encouragement from Henry VII., who was then engaged in war against the Scotch. That monarch completely forsook Cabot, and neglected making any further discovery. It would appear, from different accounts, that Cabot made several voyages afterwards, and that he visited the coasts of America, and entered the Gulf of St. Lawrence in 1502. But meeting with no encouragement from the crown, he went to Spain and was employed by the king to explore the southern part of Brazil. He sailed up the Rio-de-la-Plata, built a fort, and returned to Spain: where Charles V. treated him as ungratefully, as he had done all the previous discoverers employed by Spain.

We find that before 1516, Cabot returned to England,† and departed that year on a voyage, of which we have but a very imperfect account in a frigate fitted out by Henry VIII., and sailed to the coast of Brazil, from which he returned by way of Hayti and Porto Rico. He was afterwards honoured (in 1581) by Edward VI. conferring on him the title of Grand Pilot of England with an annual fee or salary of 166*l.* 13*s.* 4*d.*, a large amount at that period. In 1557, we find that he was Governor of the Company of Merchant Adventurers for making discoveries; under which was fitted out the expedition for finding a north-east passage to China, under Sir Hugh Willoughby, and which ended by the latter, with the crew of his own ship, being frozen to death; and by Chancellor, who commanded one of the other vessels, discovering the White Sea, and the port of Archangel. Cabot must have been nearly eighty years of age, when he drew up the admirable instructions given by him to Sir Hugh Willoughby; and to Cabot

* Hakluyt and Purchas, quoting from the Preface to the 3rd volume of Ramusio's Voyages. That Cabot sailed so far north is not probable, and in the third edition of Ramusio, printed at Venice, it is stated, vol. iii., page 870, that Sebastian Cabot reached *cinquanta-sei grade sotto*, &c.

† He built a handsome mansion near Blackwall, which he called Poplar, and which name though the house disappeared more than a century ago, is still applied to the district behind Blackwall and the West India Docks.—See "Eden's Book," published in 1553; which book or collection, led to Mr. Hakluyt's celebrated "Collation of Voyages."

we must allow the merit of arousing the spirit of adventure which animated many Englishmen, and especially British seamen, about this period, and which brought forth the Drakes, Hawkins, Dampiers, and other bold mariners. During the reign of Queen Mary, and especially after her marriage with Philip of Spain, adventures by sea, which might cause the jealousy of, or in any way approach, the countries in America, conquered or claimed by Spain, was discouraged. The trade to the north of Europe, the Mediterranean, and to Africa, was, however, countenanced by her ministers; and, in the reign of Queen Elizabeth, every encouragement was given to, and the most honourable distinctions conferred on, her naval commanders. From this period England became a great maritime power, and her ships proceeded to all the sea-coasts of the world. The ignominy of carrying slaves from Africa to America was caused by the English, in the reign of Queen Elizabeth.

In 1578, Martin Frobisher sailed to discover a north-west passage, and reached Labrador. Drake, and many other daring navigators of that period, can scarcely be considered in a more favourable character than that of bold and successful pirates; nor even the merchants who engaged in the early voyages to Africa, the West Indies, and coasts of South America, otherwise than as an association of robbers; plunder, or the slave-trade being invariably the chief objects of these expeditions. Sir Francis Drake, in 1580-81, was the second circumnavigator of the globe, which voyage was also accomplished, a few years afterwards, by Cavendish; and the trade round the Cape of Good Hope to India, was opened by the English in 1601.

As early as 1534, Jacques Cartier, of St. Maloes, sailed from France, on a voyage of discovery, and entered the Gulf of St. Lawrence, on the festival of that saint, to which that Mediterranean Sea owes its name. The following year he sailed up the great *Hachelaga*, which he called the St. Lawrence, and wintered in Canada, of which he took the usual formal possession for his sovereign, and named the territory New France.

CHAPTER II.

ATTEMPT TO COLONISE VIRGINIA—SIR WALTER RALEIGH

WITH the exception of the fisheries on the banks and coasts of Newfoundland, the countries discovered by Cabot from 1497 to 1502, were entirely neglected until 1579; when the first attempts at settlements, by the English, were made by Sir Humphrey Gilbert, who had obtained a patent from Queen Elizabeth to plant Newfoundland, and those parts of America discovered by Se-

bastian Cabot. Gilbert was half-brother to Raleigh, and had distinguished himself in France and Ireland. But he was unsuccessful in his first voyage. The rocky, dark, and inhospitable aspect of the coasts of Newfoundland and Cape Breton, seems to have terrified his people; and he returned home, after losing one of his ships. He made a second attempt the following year, and the ship he was in, and all on board perished, through ignorance, or imprudence.

One of the most spirited, gallant, and accomplished men, that any age or country has given birth to, appeared at this time, as the enthusiastic promoter of navigation, commerce, discovery, and colonisation. This remarkable personage was Walter Raleigh. He was born at Hadleigh, in Devonshire, in 1552, in a house called *Hays*, which had long been the patrimony of his family. His early education does not appear to have been complete: even in the obscure range of instruction then taught at the grammar schools, or at Oxford, where he had been for some time at Oriel College. At one of the inns of court, he studied law with close application; but not for a long time: for he became, at the age of seventeen, one of the volunteers who went to assist the Queen of Navarre and the Huguenots, in France; where, during four years of battles, sieges, and negotiations, he was distinguished for his brilliant actions, and for his honourable conduct. He afterwards served, with reputation, in Holland; and, on returning, in his twenty-seventh year, he accompanied his relative, Sir Humphrey Gilbert, on his first unsuccessful voyage. From that period he directed his mind and studies to maritime discovery and colonisation. Being early convinced of his imperfect education, he had for years, while engaged in his military and maritime duties, studied four hours out of the twenty-four, and allowed himself but five hours for sleep. He never was known to shrink from the same labours, or fatigues, to which the humblest of his companions were subjected. He served afterwards with distinction in Ireland, and soon became a favourite with Queen Elizabeth.

Florida was discovered, in 1498, by Cabot. The Spaniards, who visited the country, gave it that name by which the whole of that part of America, and the coast to an indefinite distance northward, was known until 1584, when Sir Walter Raleigh and Adrian Gilbert obtained a second patent from Queen Elizabeth, by virtue of which they took possession of the country called Virginia. This was long the name by which the English designated all North America; and was so called, by the courtly Raleigh, in honour of the unmarried sovereign of England. The enthusiastic ardour of Sir Walter was not to be frustrated by the unfortunate calamity which befel Sir Humphrey Gilbert; and two vessels were despatched by him in 1584, under the command of Captains Amadas and Barlow; they discovered Roanoake; established a friendly intercourse with the natives; and, on their return, gave a flattering description of the country, and of the people, two of whom accompanied the expedition back to England.

The first planting of a settlement by the English was, in 1585, at Roanoake, in Virginia: one hundred and eight settlers were sent there during that year by Raleigh, in order to found a colony. They were accompanied by a Captain Lane and Captain Amadas, and by Heriot, the improver of algebraic calculation. But the predatory conduct of Sir Richard Grenville, who commanded the expedition, created an impatient spirit, very unfit for colonisation, among the people he landed in Virginia. Grenville has been extolled for heroism and brilliant exploits, in an age, when most of our naval commanders were, in reality, only bold corsairs. He commanded seven ships, which, exclusive of the colonists, who embarked for Virginia, were strongly equipped. Instead of sailing direct for Roanoake, he steered for the West Indies, in order to cruise among the islands, and intercept and capture Spanish ships. All on board the ships, including the colonists, were soon infected with the spirit of the commander. After committing depredations, and making captures, he finally, instead of primarily, landed the colonists to shift for themselves in Virginia. They disliked labour, became discontented on not finding gold; and exhausted their provisions and resources, in a vain search after the precious metals. They quarrelled with the natives, and bloodshed was the consequence. Many of the colonists perished, and the remainder, disheartened, or unable to maintain their ground, returned to England with Sir Francis Drake, who had then visited the colony. Such was the fate of the second attempt at settlement on the part of England. A few days after their departure, a small vessel despatched by Raleigh, arrived with supplies; but finding the place abandoned, returned to England.

Sir Richard Grenville was sent out, a second time, by the persevering Raleigh, and arrived at Roanoake with three ships, and abundant supplies, a fortnight after the departure of Drake with the colonists. He left fifty men there to establish themselves in the deserted settlement. Sir Walter, impatient of delay, sailed a little before in a separate vessel, and made the coast near Cape Hatteras; but not being able to find Roanoake, returned to England. In 1587, Sir Walter Raleigh sent out a ship with settlers, under the charge of Governor White. When the latter arrived in Virginia, he found that either famine or the savages had destroyed the whole of Grenville's colony. Governor White left 175 men and women in Virginia, well provided with all necessaries; and, before his departure, an Indian, named Manteo, embraced Christianity. On the 18th of August, that year, Mrs. Dare gave birth to a daughter, christened Virginia. This unfortunate child was the first born of English parents in America.

When White had returned, in 1587, he found England engaged in preparing for defending the country against the great Spanish Armada. Sir Walter Raleigh was among those most actively engaged in these preparations. He had not, however, forgotten his Virginian colony; and he equipped a small squadron, under the command of Grenville, to proceed with settlers, provisions, and other

necessaries to Roanoke. These vessels were detained by Queen Elizabeth, as necessary for the national defence. White sailed with two small vessels, with which he attempted to take some Spanish vessels, but was defeated, disabled, and compelled to return to England. He returned to Virginia in 1590, and found the whole colony exterminated. The latter fruitless expedition was not directed by Raleigh, but by Sir Thomas Smith and some London associates, to whom Sir Walter had assigned his patent. So disheartening and unsuccessful were the attempts to settle the country, that in 1602, that is, 244 years ago, there was not an European in all North America. To the detention of the ships placed by Raleigh under Grenville, may be attributed the destruction of the settlement, founded in 1587.

De Monts, from St. Maloes, established, in 1604, a small colony at Port Royal, Acadia (now Annapolis, Nova Scotia). This was the first permanent European settlement in North America.

Raleigh, though he ceased, in consequence of his multifarious duties, to have any direct connexion with the expeditions to America, which, without returning the smallest return, had subjected him to a personal expense of more than 40,000*l.*, still hoped that permanent settlements would be established by the new association of commercial adventurers. He accordingly transferred his patent to Sir Thomas Smith, without any other consideration than that he would establish and maintain a trade between England and America; and that if gold and silver were afterwards found, that he should receive a share. But he had transferred his rights to men who were influenced by a very different spirit to that which guided and animated him, in fitting out expeditions that had drawn so largely on his personal fortunes. The queen had conferred on him, before assigning his patent, arduous labours in Ireland, as well as a district, in that country, to people and improve. He was engaged also in attempting a scheme for the conduct and expense of an armament to re-establish Don Antonio in Portugal. These duties, with others, and the projecting of his last, and generally considered, most wild and visionary expedition, that for the discovery of an El Dorado, in Guiana, fully occupied his time.

The fortunes of Raleigh were ruined after the death of Queen Elizabeth; and by the accession to the crown of a despicable, and, almost in every meaning of the term, a bad monarch, and pedantic, mean, and selfish man. James I., was peaceful, as a king, from moral cowardice—vain of the obscure learning of the schools, which scarcely comprised any knowledge of the arts or sciences: proud of being told by the flatterers, who despised and duped him, that he was the most wise and potent of princes; and jealous of the prerogatives, which he most unconstitutionally arrogated, as his, by divine right. He was, in his whole character, so destitute of any dignity or true honour, that he did not only submit to the most degrading and unjust acts within his own realms, but he

agreed to measures, the most unworthy of a prince, in his relations with foreign potentates. The most execrable acts which British history has recorded, are the mock trial, and cruel and long imprisonment, and after his release from confinement in the Tower, and sailing and returning from his last expedition, the judicial assassination of Sir Walter Raleigh, under James I., King of England.

Raleigh was, no doubt, an enthusiast—and so was Columbus—and every other man who has ever made great attempts, or that has ever achieved bold undertakings; but whose projects have either been obstructed by the prejudices, by the jealousies, or by the fears of princes, or of others in power, or in rivalry. There is scarcely a great discovery, or a great invention that has not brought down on the projector, or inventor, all possible discouragement from the prejudices, the ignorance, the doubts and suspicions, of those who have been, and are destitute, of superior abilities. The most disheartening obstacles which enterprising men have encountered, and the most difficult to overcome, have been those created by the presumptuous judgment of ignorant, prejudiced, and feeble minds.

During a considerable portion of the reign of Queen Elizabeth, Sir Walter Raleigh possessed the countenance and support of the queen: and he, by his enterprising and enthusiastic perseverance, aroused more than any other man of his age, that spirit of discovery, navigation, trade, and colonisation, which prepared the foundation upon which subsequently arose the British settlements in America, and which has rendered England a powerful maritime and great commercial and wealthy power.

CHAPTER III.

FIRST PERMANENT SETTLEMENT IN VIRGINIA—GOSNOLD'S VOYAGE—EXPEDITION SENT TO JAMES RIVER—CAPTAIN SMITH.

IN 1602, Bartholomew Gosnold sailed from Dartmouth, in a small vessel, and ventured on a direct course to America, instead of steering by the Canary Islands. He fell in with two islands on the coast of Massachusetts Bay—named those islands Martha's Vineyard and Elizabeth—sowed some wheat, which soon sprung up—traded with the Indians, and returned to England, laden with wood, furs, and gums. The success of this voyage, which diminished the distance more than 1000 miles, induced the Bristol merchants to send out two vessels in the same direction. They traded in like manner, and in the same places, where Gosnold had trafficked, and returned with furs, gums, and other articles.

In 1605, a ship from London sailed by the direct course to America, and fell

in with Long Island, where they sowed wheat, as an experiment, and found it to spring up quickly. They traded for furs with the Indians, at Connecticut River and other places, and returned to London with a valuable cargo of furs and other articles.

Companies were then formed in London and Plymouth, under patent from King James I., to plant colonies in America. The patent, under which the London Company was constituted, granted to Sir Thomas Gates, Sir George Somers and to Richard Hakluyt,* Prebend of Westminster, "*license to make habitation and plantation, and to deduce a colony of sundry of our people into that part of America commonly called Virginia.*" This company was to settle the southern parts. The Plymouth Company, consisting of knights, merchants, and others, of Bristol and Plymouth, was empowered to settle the country north of James River, to be named New England. Captain Smith, Captain Gosnold, and some other persons of note discovered James River.

In December, 1606, the London Company sent to Virginia three vessels, under the command of Captains Smith and Newport, and accompanied by Mr. Percy, a brother of the Duke of Northumberland, Captain Gosnold, and others. They gave the name of Cape Henry to the most southerly point of Chesapeake Bay; on arriving, by way of the Canaries, and landed in April, 1607, at James River—where they commenced the foundation of the first permanent English settlement, amidst the wilderness regions of the western world. They named the place James Town; one hundred and four persons were carried there, with Edward Wingfield, as President. The Plymouth Company also sent two ships, under Admiral Gilbert, to North Virginia, with 100 planters, forty-five only of whom remained.

Captain John Smith, who accompanied this expedition to James Town, was one of the most extraordinary, bold, and judicious men of the age. He was born in 1599, at Willoughby, in Lincolnshire, and was paternally descended from a respectable family, the Smiths, of Crudely, Lancashire. His mother was of the Rickards of Great Heck, Yorkshire. He inherited a competent fortune, and was from his youth upwards, animated by the spirit of adventure. When only thirteen years of age he was ardently desirous of going to sea. His father then died suddenly. His trustees, who proved severe guardians, considered his genius folly; and, resolving to save his money, bound him at the age of fifteen an apprentice to a merchant, or rather shopkeeper and small shipowner, at Lynn. Disliking his employment, he secretly, with only ten shillings and three pence in his purse, left his master. He met accidentally a young nobleman, second son of Peregrine

* Richard Hakluyt was the greatest promoter at the time of the English settlements in America. He was also one of the most intelligent geographers; and his collection of voyages rank next to those in Italian by Ramusio, and far excelled in language, and in good sense the collection of the pedantic and canting, but laborious, Purchas.

Bertie, Lord Willoughby, who was departing for the *grand tour* of Europe. He engaged in the service of the youthful lord ; but they soon became impatient of each other, although Bertie and his brother always entertained a friendship for him.* Smith then entered, and served three years in, the army of Holland. He crossed over to Scotland, expecting to be employed by King James VI. On being disappointed he returned to Lincolnshire, where he lived for some time in retirement—studying military and other works ; and in the exercise of horsemanship and arms, with no associate but that of a poor Italian knight, Theodore Polaloga, an excellent horseman, who had been rider in the family of the Earl of Lincoln. On receiving a part of his fortune he departed for Flanders. He soon afterwards sailed from the Low Countries to France ; and on landing at St. Vallery-sur-Somme, he was plundered of his money and luggage by four *chevaliers d'industrie*, who connived with the master of the vessel in robbing Smith. He landed with only a penny, and had to sell his cloak to pay his passage. On his way south, he overtook and wounded the chief of those who robbed him, and made him acknowledge his crime. He continued his travels, and followed the whole littoral of France, from Dunkirk to Marseilles, examining the fortifications and naval arsenals. He then embarked for Italy, on board a vessel carrying pilgrims to Loretta. A storm arose, Smith was the only heretic on board ; the sailors declared him a second Jonas, and when close to the little islet of St. Marie, near Nice, threw him overboard. He saved himself by swimming ashore. He was taken on board an armed ship that anchored for shelter close to the shore of St. Maloes, in Brittany, and was bound for Alexandria in Egypt. Soon after sailing, they met a Venetian vessel richly-laden, attacked and captured her. They returned with the booty and landed it at Antibes, where they allotted to Smith a share of the prize. He then

* Smith says himself, in the account of his life drawn up at the request of Sir Robert Cotton, " These two honourable brothers, Peregrine and Robert Bertie, gave him sufficient money to return to England. But it was the last thought of his determination, for now being freely at liberty at Paris, and growing acquainted with one Mr. David Hume, who making some use of his purse, gave him letters to some of his friends in Scotland to prefer him to King James. Arriving at Rouen, he better bethinks himself: seeing his money near spent, down the river he went to Havre de Grace, where he first began the life of a soldier. Peace being concluded in France, he went with Captain Joseph Duxbury into the Low Countries, under whose colours having served for three or four years, he took his journey to Scotland to deliver his letters. After much kind usage among these honest Scots at Ripwith and Broxmouthe, but neither money nor means to make him a cavalier, he returned to Willoughby, in Lincolnshire, where, within a short time, being glutted with too much company, wherein he took small delight, he retired himself into a little woody pasture, a good way from any town, environed with many hundred acres of other woods. Here by a fair brook he built a pavilion of boughs, where only in his clothes he lay. His studies were ' Machiavelli's Art of War,' and Marcus Aurelius. His exercise, a good horse, with his lance and ring. His food was more of venison than any thing else. What he wanted his man brought to him. The country, wondering at such a hermit, his friends persuaded one Signor Polaloga, rider to Earl Lincoln, to insinuate into his woodish acquaintance, whose languages, and good discourse, and exercise of riding drove him to stay at Tattersall. Long these pleasures would not content him, and he returned again into the Low Countries."

traversed Italy to Rome and Naples; and, by way of Rome, Florence, and Bologna, to Venice; then crossed the Gulf of Venice to Ragusa, travelled over Albania, and returned through Dalmatia, and Capo d'Istria. He passed into Styria, and entered at Gratz, the service of the emperor, in the war against the Turks. In this war Smith distinguished himself by bravery and strategy. He drew the plan which was adopted to compel the Turks to raise the siege of Ollumpach; invented a night-telegraph, by means of fires; and was promoted to the rank of captain in the Transylvanian cavalry regiment of Count Meldritch. The feats of Captain Smith became famous at the prolonged siege of Stoll-Weissenburg, in Transylvania. On the challenge sent by Tur-Pacha to fight in single combat any Christian officer, it was decided by lot. Whether by contrivance, or by chance, it was the lot of Smith to accept the challenge. This contest was solemnly observed by the besieged and the besiegers, who were ranged on the walls, and on the ground occupied by the assaulting army. Smith slew the Osmanlis. Another powerful Turk advanced. Smith accepted the challenge: on the first shock Smith was nearly stunned by the heavy blow of the Turk's battle-axe; but recovering himself immediately, he ran his antagonist through the body, cut off his head, and carried it in triumph to the Austrian camp. Smith, in his turn, was compelled to challenge any Turk, which was accepted by a powerful Bey, Bonny Mulgro, who was also slain by Smith. The latter ascribes his success, after the help of God, to the superior weapons, skill, and horsemanship of Europe. The town capitulated, but soon after a general battle was fought, and the Austrians were defeated. Smith was left wounded on the field, taken prisoner, and afterwards sold in the slave-market of Axiopolis. He was then sent to Constantinople, where he managed, with extraordinary address, to be sent from thence to serve Timour Pacha on the shores of Azof: from whence he expected to have more liberty and the opportunity to escape. He was disappointed, his hair was shaven off, and, with an iron collar round his neck, chained to work with the common slaves, and frequently beaten by the pacha. On one of these occasions, his chains having been loosened, when he was thrashing out corn, he fell on the pacha, levelled him to the ground by a blow with a *thrashing-bat* (used instead of a flail), clad himself in part of the pacha's robes; and, covering the dead body over with straw, Smith, with a small bag of wheat for food, mounted the pacha's horse, gained the Desert, and reached the Russian advanced post on the Don. He was hospitably received and provided with the means of returning to Transylvania; where he arrived by a tedious and circuitous route; and was received joyfully by his friends. He afterwards traversed numerous parts of Europe. He visited Spain and Barbary; was on board a ship of war, commanded by a Captain Merham, in a fight with two Spanish ships, and returned to England some time before the departure of the first expedition sailed for Virginia. His testimonies from the

Imperial government, and from the Dutch authorities, were of the highest character, and all proclaimed him a moral, religious, honourable, and brave man.*

On accompanying the expedition, he did so with the full understanding that he was to be one of the councillors, who were, on their arrival, to elect the president of the new government; but King James, who loved ostentatious mystery, directed that the commission, which contained the names of the provisional councillors, should not be opened, until twenty-four hours after their landing in Virginia. This vain artifice, created, at the very commencement of the colony, the grounds of not only future but immediate evils. A long voyage by the circuitous course of the Canary and West India islands, was almost naturally incident, during four months, to disagreements on board of the ships in which so many were crowded. When the commission was opened, the list of names was far from satisfactory, and those who were not included were envious and clamorous. The known abilities and high character of Captain Smith, created so much jealousy, that although he was one of the council named in the commission, with the view of his being elected president, he was excluded altogether from a seat in the new government.

Before the departure of the expedition, a code of instructions drawn up, by nine persons, was issued, under the sign-manual, by the king. They enjoined the

** Patent of Nobility granted to Captain Smith by the Duke of Transylvania.*—"Sigismundus Bathori, by the grace of God Duke of Transylvania, Wallachia, and Moldavia, Earl of Anchard, Salford, and Growenda; to whom this writing may come or appear. Know that we have given leave and licence to *John Smith*, an English gentleman, captain of 250 soldiers, under the most generous and honourable *Henry Volda*, Earl of Meldritch, Salmaria, and Peldoia, colonel of 1000 horse and 1500 foot, in the wars of Hungary, and in the provinces aforesaid, under our authority, whose service doth deserve all praise, and perpetual memory towards us, as a man that did for God and his country overcome his enemies; wherefore, out of our love and favour, according to the law of arms, we have ordained, and given him in his shield of arms, the figure and description of three Turks' heads, which with his sword, before the town of Regal, in single combat he did overcome, kill, and cut off, in the province of Transylvania. But fortune as she is ever variable, so it chanced and happened to him in the province of Wallachia, in the year of our Lord 1602, the 18th day of November, with many others, as well noblemen as also divers other soldiers were taken prisoners by the Lord Bashaw of Cambia, a country of Tartaria, whose cruelty brought him such good fortune, by the help and power of Almighty God, that he delivered himself, and returned again to his company and fellow-soldiers, of whom we do discharge him; and this he hath in witness thereof, being much more worthy of a better reward; and now intends to return to his own sweet country.

"We desire, therefore, all our loving and kind kinsmen, dukes, princes, earls, barons, governors of towns, cities or ships, in this country, or in any other provinces he shall come in, that you freely let pass this the aforesaid captain, without any hindrance or molestation.

"And this doing, with all kindness, we are always ready to do the like for you. Sealed at Lips-wick, in Misenland, the 9th of December, in the year of our Lord, 1603.

"SIGISMUNDUS BATHORI.

"*With the proper privilege of his Majesty.*—To all and singular, in what place, state, degree, order, or condition whatsoever, to whom this present writing shall come; I, William Segar, Knight, otherwise Garter and principal King of Arms of England, wish health, know that I, the aforesaid Garter, do witness and approve that this aforesaid patent I have seen signed and sealed, under the proper hand and seal manual of the said Duke of Transylvania, and a true copy of the same, as a thing for perpetual memory, I have subscribed and recorded in the register and office of the Herald of Arms. Dated in London, the 19th day of August, 1625, and in the first year of our Sovereign Lord Charles, by the Grace of God, &c.

"WILLIAM SEGAR, GARTER."

preaching of the gospel and public worship, according to the rites of the church of England. Legislative and executive functions were conferred on a council. The laws they passed were not to be contrary to those of England—nor in force until allowed by royal authority. Penal inflictions were not to include death; for which persons accused could only be tried in England. Summary trials were allowed for misdemeanours. Lands were to be held by the same tenures as in England. A community of labour, for mutual assistance, was to subsist for five years. Kindness to the heathen inhabitants, and the communication of religious knowledge to them, were also enjoined by the royal instructions. These instructions, if adhered to, were judicious; but the king's pedantic folly, in not naming openly, before they left England, those who were to constitute the members of the colonial government, very nearly caused the complete failure of the settlement founded at James River. Dissensions broke out amongst them, the president who was elected proved a suspicious, and utterly incapable governor. The site chosen for James Town was more selected as a place of security than as for such advantages of situation as would insure its permanence as a town.* The buildings were commenced and erected on a neck of land, formed nearly into an island, by the course of the main river, and by a small fordable stream and lowland, over which the tide flowed, so as to render it, at certain times, an island rather than a peninsula. The president, however, neglected, or rather, from his suspicions, abstained from erecting defences, and he also discouraged armed exercises among the colonists: the latter disliking agricultural labour, sought profit only by bartering with, and in their bargains cheating, the Indians: quarrels followed, and the natives rushing in upon the undefended settlement, many of the colonists were killed.

After Newport sailed with the ships to England in June, the colonists having been improvident, their stock of food was soon exhausted. If they had maintained good faith with the natives, the latter would, on fair terms, have supplied them with maize and wild animals. The heat of the climate, and the exhalations from the decayed vegetable and fossil substances, brought agues and dysentery. Before the month of September, the colonists were reduced to half the number landed in the month of April. Disease and the fury of the natives, provoked by the fraudulent conduct of the new settlers, appeared, as it were, in combination to annihilate the colony. Dissensions, accusations, and desperation, prevailed among those who were not carried off. The president's incapacity was not only glaring, but he was detected in embezzling, for his own use, the remaining stores, and in seizing the pinnace to escape from the settlement. Bartholomew Gosnold was among the first who died. Captain

* "There are places at which," says Jefferson, 'the laws have said, *there shall be towns*,' but nature has said *there shall not*.' Of the first town or settlement in Virginia (James Town), two or three old houses, the ruins of an old steeple, the churchyard, and faint traces of rude fortifications, are the only local memorials."—*Book of the United States*, 1840.

Smith, who had been excluded from the government, was, during the period of its calamity, actually engaged in making himself well acquainted with the country and its resources. His constitution, although exposed for many years to great hardships, during his early military career, was still healthy and vigorous; and this blessing was justly attributed to the unexceptionably regular and moral habits of this excellent man.

A number of the colonists, needlessly reduced by famine and disease, were only restrained from leaving the settlement by the efforts he made to procure supplies and by the labours he endured for them, until a reinforcement arrived of 120 men from England, with implements of husbandry, seeds, provisions, and other supplies. These men consisted of gentlemen, labourers, *jewellers*, and *refiners of gold*. It soon became manifest that they were men incompetent for any productive labour, except seeking for gold: they did nothing, but collect a cargo of a *glittering* sediment found on the shore, which was sent to England, believing it to be gold. All agricultural industry was suspended. A cargo of cedar wood, which had been sent to England the same year, proved the only article exported of any value.

It was in consequence of this *golden delusion*, and the licentious conduct of the colonists, that Smith made the adventurous, and most fatiguing survey ever made by man, in an open boat: exploring, during two voyages, every inlet and bay on both sides of the Chesapeake, from Cape Charles to the Susquehanna. He also ascended the principal rivers to the falls. His object was to ascertain the solid and durable resources of the countries he explored, and to establish conciliatory relations with the natives. While he was absent, the golden frenzy of the colonists calmed into reflection, on discovering that the cargo which they sent to England was merely an earthy substance. They now beheld, in the absence of the man whom they had in their avarice disregarded, famine and sickness ready to destroy them. Discontent among themselves, and inability to encounter difficulty, or to obtain food, rendered their condition hopeless. Smith again appeared, with supplies obtained from the aborigines, and again saved the settlement. He was then immediately elected president.

His detention by Opecanough,—his condemnation to death by the Sachem Powhatan,—his escape through the agency of the daughter, Pocahontas—his providing supplies to the colonists, and the extraordinary survey which he made—his election to the presidency, after saving the colony, and securing the friendship of Powhatan and the natives, by his address,—his skill in obtaining provisions from the aborigines,—the means he adopted for constructing dwellings for the colonists, and fortifying James Town,—the whole course of his administration, and the dignified bearing, yet justness and morality, of his character, not only saved the place and the people from destruction, but established for John Smith the reputation of founding the first permanent settlement—the first nucleus of civilisation in America.

But his administration was, however, not acceptable to the London Company, the patentees of which regarded only the accumulation of wealth,—the discovery of mines and metals,—and opening a passage to the South Seas. They accordingly obtained in May, 1609, a new charter, which entirely deranged the rights of the colonists, who had emigrated under the privileges of the former one.

The new charter was granted to twenty-one peers, ninety-eight knights, and a multitude of esquires, doctors, gentlemen, merchants, and sundry of the corporation of London, under the title of "The Treasurer and Company of Adventurers of the City of London for the first colony of Virginia." A council in England had the whole patronage and power to administer its affairs. Lord De la Warre was appointed governor and captain-general of the colony. Nine ships, under Captain Newton, were sent out with 500 emigrants, and with authority to supersede the existing administration.

The emigrant vessels, except one, arrived at James Town, but that one was stranded on the Bermudas, on board of which were Captain Newton, Sir George Somers, and Sir Thomas Gates; who had, by a most unfortunate spirit of caution, been empowered, each separately, with the same power given to Newton. The new emigrants consisted chiefly of profligate young men, of indigent gentlemen, of tradesmen of broken fortune, and of family dependents, too infamous to be retained decently in society. The traders, though unprovided with any legal instruments, proclaimed the new charter, and overthrew the existing administration. The colony became a confused anarchy, the turbulence of which roused the vengeance of the Indians. In this emergency they were forced to appeal to Smith, who again saved the settlement. The accidental explosion near him of a quantity of gunpowder, at this juncture, completely disabled him physically, and forced him, from the want of surgical aid, to sail for England. He never returned to Virginia; the settlement of which he had conducted through such formidable privations and dangers. He left the colony opportunely, for he would have been soon deprived of authority by the company, and he lived honourably in England,* long enough to present to the world a valuable stock of knowledge, in an account of his travels and discoveries. In 1614 he went on a voyage of discovery to the countries north of Virginia, and explored the countries around Massachusetts' Bay, and all those of the New England states. He penetrated the country, trafficked with the Indians, employed part of his crew in tracing a map of his surveys, and returned to England. He died on the 21st of June, 1631, aged only fifty-two years.

Smith left the colony in Virginia, consisting of 500 persons, amply supplied with provisions, and having cattle, implements of agriculture, and arms for their defence—wisdom and industry were alone wanted to insure its permanence and

* Stilth says, "He became so famous in England before his death that his adventures were dramatised and represented on the stage much to his annoyance."

prosperity. But, soon after his departure, folly, idleness, riot, and profligacy distracted the colonists and exasperated the aborigines. Famine was the consequence; the settlers were reduced to cannibals,—they fed on the flesh of the natives whom they had shot, and of their companions who died from disease or hunger,—and in six months after the departure of Smith, when Newton, Gates, and Somers arrived, the 500 colonists were reduced to sixty. The triumvirate immediately decided on abandoning the settlement, and they accordingly embarked for England.

Before they descended to the mouth of James River they fortunately fell in with Lord De la Warre, who left England accompanied by a large colony, in three ships, amply supplied with all kinds of stores, and with a royal patent as governor of Virginia. He carried back the fugitives to James Town, and, by vigorous and wise administration, he re-established the settlement, and left it in a prosperous condition, when he was compelled by broken health to return to England. His successor, Mr. Percy, was a far less efficient governor, and the colony of Virginia suffered reverses. But it is from the time of the presidency of Captain Smith, and the assumption of the government by Lord De la Warre in 1610, only 237 years ago, and 118 years after the discovery of America, that we date the permanent settlement, by England, of North America.

Some time after, 100 *planters* were sent by the Plymouth Company to Sagadahoc, at the mouth of the Kennebec, in the year 1609. The most conspicuous members of this company were Sir John Popham, chief justice of England, Sir Ferdinand Georges, governor of Plymouth, and Sir John Gilbert, nephew of Sir Humphrey Gilbert. The expedition was sent out under the judge's brothers, Henry and Raleigh Popham, brothers of Sir John. The place where they settled was small, and no more than forty-five colonists remained. They endured great privations. The president, Henry Popham, and many others, died during the winter, and the remainder abandoned the colony, and retired in the next summer to England. The Plymouth Company made no further attempts than a few voyages to fish at Cape Cod. During the same year the French wintered in a few huts on the north bank of the Lawrence, where the town of *Rivière des Trois* now stands.

CHAPTER IV.

SETTLEMENT OF THE NEW ENGLAND AND MIDLAND STATES.

IN order to comprehend and continue an account of the Progress of America, we must follow the advance of the European race into the wilderness

regions which extend, first, along the Atlantic coast and rivers, back to the Alleghany mountains; and then beyond those heights, over the regions comprised within the basins of the Ohio and Mississippi, and west to the Pacific Ocean.

The spirit of enterprise and the love of adventure has urged bold men to encounter, amidst those vast wilds, the most perilous dangers, the greatest fatigue, and the most incredible privations. From the time that Europeans first landed on the shores and penetrated the forests of the newly-found world, this daring spirit has been constantly manifested; whether in the milder climate of the southern regions, or the bleak, frigid countries of the north. The man of European origin has persevered in traversing forests and prairies,—in crossing rivers, lakes, and swamps,—and in clambering up mountains, uncertain as to where rest was to be found at night, or food procured during the day. The privations of hunger, the fatigue of long journeys, and the attacks of wild beasts and of ferocious savages, have all been disregarded, and overcome, by indomitable perseverance and courage—and—not always with rectitude towards the aboriginal occupants of the soil.

From the first planting of settlements by the English on the continent and islands of America, the most fearless spirit of enterprise animated, not only those who made voyages in pursuit of fame and gain, but those, also, who fled from their native homes, to escape from persecution, and, with the hope of enjoying on the shores and amidst the wilds, of the new world the blessings of religious freedom and civil liberty.

Notwithstanding the deplorable failure of the first attempts at settlement in Virginia, and the almost incredible sufferings of the first New England colonies, multitudes began, soon after, to expatriate themselves, in order to find, in distant countries, those things, or those enjoyments, which they in reality did not, or could not, possess at home, or of which they fancied themselves destitute.

Each annual emigration increased the succeeding years' number of those who left Europe for America. For, according as men were driven from England, Scotland, or Ireland, either by the goading of poverty, or by disabilities on account of religious scruples, and the love of civil liberty, it was natural and common for them to remove to those parts of America where some of their friends or neighbours had previously gone.

The hatred of arbitrary power, either in a political or religious form, was certainly the predominant cause of the emigrations that peopled Anglo-America. Its rapid settlement was caused, in a much greater degree, by the persecutions and disabilities which drove the Puritans to New England, the Quakers to Pennsylvania, and the Catholics to Maryland, than by the mere spirit of adventure, or the more pressing considerations, which urge men to escape from the evils of poverty.

In 1614 the Dutch colonised the banks of the Hudson. The important

permanent settlement of the New England States did not succeed until the year 1620, when the Pilgrim Fathers arrived at the place which they called Plymouth, in Massachusetts Bay. The perils they overcame, the privations they endured, and their final success, have been fully described by several writers, and by none more ably, than by Mr. Bancroft, the author of the "History of America." Our limits will not permit us to extend further than to a general sketch of the progress of the colonisation of the country.

Three years after, the Pilgrim fathers were followed by others, who settled in New Hampshire. The Swedes and Finlanders purchased a tract of country from the aboriginals, near the falls of the Delaware. They gave their colony the name of New Swedeland, founded a settlement on it, and built forts for its defence.

Settlements were made after the year 1606 by the French in Nova Scotia, and in 1608 in Canada. Cape Breton and Placentia, in Newfoundland, then attracted their attention. Florida was attempted, most disastrously, to be colonised by France.

In 1628 the next settlement in Massachusetts Bay was established by John Endicot and his wife. In 1633 Lord Baltimore began colonising Maryland, having previously established the colony of Avalon, or Ferryland.

Settlements were formed in North Carolina in 1628; in Rhode Island in 1635; in New Jersey in 1664; and in South Carolina in 1669. The laws for governing the latter were drawn up by Locke.

William Penn, in 1682, went out to the country which was named, for him, Pennsylvania, under the authority of a royal charter; but that just man purchased all the lands he colonised from the aborigines, whose confidence and attachment he secured. This colony, having nothing to fear from the natives, prospered in consequence far more rapidly than all the others.

Penn received from his sovereign an absolute title to the lands, on the fanciful distinction, or rather wilful subterfuge, of Christian over heathen right to the soil—but he, acting upon the principle of "uniform justice," never would invade a foot of territory, which he had not before purchased from the Indians.

Penn considered immemorial occupancy superior to all other tenures,—that this right of the red man was founded in nature,—that this tenure was the free gift of Heaven, which no king, no pope, no man, had a right to question, or any equitable pretence to destroy;—and, therefore, his principles required him to commence with justice to the natural occupant of the soil.

"'Tis true," says an American reviewer, "that Penn designed to promote his own fortunes, while he secured an asylum for the persecuted—while he designed 'a holy experiment, and setting an example to nations,' he spent money lavishly, and expected a return."

One hundred and fifty-three years ago Penn writes, "Philadelphia, the expect-

tation of those who are concerned in the province, is at length laid out. It is advanced in less than a year to about eighty houses and cottages, such as they are, where merchants and handicrafts are following their avocations as fast as they can."

Such was the commencement of his "dear city of Coaquonnoc," as the Indians called the ground on which it stands. Such the origin of Philadelphia—a town, as it now stands, planned by its founder.

The early moral and prosperous condition of Philadelphia, and the state of Pennsylvania generally, may be attributed entirely to the wise and well-adapted government and laws instituted by Penn.*

In the first place, his conciliatory treaties with the red warriors, of whom, after giving an affecting account of that race, he says, "Do not abuse them; but let them have justice, and you win them," might have been practised within the last twenty years towards the Indians of Florida, with an effect which would probably have prevented the horrible massacres which disgraced that territory.

With the founder of Pennsylvania, the measures he adopted, and his demeanour towards the aborigines were wise, and so happy that it became a maxim among them, "never to lift the tomahawk against the race of William Penn."

Thus was his colony secured, from the first, against the most terrible calamity which had once exterminated, and long harassed, that of Virginia, and afflicted and kept all the others in a state of alarm.†

The country of William Penn was called "The Poor Man's Paradise," Poverty was unknown within all its borders. The pleasant villages, on the eastern side of the Delaware, welcomed the virtuous exile with a homely and cordial welcome; and there was so little of bigotted human nature in these adventurers, that they were unequivocally and magnanimously tolerant, when all the rest of the European family in North America was engaged in religious persecutions.

It was remarkable that such a person should have come from the halls of a

* "Every Philadelphian has a right to be proud of the foundation and founder of his state. Never was an enterprise more wisely and happily conducted. It was the first time the world had ever seen an individual of commanding influence and station, acting so decidedly upon the Christian principle, that no man can serve his own interests so well as by serving others."—*American Review*. Unfortunately, Philadelphia has not maintained unstained, during the last seven years, this superior moral character. But we expect it will redeem itself in the near future.

† With reference to the name given to the colony, Penn writes on the 5th of January, 1681, "This day, after many waitings, watchings, solicitings, and disputes in councils, my country was confirmed to me under the great seal of England, with large powers and privileges, by the name of Pennsylvania; a name the king would give it in honour of my father. I chose New Wales, being a hilly country; and when the secretary, being a Welshman, refused to call it New Wales, I proposed Sylvania, and they added Penn to it, though I much opposed it, and went to the king to have it struck out. He said it was past, and would take it upon him; nor could twenty guineas move the under-secretary to vary the name (bribes were then common), for I feared it should be looked on as a vanity in me and not as a respect in the king to my father, as it really was. Thou mayst communicate my grant to friends, and expect shortly my proposals. 'Tis a dear and just thing; and my God, who has given it me through many difficulties, will, I believe, bless and make it the seed of a nation. I shall take a tender care to the government that it be well laid first."

slavish court,—and under the authority of an arbitrary king, and establish a state with the single-hearted ambition “to show men as free and as happy as they could be.” It may be even doubted whether his institutions were not more mild than his colonists were fitted to enjoy; certainly, the privileges which he gave them were not always used as gratitude would have directed.

His laws and instructions were certainly not to favour evil-doers; “for all prisons,” said he, “will be workhouses.” On examining the laws of Pennsylvania, we are immediately struck with the remarks of Chancellor Kent, one of, if not, the most eminent American writers on jurisprudence: speaking of an English law-book,* he observes, “The Pennsylvanian lawyer cannot but be struck on the perusal of this work—equally remarkable for profound knowledge and condensed thought—with the analogy between his proposed improvements, and of all essential reforms in the English laws, suggested by the greatest reformers of the law in England, and the long familiar practice of Pennsylvania.†

There have been lately some revisions in these laws,—if possible, they are improvements,—which go still further to secure the object of “uniform justice.”

“Whilst these laws,” says an anonymous American writer, “are held sacred, and not even *a majority* can invade them, we have a bulwark more effectual in guarding liberty and preventing the intrusion of wild and dangerous reforms than that possessed in the institutions of any other nation under heaven.”

It is not, however, sufficient to have good laws, but these must be obeyed, as they generally have been in Pennsylvania.‡ Where they are not, the courts should have more power, as well as the authority to enforce them. This is vital to the honour and safety of America.

With respect to the countries now forming British America, it was not until after the reduction of Cape Breton and the conquest of Canada, which added nearly the whole of North America to the British empire, that adventurers, stimulated by the spirit of enterprise, left the mother countries, and established themselves in the newly-conquered territories. These were generally persons in trade. Farmers or others, who expected to derive their subsistence from cultivating the soil, directed their course to that part of America now forming the United States.

* Humphreys on Real Property.

† Among other practices, that of recognising foreign letters of administration has been in force since the days of Penn.

‡

“And sovereign law the states collected will
O’er thrones and globes elate,
Sits empress, *crowning good, repressing ill.*
Smit by her frown
The fiend *distraction* like a vapour shrinks
And e’en the dazzling crown
Hides her faint rays, and at her bidding sinks.”

SIR W. JONES.

The American revolutionary war, it is true, arrested the spirit of emigration; but no sooner was the independence of the American republic acknowledged by England, than the majority of those who left Great Britain and Ireland for America, were, as formerly, fascinated into the United States. This arose, in a great measure, from the mighty resources of the northern British possessions being imperfectly known in the United Kingdom.

Some Scotch, and a few Irish families, together with a few German and Swiss Protestants, found their way before this period to Nova Scotia and Prince Edward Island (then called St. John's). A few Highlanders, also, many of whom were disbanded soldiers, settled at Glengarry, and other places above Montreal. It was not, however, until after the American revolutionary war that emigration, of any great consequence, to the British northern colonies took place. From that period to the present time, notwithstanding the vast swarms that have annually flocked to the United States, not less than from eight, to lately fifty thousand settlers, have arrived yearly in British America from England, Scotland, and Ireland.

In those countries, which now form British America, with the exception of Nova Scotia, the colonists were not so often doomed to experience the terrible vengeance of the Indian tribes; yet the hardships they had to encounter and overcome in other shapes were almost incredible.

Slavery was introduced ("by special providence," as was said and is said in South Carolina), at the dawn of colonisation (1620), into the very land to which *Englishmen*, Christians, too, had flown to plant and enjoy liberty.

There is no denying that the early settlers were greatly assisted and enriched by slave labour, and that the abominable traffic was first persevered in from an *idea of its necessity*, in order to bring a wilderness country under cultivation. But, exclusive of the injustice and immorality, how much greater the consequent evils are, and will be, than all the possible advantages ever derived or ever to be derived from the slave-trade and slave-holding.

The privations which the early colonists endured, and the hardships to which circumstances connected with a wilderness country subjected them, were severe in a degree of which those who now plant themselves in America, or who go well provided and secure to Australia, Van Diemen's Land, or New Zealand, can have only the most feeble conception. They had not only to suffer the miseries of hunger and the want of almost every convenience to which they had been accustomed in England, but they were always harassed and often murdered by the Indians, and at all times exposed, with their families, to be massacred or burnt in their dwellings.

The winters were either much more severe than at present, or the sufferings of the first settlers made them describe the frosts as more intense, the snows deeper, and the duration of cold much longer.

The non-existence of roads, the want of boats, or even for some time of canoes, and the emigrants' ignorance in the management of the latter, rendered it a business of great difficulty to pass from one part to another of a country covered with thick forests and intersected with rivers, lakes, and branches of the ocean. The use of the axe, also, or the art of chopping, is an acquirement indispensable in a wooded country, with which most new settlers are unacquainted. With this tool, a gun, one or two hoes, and a pot, the American backwoodsman will make his way through, or plant himself and family in, the midst of a most dreary forest, and secure at the same time the means of subsistence.

Innumerable, indeed, were the miseries which emigrants had to reconcile themselves to for several years after the early settlements of our colonies; and it certainly required in them more than ordinary resolution and fortitude to establish themselves, in defiance of not only real but imaginary difficulties.

Natural obstructions have in all countries been only removed by the industry and fearless intrepidity of man. Such formidable obstacles to settlement and cultivation as the New World at first presented, and which still characterise the remote districts, existed at one period in Britain, and in all the kingdoms of Europe; and in the same progressive ratio as the settlement and cultivation of any wilderness country proceeds, do natural obstructions disappear: those, therefore, of the most disheartening character to men accustomed to plough the long-cultivated lands of Britain and Ireland, were slowly but gradually overcome in North America. Leading roads were opened through the different provinces, and by-roads to the settlements; the communication by water between different places, by means of craft of various descriptions, became attended with but little inconvenience; the necessities, and even the luxuries of life, were at last after great endurance and hard labour, to be obtained in abundance at moderate prices, and at no great distance from the most remote settlement. To these great advantages have, during the last twenty-five years, been added the railroad, the canal, and the steam-ship.

Although the British possessions in America were, in some respects, naturally inferior to those of other Europeans, yet the security of property, and more liberal treatment on the part of government, advanced their prosperity on a more solid foundation.

The majority of the first settlers consisted of hardy yeomen, and men of education, rank, and enterprise, who, in leaving England, forsook their homes, and those comforts that are only found in old countries, and also those attachments that are most dear to the human bosom. But these circumstances alone are not sufficient to do justice to their courage and magnanimity. The victories they obtained over all the complicated hardships that can assail the heart, and stagger the fortitude of man, exalt their character in the estimation of those who

value facts, rather than military splendour, to a rank equally illustrious, as that of the greatest people recorded in history.

They carried with them to America resolute hearts and intelligent understandings, and that unconquerable spirit of perseverance which surmounts the numberless difficulties that await all great undertakings.

The success attending the actions of such men astonished Europe. Their industry and indefatigable activity insured their prosperity; their improvements in all the useful arts did honour to their ingenuity; and it must not be forgotten, that, notwithstanding their peculiar circumstances, and the occupations they followed, they were, from the first foundation of their settlements, particularly careful to provide for the education of their children.

Their position was favourable to commerce; and their natural turn and temper, ever aiming at new discoveries, and incessantly employed in the search of whatever might better their circumstances, carried them into every quarter from whence profit could be obtained. There was hardly a port or spot in the American hemisphere, in which business could be transacted, where they were not to be found. Without living in European luxury, they secured all the substantial and comfortable enjoyments of life, with many of its elegances and refinements.

They in reality became a rich and flourishing people; and if ever any country might have been considered the seat of human felicity, British North America, previously to the sad story of colonial oppression, must unquestionably have deserved the appellation.

The first habitation made by the English in the West India Islands, was on the island of Saint Christopher, in 1625. Barbadoes was settled by the English in 1627—8; Montserrat in 1632; Tortola was settled by the Dutch in 1648, from whence they were expelled by the English in 1666. The Bahamas were colonised by England in 1672; Tobago was first settled by the Dutch in 1632, and ceded to England in 1763; Grenada, which was first settled by the French in 1650, and St. Vincent in 1655, were ceded to England in 1763; St. Lucia was attempted to be settled by England in 1639, and by France in 1650. The English purchased it from the Caribs in 1664, and dislodged the French. It was abandoned and declared neutral in 1713; added to France in 1763, taken by the English in 1778, restored to France in 1783; taken by England in 1794; ceded to France in 1802, and finally taken by England in the following year. British Guayana, including Demerara, Essequibo, and Berbice, was first settled by the Dutch, and taken by the English in 1796, and ceded finally to England in 1814. The island of Trinidad was colonised by Spain, as early as 1588, and captured by the English in 1797.

The settlement of Barbadoes, and the conquest of Jamaica by the fleet of the Commonwealth in 1655, formed the era in which British power acquired a permanency in the West Indies. Oliver Cromwell, in the prudent and vigorous exercise of his sovereignty, has been severely condemned by Hume, and even by that

ultra-republican historian, Catharine Macaulay, for his maritime expeditions against the Spaniards. Never did Hume write a paragraph which so glaringly exposes his superficial examination of facts, *so frequent* in many chapters of his fascinating history, than when he pronounces the armament sent forth by Cromwell against the Spaniards in the West Indies as "a most unwarrantable violation of all treaty."

We have carefully examined all the facts which induced Cromwell to equip the fleet which conquered Jamaica, and if ever oppressions, and injustice, and cruelties, exercised by the people or power of one country against those of another can justify a war, no monarch ever acted with more wisdom and dignity than the sovereign of the Commonwealth of England did, when he directed hostilities against the Spaniards in the West Indies.*

England fostered and protected her colonies with parental solicitude, and only secured in return the exclusive right of their trade. We are far from considering this exclusive policy sound, or wise; but the particular circumstances of the British Plantations did not cause it to operate perniciously. Spain and Portugal not only claimed the commerce of their colonies, but, governing them with despotic tyranny, seized the greatest share of their riches for the benefit of the crown, or for the purpose of upholding the splendour of a church, whose terrible power, aided by the superstition of the age, kept the human mind in servile degradation, and personal liberty under rigorous control.

Holland and France sold the commercial property of their colonies to trading companies; who, in order to make the most of their privileges, took all the advantages that the spirit of monopoly could devise. They not only fixed the value of the articles they sold to the colonists, but they also established the lowest prices for the produce of the lands, and prevented their occupants from growing any more than could be disposed of at an unreasonable profit in Europe.

The British colonies did not experience the like ungracious and illiberal treatment. Satisfied with the general profits of their commerce, England left the trade open to every individual in her dominions; and did not either confine it to particular ports, like Spain and Portugal, nor sell it, as France and Holland did, to a company of traders.

With the exceptions of the northern countries of Europe and the East Indies, the British colonists were permitted to trade with all parts of the world. In all the American hemisphere, in Africa, along all the coasts of the Mediterranean, Portugal, and Spain, the vessels of British America enjoyed a lucrative commerce; and they had the amplest liberty of trading with the English West India islands. *Rum, sugar, with the produce of their fisheries, they carried to all the markets to which they traded; so that, although a number of

* We shall, in a subsequent volume, endeavour to prove the truth of this assertion, from evidence that none, not even the greatest admirer of the apologists of the Stuarts, can disprove.

articles were exclusively appropriated to an importation to and from Great Britain, yet enough was left for the colonists; particularly, when we consider that the countries they possessed gave them so much occupation at home.

England, on planting her American colonies, granted them *the full privilege of governing themselves, and the right of forming such laws as the wisdom of their respective legislatures should consider necessary*; and, in giving them such ample powers to provide for their interest and prosperity, only reserved *the political connexion under the same sovereign, with the general benefit resulting to the empire from their trade*.

In short, the conduct of Great Britain in her colonial management, from their first settlement to the year 1755, and, with the exception of an unsound navigation law, and fallacious commercial regulations, which at the time were to a great degree inoperative, exhibits a lesson of wisdom to those powers who either possess or are disposed to plant colonies.

But after that period, those who wish for the partition of great empires will learn useful instruction by studying the history of the measures that led to the independence of the United States.

CHAPTER V.

CAUSES OF DISCONTENT IN THE COLONIES.

AMONG the first causes of discontent and complaint in the British colonies, were the restrictions which discouraged manufactures, by confining every province to the use of its own, and prohibiting the reciprocal importation of their respective fabrics. To prevent a whole people from following any branch of industry, is assuredly a measure which human nature cannot bear with tame submission: nor can the severity of the regulation be denied, even on the ground that the articles prohibited could be imported cheaper from England. The injury felt by the prohibition was not, at the time, of much consequence; but the regulation was in itself considered a kind of insult to the understanding, more intolerable than pecuniary oppression.—(See Commercial Policy of England and America in the second volume of this work.)

The discontent arising from this restriction would, in all probability, have passed away, had it not been succeeded by a deprivation of a more serious nature to the colonies, and equally injurious to the interests of England.

For more than a century, a very lucrative branch of trade had been carried on between the British West Indies and the Spanish settlements in the West Indies, and in Mexico, and South America. For many years

the North American colonies possessed a great share of this advantageous commerce. To the British it was a pursuit of clear gain and prodigious value. It consisted of an exchange of vast quantities of all kinds of commodities for the precious metals, and various products, as cotton and indigo, which were all remitted to England. The Spanish monarchy, in the selfish and impolitic spirit of its colonial system, believed that the trade was ruinous to the Spaniards, in the same degree as its immense advantages were profitable to the English, stationed *guarda-costas* to scour the coasts, and to seize every vessel that approached near them. The indiscriminate licence with which they executed their orders provoked the war of 1739, between Great Britain and Spain. England, at the peace, interdicted the trade by her home, or colonial vessels, with the Spanish settlements. The Spaniards, in the colonies, secretly encouraged a contraband trade with the British colonists: which, though greatly limited in its extent, was still of considerable reciprocal profit. Although it was by no means the business of England to prevent this trade, yet a system was afterwards adopted and pursued as effectually as if a convention had been entered into with Spain for the purpose, to reward the commanders of the British cruisers. The seizures made by the latter, who acted as if they had received their commissions and their pay from Spain, in a very short period completely destroyed this profitable commerce.

As far back as the year 1755, limitations were imposed, by absurd and impolitic laws and orders in council, upon the trade of the British plantations in North America and the West Indies, and prevented the importation of foreign goods, as formerly, free of duty, from Great Britain to North America, produced loud discontent both in England and America. Up to this period the trade and navigation between Great Britain and the colonies might be considered nearly under the same regulations as a coasting trade,—much the same as between one county in England and another—as between Middlesex and Northumberland.

Unwise measures had previously been carried into effect: taxing the plantations being one object; an undue exercise of power on the part of the government in order that the colonists should be continually reminded and made to feel the royal prerogative was another. Jamaica resisted the arbitrary constitution which the then governor, Lord Carlisle, was directed to establish. The period of colonial mismanagement attained its enormity soon after the accession of George III.

The annihilation of the trade with Spanish America was the first of the most grievous inflictions, as it was from it that the colonists drew the supplies of gold and silver that enabled them to make remittances to England, and to provide a circulating specie for the internal use of the colonies. The exports to Jamaica alone fell, in 1765, short of the value exported in 1763 not less than 168,000%. The exports to the North American colonies were diminished in proportion. The prohibition of so profitable a commerce shook the vitals of American prosperity,

and distressed the manufacturers and merchants of England. The servile complaisance of Great Britain to Spain, and the unwise policy of oppressing its own subjects to oblige foreigners, were complained of by the people of England as well as by the Americans, but not listened to by ministers. George III. was not altogether as servile to Spain as James I. He did not cut off the heads of his subjects to gratify the court of Madrid. He merely stopped short, by sacrificing their fortunes to Spanish colonial legality.

The peace of 1763 terminated a war which was both advantageous and glorious to Great Britain. The treaty of Paris, besides ceding to her several islands in the West Indies, and establishing her power in the East, gave her the sovereignty of the vast continent of America from the Floridas to the Arctic Sea. The expense of the war, however, was immense, and greatly increased the national debt. Resolutions were soon after taken by ministers to tax the colonies, in order to pay, in a direct and explicit manner, a share of the public burdens.

Their ability was not doubted, and it was considered equitable that they should contribute largely for the advantages they possessed. The colonies were, however, fully persuaded, whatever might be the necessities of the mother country, that, exclusive of the restrictions laid, during late years, on their commerce, the sole enjoyment of their trade was a tax in itself more in proportion than all that were levied on the people of Britain.

The right of taxing them, without their being represented in the British parliament, they denied, as resolutely as their ancestors did the payment of ship-money to Charles I.; while they claimed also the privilege of being represented, as their undoubted birthright.

Ministers expressed astonishment on hearing such language from the colonists, and charged them with ingratitude and disloyalty, and with being solicitous only to profit by the generosity of the mother country. The Americans repelled this unfounded charge with indignation. They gloried in calling Britain their mother country; they never disgraced the title; they always obeyed her just and lawful commands; and they submitted, for her benefit, to heavy burdens and commercial restrictions. During the last war they raised 20,000 men and maintained them at their own expense; and they fitted out the expedition that took Louisbourg in 1745. Antecedent to which, they supplied the British expeditions against Spanish America with several thousands of their best men, and exerted themselves with equal bravery against the French in North America.

They assured the king, in their petition, that, notwithstanding their sufferings they retained too high a regard for the kingdom from which they derived their origin to request any thing that might be inconsistent with her dignity or welfare. "These," said they, "related as we are to her, honour and duty, as well as inclination, induce us to support and advance." "At the conclusion of the last war," they go on to observe, in one of their addresses to the king and people of Great Britain, "the

Genius of England, and the spirit of wisdom, as if offended at the ungrateful treatment of her sons, withdrew from the British councils, and left the nation a prey to a race of ministers, with whom ancient English honesty and benevolence disdained to dwell." "They did not complain of parliament, for it had done them no wrong, but solely of the measures of ministers."

The complaints of the colonists have always been acknowledged temperate and well founded, until the conduct of ministers convinced them that nothing but passive obedience to any measure of taxation would be satisfactory.* That they afterwards, at their countless popular assemblies, but more especially in their public prints, used language both violent and licentious, can neither be denied nor defended; and the outrageous conduct of the populace was not only unjustifiable, but often highly indecorous. Nor were their bitter invectives against the British people, who long wished them success in *resisting* acts which were solely those of ministers, free from ingratitude.

In all countries, however, we meet with frequent examples of violent conduct among the populace, and in none more frequently than in England. It is, therefore, unjust to stigmatise a whole people, by charging them with what should only be considered the clamours of turbulent individuals.

The editors of their public prints were too often guilty of writing that which could only be intended to keep alive the passions of the vulgar; and such language as filled the greater portions of the American newspapers must certainly have disgusted men like Washington and Franklin. Violent commotions always attend measures that entirely change the constitution or rulers of a country; but the spirit, as well as the excesses of the American populace, throughout the struggle for independence, nearly resembled the vigorous determination and clamorous discontent of those who, with Oliver Cromwell, subverted the government of England; and the colonists were altogether guiltless of such atrocities as disgraced the first French Revolution.

In 1764, a bill was framed, laying heavy duties, payable into the British treasury, in specie, on all articles imported into the colonies from the French and other islands in the West Indies. Another act followed, restraining the currency of paper money. The injustice and absurdity of these laws excited fresh mur-

* At the beginning of the troubles of 1775, the united colonies offered to maintain their own civil list, and to give a clear contribution of 100,000*l.* per annum for 100 years, in aid of a sinking fund to pay the national debt of the mother country, with a proviso only of being treated like the other parts of the empire. The contumelious non-reception of the colonial agents by the ministry, prevented this liberal proposal from being formally made. The state papers, still on record, and drawn by Congress, are distinctly expressive of their sentiment to the above effect.—*Franklin's Miscellaneous Pieces*, p. 257. See also *Jefferson's Correspondence*. Franklin, on these proposals being rejected by the British government, went to Paris, and it was in consequence that the declaration of independence was so soon after proclaimed. At a later period the contumelious treatment of the agents from Canada, the Honourable Denis R. Viger and his colleagues, by the Secretary of State for the Colonies in 1834, had no little share in producing the spirit of revolt in the minds of the Canadians in 1836 and 1837—a spirit which Lord Stanley might have easily allayed, almost by ordinary courtesy and common sense.

murs. We do not deny that the excess of paper money formed a most pernicious evil, and, that its unsound character, was pregnant with all the mischief which was manifested in the depreciation of the paper called "*Continental Money*."

But how could the colonists pay duties in specie, when deprived of the means of obtaining it? Then followed, in 1765, Grenville's famous Stamp Act, which was the prelude to the most tremendous and destructive quarrel which had befallen Britain in the course of ages. This act was styled, the "folly of England, and ruin of America."

The colonists were now completely roused; but they, at the same time, conducted their measures with great wisdom, perseverance, and resolution. They united in a general opposition to the views of ministers, who disregarded their petitions and the statements of their agents; and, although some acts favourable to the commerce of the colonies were passed, the people became suspicious, and placed no reliance on the good-will of the British government. They especially mistrusted the king. Meetings were held, and resolutions were taken to make no further importations from Great Britain; and they, at the same time, encouraged to the utmost their own manufactures. So far did they persevere in this object, that they laid aside the use of elegances, and even abstained from eating lamb, in order to increase the growth of wool.

In England, this measure excited the general indignation of the manufacturers against the ministry.

The suspension of the trade with America, some time after, was followed by a resolution of the colonists not to allow the exportation of provisions; which was seriously injurious to our West India islands, and of severe consequence to the fisheries of Newfoundland. The Stamp Act was abolished in 1766, which is one among many other proofs of the rash folly of the ministers who passed it.

The opposition to the tea act, which was passed in 1767, and the resistance to the landing, and the throwing overboard, in December 1773, of the cargoes of the East India Company's ships, was another alarming proof of resolute determination on the part of the colonists. They had previously urged that, until their grievances were redressed no remittances should be made to England, nor any suit for debt allowed on the part of a resident of Great Britain. It was also threatened that the exportation of tobacco should be stopped; which, if carried into effect, would have cut off the immense revenue derived from its consumption in Great Britain, and the vast benefits gained by its re-exportation to other parts of Europe.

The Americans, in fact, could not possibly have persevered in measures to render the ruling powers of England more obnoxious to the people of Great Britain, or to attract the attention of all Europe more effectually than those they adopted.

The remonstrances made by the colonies against taxation were listened to by

the ruling powers only with anger and indignation; and ministers were equally chagrined and astonished to find that a great portion of the nation espoused the cause of America. But the government disregarded not only all opposition in Parliament, but the remonstrances of the colonists, and the numerous petitions from the principal towns in Britain; and madly proceeded in the prosecution of their impracticable schemes.* The fame and grandeur of Great Britain were, indeed, so great at this period, that it was never imagined the colonies would presume to dispute any measure dictated by ministers. The splendid triumphs of the British nation in all parts of the world had excited the jealousy of all Europe; and the idea of the colonies risking a trial of prowess with those armies and fleets which had defeated the combined strength of France and Spain, was considered presumptuous and visionary. It was, therefore, matter of astonishment to learn the extraordinary and resolute conduct of the Americans, in opposing the restrictions on their commerce, and the operation of the Stamp and Tea Acts. Nor should it be overlooked, by the statesman and law-giver, that from the period the minister was compelled to abandon the Stamp Act in 1766, the year after it was passed, until the cargoes of the tea ships were thrown overboard at Boston in December, 1773, included a period of seven years solemn resistance to arbitrary power. The British government were, at last, struck with alarm at the behaviour of the colonists, and determined to subdue them by force.

"The British colonies," it was contended, "had advantages which those of no other nation ever had." This was certainly true; and the liberality they had so long experienced, rendered the attempts at taxation, and the restrictions on their trade, the more obnoxious. Tithes and poor-rates were unknown; protection they always received; and they enjoyed another advantage, which they could only derive from England: this was the constant course of credit given them, without which they never could have risen to that extraordinary opulence which excited the admiration of Europe. "Would they relinquish these solid advantages, by increasing the displeasure of England, and disclaiming the authority of the parent state, and stand against the consequent peril?" It was also considered, "that the people of America, unacquainted with the intrigues that agitated the courts of Europe, and ignorant of the secret designs that were lurking in the cabinets of ministers, were incompetent to the business of preventing or conquering difficulties, or shunning danger." That no opinion could have been more egregiously wrong than this, was too truly exemplified in the talents of the great men who acted so conspicuous a part, during the revolutionary war, and in all their negotiations at and since that period.

* Mr. Henry, one of the American delegates, at the meeting of the Continental Congress said, during a debate on the Stamp Act, "Julius Cæsar had his Brutus; Charles the First his Cromwell; and George the Third——" here he was stopped by cries of treason, and then concluded by saying, "and George the Third—may profit by the example;—if this be treason, make the most of it."

CHAPTER VI.

EUROPE AND AMERICA DURING THE REVOLUTION.

It was a fact well known, that, from the time France lost Canada, secret intrigues were put in operation by that government, for the purpose of shaking the allegiance of the British American colonists. That they aided in effecting and carrying on the revolutionary war, is certain; but other causes, more powerful than all the address and assistance of France could bring about, governed the colonies, and enabled them finally to establish their independence.

The inhabitants of the four New England provinces were principally the descendants of those stubborn republicans, who fled from England to enjoy their own ideas of politics and religion. They retained the hatred of their ancestors to hereditary kingly authority, and the strongest aversion to any endowed hierarchy: especially to the Church of England. These people were the life and prime support of that opposition, which did not abate until America was lost to Great Britain.

The inhabitants of the other colonies, though numbers of them were of foreign extraction, were more moderate, but not less regardless of their civil and religious liberties. Some of them, it is true, were men of a licentious, audacious spirit, which was not to be awed by the deference due to civil authority; but the great majority, especially in Virginia and Maryland, were men of respectable rank and character, hitherto of a loyal turn, and warmly attached to the mother country.

In fact, the colonies were chiefly peopled with spirited, intelligent, and enterprising individuals, of all denominations, who, at the peace of 1763, were flushed with uncommon prosperity in their commercial pursuits, and by the brilliancy of their military achievements. Their disposition prepared them for great undertakings; and it was difficult to limit their hopes and expectations. It must, at the same time, be remembered, that they used all the means that ingenuity, guided by interest, and that wisdom, directed by truth, could suggest, in their remonstrances to the ruling powers, and in their petitions to the king and Parliament, before they assumed the language of defiance, or set up the standard of revolt.

But the monarch in his obstinacy, and ministers in their folly, still disregarded their representations, and treated their petitions with disdain; and a reconciliation was only, at last, seriously attempted, when the colonists had thoroughly committed themselves, as revolutionists, and gained those extraordinary advantages which insured their independence.

The debates in both Houses of Parliament on the state of America, during

the war, will probably never be excelled in splendid diction, powerful arguments, or persuasive eloquence. The language of the colonists, in their petitions to the king, in their appeals to the people of Britain, in their speeches in Congress, and in their separate assemblies, as well as in the pulpit orations of their preachers, was equally remarkable. They certainly did not, for a long time, wish for any thing more than a redress of grievances. The thoughts of independence were foreign to their feelings and their wishes.* “Place us,” said they, “in the same situation that we were in at the close of the last war, and our former harmony will be restored.”

On the shutting up of the port of Boston, which they considered as a prelude to the destruction of the commerce of other towns, they state, “We will endeavour, therefore, to live without trade, and recur for subsistence to the fertility of our soil, which will afford us all the necessaries and some of the conveniences of life.”

One of their delegates to the Continental Congress, in a famous speech, urging the necessity of their taking up arms, which was repeated all over America, and published in Europe, exhibited a strong specimen of the animation and force which governed the resolutions of the colonists. “The great God,” said he, “who is the searcher of all things, will witness for me, that I have spoken from the bottom and purity of my heart. It is an arduous consideration we are now upon; and surely we have considered it earnestly. I may think of every gentleman here as I know of myself. For seven years past this question has filled the day with anxious thoughts, and the night with care. The God to whom we appeal must judge us. If the grievances of which we complain did not come upon us unprovoked and unexpected, when our hearts were filled with respectful affection for our parent state, and with loyalty to our king, let slavery, the worst of human evils, be our portion. Nothing less than seven years of insulted complaints and reiterated wrongs could have shaken such rooted sentiments. Unhappily for us, submission and slavery are the same; and we have only the melancholy alternative left of resistance or of ruin.

“The last petition of the Congress to the king contained all that our unhappy situation could suggest. It represented our grievances, implored redress, and professed our readiness to contribute, for the general wants, to the utmost of our abilities, when constitutionally required.” After adverting to the unfortunate fate of that petition, and stating the necessity of taking up arms, he concluded in the following words:—“Our sufferings have been great—our endurance long; every effort of complaint and patience has been exhausted. Let us, there-

* When the crisis at length arrived which brought the Americans to abjure their allegiance to the crown of Great Britain, it is well known, that many who were most vigorously opposed to the measures of ministers, experienced the strongest feelings of affection for the country of their ancestors, when the sense of duty to the cause they engaged in, and to the land they lived in and obtained their subsistence from, influenced them to act contrary to the inclination of their hearts.

fore, consult only how we shall defend our liberties with dignity and success. Our parent state will then think us worthy of her, when she sees that, together with her liberty, we inherit her rigid resolution of maintaining it against all invaders. She calls us her children; let us, by the spiritedness of our behaviour, give her reason to pride herself in the relationship."

Every appeal and remonstrance being disregarded, the evil star of Britain gained the ascendancy, and ministers involved the country in a war that shook the vitals of both hemispheres.

The details of this eventful period, which has already filled many volumes, it is not within the object of this work to dwell upon. From the commencement of hostilities to the peace which acknowledged the independence of the United States, the energy, perseverance, and wisdom of the republican leaders, and the strange mixture of obstinacy, weakness, vacillation, and folly, of the British cabinet, which lost the nation the fairest portion of the empire, are equally extraordinary.*

Of all the measures of ministers, employing the Indians during this unnatural war was the most objectionable, or at least the most unwise, and revolting to humanity. The atrocity and cruelty of the savages exasperated the colonists beyond any former sense of injury, and thousands flocked in consequence to the standard of the States, who now, declaring themselves free and independent, abjured their allegiance to Great Britain.

It is the opinion of many that the conciliatory plan proposed by the Earl of Chatham would have saved America; but the famous bill, which he framed for that great purpose, was overthrown by a formidable ministerial majority. They went even so far, in order to give it a most marked and decided rejection, as not to let it even remain on the table. This must have been a severe mortification to so splendid a statesman—to a giant in legislation and government—whose abilities had raised the empire to an unexampled grandeur—who had directed the measures that wrested Louisburg and Quebec from France, and whose opinion and judgment had once been considered the oracle of the country.

The celebrated plan of Mr. Burke, supported by his eloquent and sound arguments, together with the appeals and remonstrances of the people of England and America, were equally disregarded; and New England, with all the southern states, convinced of unjust treatment, and fired with indignation, were animated with that determinate resistance and patriotism which finally accomplished their independence.

The assistance afforded the Americans by France, was from far different motives than those which are directed by a republican spirit, or by the virtuous admirations of either civil or religious freedom. Any attempt to abridge the

* It would almost seem reasonable to conclude, that the ministry were governed by feelings similar to those expressed by Dr. Johnson, when he said, "Sir, they are a race of convicts, and ought to be thankful for any thing we allow them short of hanging."

supremacy of an European government over her colonies, was any thing but agreeable to the ideas always entertained at the court of Versailles. On this occasion, their grand policy was to humble the power of Great Britain at home, by disintegrating her empire in America. The consequence, however mortifying to England, was disastrous and terrible to France ; and prepared combustibles which exploded in all the horrors of the Revolution, and opened a theatre for the splendid victories, the absolute despotism, and the final downfall of Napoleon.

The officers sent to America by France, carried back high revolutionary principles and feelings, which were afterwards ingrafted on the philosophy of Voltaire and the Academy. These materials soon unfolded themselves, by subverting the whole royal government and constitution, accompanied by outrages and calamities which shocked and disquieted all the nations of Europe and America.

In all Europe, the minds of men were predisposed to advocate the principles of liberty first promulgated by the French politicians.

The brilliant success of the American revolution had dazzled the gravest thinkers, and realised the visions of the most sanguine worshippers of freedom. The wise system of government adopted in, and so peculiarly adapted to the people, and to the natural condition of the Anglo-American republic, had satisfied all the rational and prudent, unless it were the few who possessed hereditary power and special privileges in church, state, and person.

Liberty, in truth, is so undeniably the birthright of mankind—so evidently the natural free gift of Heaven, that not only all who have never known its blessings, but even those who have scarcely a hope ever to enjoy its possession, will, when the sacred principles of freedom are once advocated by a people, earnestly pray for the success of those who have courage to assert this common right of all men.

The very idea of public freedom is so endearing to the human bosom, that whenever the people solemnly, and with fearless determination, as the Americans did, take up arms either to defend or to recover their rights, they are certain of the open applause of all who dare express it, and the secret approbation of those by whom its avowal is suppressed by arbitrary power.

Combating, with honest patriotism, for freedom, those who hazard their lives and fortunes are the champions of mankind, fighting for the universal benefit of society. The predilections of all who behold the strife, are engaged in their behalf, and tyrants with their supporters become objects of scorn and hatred.

The Americans declared, "that when, in the course of human events, it became necessary for one people to dissolve the political bonds which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God en-

titled them, a decent respect to the opinions of mankind, required that they should declare the causes which led to their separation.

“That they held these truths to be self-evident; that all men are created *equal*—that they are endowed by the *Creator with certain unalienable rights**—that among these are *life, liberty, and the pursuit of happiness*—that to secure these rights, *governments* are instituted among men, deriving *their powers* from the consent of *the governed*—that whenever any form of government becomes destructive to these ends, it is the right of the people to *alter*, or to *abolish it*, and to institute a new government, laying its foundation on such principles, and organising its power in such forms, as to them shall seem most likely to secure their safety and happiness.”

The Americans carried into wise execution the determination thus so rationally and so intrepidly declared. The orgies and atrocities of the French revolutionists were celebrated and perpetrated in the name of *liberty* and *reason*. Horrible profanation! The *visionaries* of a revolution, grounded on what was termed Philosophy, was not confined to France. The Parisian philosophers had servile imitators: at the head of whom was the freethinker of *Sans Souci*, surrounded by his Gallic adulators. Those philosophers had, before the revolution broke out in Paris, created in Europe the habit of scoffing at religion, and at the superstitious evils of Christianity. Frederick, although in government a despot, was, after Voltaire, the very prince of those men who persuaded themselves, and endeavoured to convince the world, that all social evils and religious absurdities sprang from Christianity alone, without ever seeming to consider that the passion for power and wealth, in the strong and crafty, and the fears and superstitions of the weak and ignorant, were the causes to which the evils they denounced and ridiculed, were to be attributed; and which might be based with equal results upon the Hindoo, Hebrew, Mahomedan, or any other religion, having in its organisation, that most awful auxiliary and support of tyranny, the government and power of a mighty hierarchy.

To these opinions of religion, the speculative politicians added, that all our administrative abuses, and the consequent evils which harassed society, were to be attributed to established governments: this accusation was not easily to be disputed; although those who held the power of ruling states were far more to be condemned than the particular forms of government. To destroy Christianity, and the existing systems of nations, was, therefore, the expedient proposed by the speculative politicians of the French revolutionary school, as the only *panacea* to heal all social maladies.

In England, where the power of the sovereign could be exercised to an arbitrary extent, through his ministers and a parliament, the majority of the members

* The unfortunate black mixed race are, however, denied the benefit of these blessings.

of which, before the Reform Bill could be elected by corruption, the spirit of revolution made little progress. But the principles of civil rights have advanced on solid and successful foundations. The liberty of the press, that "palladium of all our civil and political and religious rights," was (except in Scotland) secured by the trial by jury. It is at the same time remarkable that in no Christian country in the world does the freedom of the press, or civil liberty exist, except in the United Kingdom, and in Anglo-America and the British colonies; that is to say, wherever the English language is spoken. There is no liberty of the press, that is, in its true sense, in any German, Russian, Austrian, Italian, Slavonian, Spanish, Portuguese, Dutch, Belgian, Danish, or Swedish country. In France, after two revolutions, and more bloodshed, in the name of liberty, than in any country in the world, the press is thoroughly fettered by the government, and a newspaper cannot be printed, until an enormous sum of money is deposited with the government, to pay the fines which may be inflicted on its editor by the tribunals. No French citizen, or foreigner, can move in, or out of, or over, France without a written licence, or permission, to do so from the police. If a minister of religion attempts to preach, or, if a place of worship is opened without a licence, the first is liable to a penalty, the latter to be closed by the police. The freedom of assembling in public, or private, meetings, is prohibited by the infamous laws of September, 1834—laws which Berryer with truth said, "put into execution the ordonnances of Charles X." The representative system is so limited, by the high money rate, in direct taxation, required to be paid to qualify electors, as to amount to mockery of the whole population. In short, although there may be civil, military, and legislative equality for all before the tribunals, and equality for all rich enough to qualify for electors, civil liberty does not exist in France. We may extend the same remarks, with more or less severity, to every state in Europe; Norway and Switzerland forming a modified exception.

England, at the peace of 1783, notwithstanding the heavy debt incurred by war, was still in a powerful condition. Her arms, except on the continent of America, were triumphant in all parts of the world; and, although the treaty, by which England acknowledged the independence of the United States, was at that time considered the termination of British grandeur, the prophecy has happily proved false. Great Britain, notwithstanding the unexampled expenses of two long wars, possessed at that period greater resources than any power on earth; and the ministers whose imbecility and perverseness lost America, were supplanted in the royal councils by men of ability and spirit. England, it was true, had lost many of her American possessions, but she still retained others in the East and West Indies, and in North America: probably the most important to her as an empire.

CHAPTER VII.

CONDITION OF THE UNITED STATES AT THE PEACE OF 1783.—WASHINGTON.—
CONSTITUTION AND LAWS.—RESOURCES.

AT the general peace of 1783, the condition of the United States of America, and the durability of the constitution which they adopted, formed a subject which gave rise to a multiplicity of speculative opinions, most of which experience has since proved erroneous.

But the crisis of American revolt brought forward men, or rather brought their abilities into action, who may well rank in history above the celebrated heroes and statesmen of ancient, and, with the Hampdens, of modern times. Those colonial patriots gave life and strength to the war: directed the councils with firmness and wisdom;—organised armies and provided funds to maintain them, planned a just and economical system of finance, and, after solemnly declaring their independence, drew up and adopted a practical constitution, agreeable to the habits and dispositions of the people.

It was contended, that when the colonies became independent, they would, from their comparative weakness, lose the respect of foreign nations; that when left to themselves, and not controlled by the mother country, or awed by foreign powers, their energies would relax; and that civil dissensions would divide them and subvert a constitution, which, according to its form and the experience of mankind in all ages, must inevitably fall.

The condition of America was, however, very different from all the republics that had previously existed, either in ancient or modern times. The people were generally intelligent, their habits frugal and industrious, and unlike the Europeans of Spanish America, their ideas were free from the thralldom of religious intolerance. The great men who conducted their assemblies possessed abilities, solid rather than brilliant, practical rather than theoretical; and they had the good sense and discrimination, notwithstanding their separation from the government of the mother country, to adopt the constitution and laws of the then most free government on earth, as the groundwork of theirs: making a royal and hereditary chief magistrate, a privileged legislative nobility, and an endowed national church, the exceptions of any consequence. Their immense territory, extending along a vast length of sea-coast, abounding with numerous harbours, rivers, woods, fisheries, minerals, rich soils, and almost every climate under heaven, placed all natural advantages in their immediate possession. They enjoyed also, the benefit of all the knowledge and literature of England, without the labour of translating the language, or paying for the copyright of books; and they had the earliest advantage of our discoveries in the arts, without restrictions as to the

right of patents. They had, in short, the knowledge and experience of all ages and countries to guide them, without being shackled by hereditary rights or established usage.

With such extraordinary advantages, as no other people ever possessed, they were enabled to avoid most of the blunders committed by nations, the government and laws of which, originating with the feudal ages, and acquiring their elements and power during centuries of bigotry, intolerance, and tyranny, down to periods of liberality and intelligence, were consequently confused, and generally incompatible with equal justice and personal liberty. The Anglo-Americans had, also, the peculiar good fortune, at that period, of being directed by honest men.

Of these personages, the most distinguished was George Washington. He was appointed to the chief command of the army, solely on account of his personal merit and military abilities. He had served as an officer, in the former war against France, with much well-earned distinction. At the peace, he retired to his patrimonial estate, where he lived as a respectable private gentleman, endeared to all who knew him, by his amiable character, and unostentatious hospitality, until chosen supreme commander of the American army. During the war, his whole heart and ability were honourably devoted to the great charge which he undertook; and, when he was afterwards elected President of the United States, his policy was disinterested, liberal, just, and moderate. Truth and utility were the great objects which he had always in view. The powers of his understanding were solid, but not brilliant:—wise judgment was his *forte*; although the judgment of Franklin was more profound. In his deliberations, neither passion, prejudice, party spirit, nor interest, had any weight; and his decisions, influenced by a good heart and wise head, were, with one or two exceptions, always sound and judicious. On many great occasions, which involved the fate of the country and the army, his clear perception and power of judgment alone saved both.

In private life he appeared as amiable and good, as he was great and sublime in the exercise of sovereign power or military command. He was, besides, a respectable gentleman of the old school, and retained the observances and dignity at his levees which he witnessed in early life under the British government. This dignity was, however, characterised by courteous simplicity, and a demeanour which always impressed the observer, with a conviction, of the rectitude, and the feelings of justice which dwelt prominently in the heart of Washington. The high example of his own character, particularly in private life, gave a high moral tone to public manners.

We must not, however, forget, that his contemporaries who became his successors are considered to rank among great men; particularly Mr. Jefferson and Mr. Madison: but it must, at the same time, be admitted, that they com-

mitted many egregious blunders in their commercial policy; and that the last war with England was not only rash, but impolitic, and scarcely provoked. Of the contemporaries of Washington, Benjamin Franklin, the writers of the *Federalist*, Hamilton, Madison, and Jay, and other leaders, may well be ranked with the highest order of human intellect. In Jefferson, who drew up the Declaration of Independence, genius and splendid abilities were prominent characters; but his powers of judgment were far beneath those of Washington and Franklin, Jefferson was the very prince of democracy, but, the love of truth and justice was by no means so thoroughly ingrained in the philosopher of Monticello as in the patriot of Mount Vernon. Of the good men, the patriots of unsullied integrity, of less splendour of character, but of the first order of men of business, we must not forget John Hancock, the President of the Continental Congress.

It has been popular, and even fashionable, in Europe, to think lightly of the Anglo-Americans. Both French and English travellers, influenced by early prejudices, associations, and customs, have seldom done justice either to the people or to the country. To form a just estimation of both, we must comprehend the great resources of that vast region, and examine the intellectual and physical energies of the people;—we must ask, what have the people done since they became an independent nation? and not measure their capabilities, or stamp their character, by frivolous peculiarities of language, or habits, that have differed from ours merely through the agency of local circumstances. These may afford materials, to a strolling comedian, for exciting vulgar merriment; but it is certainly unworthy the attention, and beneath the dignity of a respectable traveller, to fill his journals with the *cant* language and provincialisms of individuals, whom he may accidentally meet with in a stage-coach or at an inn. Neither are we to overlook the fact that Europe and the British Islands are annually sending forth to the great American republic at the rate of nearly a million of emigrants every ten years; and, we are, in justice, bound to say that the inundation of human beings from Europe, consists, generally, of an accession which diminishes far more than it adds to the morals of America.

There are, we admit, dark shades in the character of some of the states of the republic, and we are prepared to denounce especially one of her domestic institutions, **SLAVERY**—an institution the most dangerous to the peace and safety of the Southern States. But as we never can justify any interference, on the part of one nation with the internal affairs of another, we consider it not only unwise, but unjust, either for England or any other country to meddle directly, or indirectly, with the *domestic institution of slavery* in the United States of America. We assuredly consider it a most hideous and abominable institution; England was cursed with its injustice and disgrace, until within a few years: we are no longer diseased with its rottenness; but still, we must allow America to manage her own domestic concerns. No Englishman would ever consent to any foreign state med-

dling with ours, however much we may be convinced of having many "beams in our own eyes," which ought to be removed. Nor are we blind to the difficulty attending, and consequent, upon emancipating the slaves of the republic,—even if their proprietors were both willing, and able, to grant them unconditional emancipation. We believe the philosophers, and statesmen, of Europe, would be thoroughly perplexed as to the policy which they would pursue towards three or four millions of human beings, without any education, and with no training in the habits, duties, and thoughts, necessary for a self-providing and self-maintaining society.

In regard to the education of the young generation, and to literary and benevolent institutions, America has done much that she may justly be proud of; and many of her scientific publications are of that high character, which the first nations in the world might well feel honoured in having produced.

The democratic form of the American government arose, perhaps, as much from necessity as from any predilection which the leading men of the time cherished for it. There was no one who could assume a claim to sovereign right, and the wealth of the country was too equally divided, to give any one person an overwhelming share of power. Washington, Hancock, Franklin, Jefferson, Adams, Maddison, indeed all the distinguished men and heroes of the revolution, were well aware of this circumstance; and they were all too honest, and patriotic, to allow ambition, or the love of power, to interfere with the real interests of the nation.

The constitution and laws were, however, accommodated as nearly as possible to the former mode of administering the government.

The different States retained their respective representative governments, much the same as before the revolution, with the power of passing laws for their internal administration; but all the States were united under one general federal government.*—(*See the Constitution of the United States, and of each respective State in the Supplement to this Volume.*)

The federal head or supreme government was formed of three branches or estates: the President, the Senate, and the House of Representatives. All elected by the people.

The constitution was not inconsiderately, or quickly adopted. On the 13th of September, 1787, thirteen years after the meeting of the first continental congress, nine after the declaration of independence, and four after the acknowledgment of that independence by England, the constitution was agreed to and adopted. Twelve articles of amendment, or rather additions, were afterwards made in 1791, 1798, and 1804. The problem for experience to solve was, whether this form of

* It is usually believed, that the first Congress which assembled in America, was on occasion of the troubles that brought on the war of independence. A Congress was, however, held half a century before, and occasionally afterwards, for the purpose chiefly of planning measures to defend the frontiers against the Indians. In 1754, a Congress met, under the suggestions made by the Lords Commissioners for Trade and Plantations, in order to consider the best means of defending the colonies against the French.

government possessed within its attributes the power of carrying into practical execution, with due obedience from the citizens, the laws which are necessary for the security of person and property, for the defence of the country, and for the orderly maintenance of civil and religious liberty.

There is no national church in the United States: much is argued for and against this circumstance, and some may regret the want of a church, countenanced as a standard of faith by the constitution; but in all matters where the conscience of man should alone control his belief, we must admit that the framers of the constitution, and of the government, of that country, acted wisely in not interfering with religious matters.

Baptists and Methodists are considered to be the most numerous denomination of Christians; then follow the Congregationalists, who have the service of the Church of England, cleared of the *repetitions* and doctrines obnoxious to Puritans Unitarians, Quakers, Catholics, Independents, Presbyterians, &c.: indeed, all Christian sects that we know of, and that apparently mad sect, the Mormons, are met with in the United States. Government recognises none; nor are any liable to political disabilities on the score of religion.

There is more general knowledge diffused among the people of the United States than in any kingdom in Europe. Yet there is not among them the same proportion of men celebrated in literature and science as in many other countries. The Americans are a young, active, and enterprising people. General knowledge and practical education are absolutely necessary, in order to follow their adventurous pursuits. The citizens of the United States are, excepting those who are incessantly engaged in pursuits of which gain is chiefly the object, a more reading people than those of England; but they seldom have leisure to apply themselves to the tedious labours of literature and science. Of those distinguished men who have entered the avenues of literature, and the labyrinths of science and art, America may most justly boast. As historians, philosophers, jurists, and divines,—in poetry and romance, painting, and even in sculpture, we find learning, profundity, and genius, as conspicuous as in Europe. The only remarkable difference is, that the number of those who devote their lives to learning, art, and science, is, from circumstances, inseparable from a new country, less in proportion to the whole people than in Europe: always excepting Russia, Turkey, Spain, and Portugal.

The institutions of the United States are deserving of the utmost attention, on the part of those who would improve their own, and, in some respects, in avoiding blunders when establishing new ones.

The colleges, and other seminaries of learning, in the United States, are respectable and numerous, and the diffusion of knowledge extensive and liberal. This is especially remarkable in the States of New England and New York.—(See Supplement to this Volume, and Statistics of the United States in the second volume.)

There are many hundreds of newspapers circulated daily throughout the United States, besides reviews, and a vast number of magazines. The quarterly reviews, and the journals of science, are productions of very great merit. Nearly all the popular works published in England, and some imported from France, Belgium, and Germany, are reprinted with astonishing celerity, and dispersed all over the republic. Some of the most expensive scientific works have also been republished in the United States. Among others the celebrated *Mécanique Céleste* of La Place appeared first in America,—in a form which does it full honour—in the English language:—translated and published at his own expense, by Nathaniel Bowditch,—one of those self-taught indomitable intellects, who are superior to adversity.

That which distinguishes the Anglo-Americans from most other people, is their sleepless spirit of enterprise; which, grave people as they are, is often reckless, though calculating, in its undertaking. To every part of their own country, where any gain can be acquired, and, in their ships, to every part of the habitable globe, do they resort. This character of them as a nation has, however far it may be accompanied by some unamiable defections, been the great cause of their prosperity, both before and since the revolution; and, according to all probability, and experience, it will continue until their gigantic territory has a superabundant population, or until great individual wealth, and consequent luxury, produce the usual effects caused by indolence, voluptuousness, and degeneracy. This ultimate possibility is so very remote, as practically to preclude even the *Ideal of finality*. The *Anglo-American* will go forward in his progress.*

The cool indifference, but calculating determination, with which he moves from the seaboard, or the old states, to the back countries, where he can secure plenty of land for his children to settle around him, is remarkable. Nothing, however, is more common. A whole colony sometimes depart together; and, on arriving at the spot in the wilderness that answers their views, immediately commence the operations of cutting down the trees, and erecting houses; and a town, with its streets, and all the component parts of an American embryo settlement, such as a meeting-house, blacksmith's forge, saw-mill, corn-mill, shops, and taverns, appear on the banks of a river or stream, where a forest occupied the ground a few months before.—(See the Geographical and Statistical chapters,

* It is not a little remarkable how thinking, educated statesmen, even those who are the apostles of legitimate absolute monarchy, entertain similar opinions as to the progress of mankind.

Prince Metternich, in speaking confidentially to a German diplomatist, of the *bleiben wir beim alten* (hold fast to the old) class, on the subject of arresting the progress of enlightened ideas, said, "*Le temps avance, au milieu des orages, vouloir arrêter son impétuosité serait un vain effort.*"*

The famous expression of the Abbé de Pradt, is equally true, "*Le genre humain est en marche, rien ne le fera retrograder;*" literally, "Mankind is on the advance or march, nothing can make this *march* retrograde."

* "The *Times* advance in the midst of storms; to attempt arresting its *impetuosity* would be a vain effort." By the *Times* Prince Metternich personified the HUMAN MIND in its intellectual progress.

vol. ii. of this work.) In this great fact, is involved the whole secret cause, the effect of which, will overwhelm the whole hemisphere, from Hudson Bay to Terra del Fuego, with the domination of the English language. This is no prophecy. It is a clear daylight forecast of that not to be arrested progress which is the inevitable destiny of America.

CHAPTER VIII.

CHARACTERISTICS OF THE ANGLO-AMERICANS.

It is remarked by almost all travellers, that the Anglo-Americans are perpetually boasting of the excellence of their constitution. This is certainly the case, and prejudiced Englishmen may not like to hear it. Yet we boast of ours; and why not let the citizens of the United States, if they find themselves happy and blessed under their republican form of government, enjoy its full benefit, whether real or imaginary? At furthest, we can only make it a charge of very pardonable national vanity, which we ought to esteem rather than blame them for.

As to the state of society and the manners of the people of the United States, we must not, although there are no titles, believe that there is no distinction of ranks, and that the people live on a perfect footing of equality. There is, in fact, tacitly formed, in American society, a greater discrimination of classes, than the lines of demarcation, marked out by the hereditary titles of our English aristocracy. Wealth and knowledge, which, together, form power in all countries, constitute what, in a moral point, may be termed the aristocratic ranks of America. Those who form the first rank consist of the respectable families of the talented men, who figured in the revolutionary war; the leading men of Congress, and of public departments; gentlemen of the learned professions; merchants of education and property; and all others of wealth and respectable character and talents. These people, all over the United States, naturally associate with each other, and as naturally avoid mixing with the next class, which consists of small tradesmen, shopkeepers, tavern-keepers, and others of much the same standing. These, again, shun domestic or family intercourse with those in fortune and position beneath them. Exceptions to this general observation are, however, not unfrequent.

As to the manners of the Anglo-Americans, no one can detail justly, by common remarks, their characteristics. The materials are as heterogeneous as can be well imagined, but, at the same time, greatly modified by circumstances. In general, but especially in the New England States, the men are graver, and, as respects language and carriage, more precise than in Europe. The Virginians have been compared to country squires in England.

The United States, being peopled at first by persons who left these kingdoms

when public manners were very different from what they are now, and since that time, annually, by the adventurous of all classes from other parts of Europe, the inhabitants must retain much of the original habits and education of their ancestors. Time alone will amalgamate these materials, and create a standard which will eventually give a more marked tone to public and private society. But in this progress, and intercourse, the steam-engine, the press, steam navigation, the railroad, and general commerce, will be advancing the civilisation, and the assimilation, of all nations. The country people of America are blunt, but certainly civil, although often accused of rudeness. We feel safe in considering them not so rude, and certainly not so ignorant, as the peasantry of England, nor the *bourgeoisie* of France. They are never obsequious, it is true; and this arises from their being usually independent in their circumstances. They are, in short, neither polite nor rude, but always civil, unless we assume an authoritative tone: if we do, as some Englishmen are accustomed to do, through habit, without meaning any assumption, the Anglo-Americans will certainly neither comply with our requests, nor reply to us in any thing like gentleness of spirit.

The impertinent curiosity with which the people of America are branded, must be considered only applicable to the remote settlements.

European travellers form their opinion of society in America, not from a knowledge of the great mass of the people, but from the characteristics of the towns, and of steamboat and railway travellers, and of political adventurers and reckless speculators. No data can be more erroneous. The people of America must be judged in their dwellings; and it will then be evident that of the so-termed *genuine people* of America, the majority—especially in the northern states, and including New Jersey, Pennsylvania, and New York, consists of the *agricultural families*, and the inhabitants of villages and small towns. We have with careful impartiality examined the condition and character of this great class of the population, as it exists chiefly in the non-slaveholding states, and in the British North American colonies; and Mrs. Grant's description long ago of Albany will still apply to countless villages in America. Albany, it is true, is now the busy centre of enterprising commerce. Steamboats, canals, and railroads, bring thither all kinds of raw and manufactured commodities,—all sorts of speculators,—all varieties of travellers. It is, indeed, no longer Mrs. Grant's rural town, with a garden and trees surrounding each of its neat white houses,—with its family group in summer evenings, or clear moonlight, seated beneath the shade of open portico, or spreading tree,—with the family cow, fed in the common pasture, returning home at eve, with its tinkling bell, along the broad grassy street, to be milked at its owner's door,—with inhabitants, *not one* of whom was very rich,—very poor,—very knowing,—very ignorant,—very wise,—or very polished. But still all these real blessings, this rural happiness, abound in the United States.

In the rural districts of the New England States, Vermont, New York, and Pennsylvania, and of the British provinces, we have found it not uncommon, wherever good inns did not exist, to ride or drive up to some large farm-house ; in which the landlady, or landlord, almost invariably receives the traveller with the kindest hospitality.

We can aver that far and wide as we have traversed the face of the earth, we have not discovered, not even in England, so much comfort, happiness, virtue, independence, and useful intelligence *joined together*, as among the beautiful villages and farm-houses of the highly-cultivated agricultural districts of the northern states, and of many parts of Nova Scotia, New Brunswick, and Lower and Upper Canada. The condition of the Canadians of French race we have described in a previous chapter ; and the real moral and physical power of the American republic, is assuredly to be found in the healthy farming population of the non-slaveholding states. The farm-houses that we have visited and lodged in, abounded with every convenience and domestic comfort. Every thing appeared in its proper place, —every thing to have been done in its proper time,—every thing to have been applied to its proper use.

Here the best parlour, in the substantial New England and New York farm-house, exhibits

“ The *whitewash'd* wall, the nicely *furish'd* floor,
The *varnish'd* clock that tick'd behind the door,
The pictures placed for ornament and use,
Poor Richard's rules to enjoy, not to abuse,
The hearth, except when winter chill'd the day,
With *cedar boughs*, and flowers, both wild and gay.”

Plain useful furniture, a mahogany-framed looking-glass, a case of shelves, with theological, historical, and several other entertaining, but no profane books. A table, usually covered with green baize, on which is often placed the family Bible, illustrated, covered, for its protection, over the binding with baize, or tanned calf-skin ; and a chimney-piece, also adorned with china or other ornaments. The sleeping rooms are uniformly clean, and the beds good. The large kitchen is often a cheerful resort of children young and grown up, and always presents the utmost cleanliness, with the utensils always appropriate, and in order. In the porch, an important wing or projection, several implements are usually hung, in order, on its walls. The dairies are as clean and as sweet as if the mistress of the house, and her fair maiden daughters, attended to nothing else. We who have visited the dairies of North Holland, feel the impression that the old Dutch settlers must have transmitted the virtue of clean neat *dairies* to their descendants, and, by example, to all the farming wives of New York, and its neighbouring states.

Attached to the farm-house there is frequently a work-room, or domestic manufactory, for carding and spinning, and weaving : in which the women employ themselves during the appropriated time, and which, with household management, form their chief thrifty occupation ; for in America the wives and daughters of the rural class are never, or, as far as we have observed, scarcely ever, subjected, as the women in France, Belgium, and Germany are, to field

labour in all weathers—except it be for a few days while gathering the hay and corn harvest. To this circumstance, as well as to race, is attributed the remarkable beauty of the young women in the agricultural districts, especially of the northern states.

The barn, the stables, the cattle-houses, the agricultural instruments and implements, are almost invariably in keeping with the system of order which prevails in the domestic household. The horses are generally very strong and useful, if not always, noble, sleek animals. The oxen and cows well reared, and the breed useful in every respect. The sheep are taken good care of;—the breed not always the best for wool, although usually excellent for mutton. The swine are generally too large, and too fat, for tender pork; but of that quality which finds the most ready market for the use of the fishermen and other seamen.

The poultry is usually very fine, and the farm-yards often send forth a magnificent show of turkeys.

On passing along the roads, or over the fields, the wheat, the Indian corn, the oats, the potato, the clover, and other grass crops,—the apple, peach, and plum orchards,—the growth of pumpkins, melons, and culinary vegetables of all sorts, the stone-fruits, &c., all proclaim the fertility of the soil and considerable skill in husbandry.

The common-sense intelligence of the farming classes, and the usual excellent moral character of the landlords of the hotels, who are also often farmers, of the localities east of the Hudson, and west until the traveller approaches the border population towards the Canadian frontiers, constitute them, in truth, what the American may well term the “*genuine people*.”

We occasionally observe a lazy talking *Rip Van Winkle*, with an ill-ordered house and a family out of the usual decent and comfortable keeping; but they are, indeed, rare.

No village or any settlement is without its school, and although the institutions for the higher branches of education are numerous, and provided for in the northern states, and in all, except for slaves, or coloured people, yet the country school, and the learning of the country schoolmaster, resemble still more those pictured by Goldsmith—

“ There, in his noisy mansion skilled to rule,
The village master taught his little school,
The village all declared how much he knew;
’Twas certain he could write and cypher too;
Lands he could measure, terms and tides presage,
And even the story ran that he could guage.”

As labour closes the week, the evening of Saturday is the commencement of the Sabbath, and we may generally find its observance in harmony with the spirit which lends simplicity and piety to the “*Cotter’s Saturday Night*” of Burns, although the condition of the agricultural population of the country is far different to that which was once the lot of the poor, yet worthy, cotters, whom the Scottish bard has immortalised.

On the afternoon of Saturday, there is always to be observed more than usual preparation about and within every well-managed farm-house. The business of the week is contrived to be finished at an early hour; and, whatever is necessary to prevent any labour on the Sabbath is strictly attended to.

After supper, the chapter is read from the family Bible, the psalm or hymn is sung by the whole household, and the father closes the devotion by prayer; after which all retire to rest.

When the Sunday morning breaks forth, there is none of the busy week-day industry and thrift. Man and beast have ceased their labours,—all is peaceful and calm. Not a sound is heard. Within the houses they rise a little later than usual; all wash, and dress in their neatest Sunday clothes. All the members of the household are assembled to hear a chapter read, and to sing a hymn or psalm: the father, or one of the family, prays aloud for all, immediately after which all breakfast together at the same table.

Soon after the church, or meeting-house, invites all to public worship; and, simultaneously, the minister, his family, the squire, the doctor, and all the neighbouring farmers, and other inhabitants, proceed, decorously and independently, all feeling equality of condition and purpose, and, in suppressed converse, to the house of prayer. Those who are at some distance come, with their decently clad wives, and blooming, virtuous daughters, during summer in a one or two-horse waggon, and in winter in a sledge or carriage, to the church or meeting-house.

Miss Sedgewick, an American writer, whose descriptions are always good, because true, describes very prettily the farmers in the rural districts repairing to church, and the close of the Sabbath. "The farm's ample waggon," says this excellent authoress, "and the little one-horse vehicle, bring in all who reside at an inconvenient walking distance: that is to say, in our riding community, half a mile from the church. It is a pleasing sight to those who love to note the happy peculiarities of their own lands, to see the farmers' daughters, blooming, intelligent, well-bred, pouring out of these homely coaches, with their nice white gowns, pruned shoes, Leghorn hats, fans, and parasols, and the spruce young men, with their plaited ruffles, blue coats, and yellow buttons. The whole community meet as one religious family, to offer their devotions at the common altar. If there is an outlaw from the society—a luckless wight, whose vagrant taste has never been subdued—he may be seen stealing along the margin of some little brook, far away from the condemning observations and troublesome admonitions of his fellows.

"Towards the close of the day, or (to borrow a phrase descriptive of his feelings who first used it) when the Sabbath begins to *abate*, the children cluster about the windows. Their eyes wander from their catechisms to the western sky; and, though it seems to them as if the sun would never disappear, his broad disc

does slowly sink behind the mountain; and, while his last ray still lingers on the eastern summits, merry voices break forth, and the ground resounds with bounding footsteps. The *village belle* arrays herself for her twilight walk; the boys gather on 'the green;' the lads and girls throng to the 'singing school;' while some coy maiden lingers at home, awaiting her expected suitor; and all enter upon the pleasures of the evening with as keen a relish as if the day had been a preparatory penance."

On the morning of Monday, the whole population resume their several avocations with order and good will. Nothing like the indolence and disinclination to labour, which prevail among the artisans and working-people of cities, on the morning of the day which succeeds the Sabbath, is to be observed in the agricultural districts of America; while, in the large cities, a great part of Monday is idled way, in the term *sobering off*, as is frequently the case in London and Paris, the effects of dissipation on the Sunday.

We must not omit to remark that the farmers of the New England states, of New York, and Pennsylvania, are all tolerably well instructed; that is, there is scarcely one of those born in the country, who cannot read, write, and understand the several rules of arithmetic; and most of them have also read the history of England and of the United States, newspapers, monthly periodicals, and agricultural books or tracts. Practically also, they are far more skilful, and inventive in various matters, than the farmers of any other country; though as mere farmers they may not excel, or be, in general, equal to the best of Europe.

Besides the usual routine of husbandry, they frequently, in workshops attached to most farm-houses, make their own ploughs, harrows, carts, waggons, and minor agricultural implements, and with the assistance of their families and hired servants, or helps, construct their dwellings as well as outhouses.

In the western states, the agricultural settlements in Ohio, Illinois, Indiana, and Michigan, when they are so far subjected to improvement, and so extended as to be cultivated in the same manner as in the older states, we find similar characteristics among the rural population. We often discover this, though not generally, even in the slave-holding states of Virginia, Delaware, Maryland, Tennessee, and Kentucky. In the wild west, the pioneer, and the backwoodsman,—the hunter, and trapper, are all characterised by the habits, manners, and morals, of a bold, daring, and hardy life, which is modelled by local circumstances and pursuits, amidst the vast wilderness of prairie, forests, and waters. The traveller who would sketch American manners, during a steamboat voyage down Mississippi to New Orleans, will draw a very different picture, of the *Anglo-Americans*, from that of the rural inhabitants, which we have endeavoured to describe. Multitudes of German, and Irish, emigrants are added annually to the citizens, and, even to an extraordinary degree, influence the elections, of the United States. Those, also, who navigate the canals, rivers, and lakes, are characterised by the habits of their occupations; and inherent and local circumstances,

cause a very marked difference between the citizens of Boston, New York, Philadelphia, Baltimore, Charleston, New Orleans, Pittsburg, Cincinnati, Louisville, St. Louis, Buffalo, and Detroit.

In speaking of the rural population, we have alluded to their characteristics north only, until we approached the woodland frontiers of Canada, where they assume very strikingly different habits and morals. Not but that a great proportion of the inhabitants, near and on each side of the boundaries of the United States, and British possessions, consist of honest, industrious, and praiseworthy families ; but there is in the general character of borderers, in all countries, less morality, less honesty, greater recklessness, and more cunning and plotting, than exist among the other population.

This is remarkably the case in respect to the borderers, on each side the line, dividing British from republican America. The immoral and dishonest of all grades, and the most unprincipled schemers of the former, escape or resort to the latter, and those of the latter to the former. Smuggling is one great nursery of dishonesty and scheming. Failures in trade, or in timber or land speculations, and then cheating creditors, is another. The swindlers and political demagogues of Canada, evade the laws by passing over to the American side of the line, and cry out, " Here we have liberty—in Canada you are in bondage ! Have an independent government !—shake off British tyranny !—govern yourselves !"

These men, who call themselves PATRIOTS, have agitated Canada, generally, from vanity, from recklessness, and for evil purposes. The American border demagogues echo and re-echo their *catchwords*—this is called *sympathy* on the part of the American people. It is no such thing. It is mere speculation on the part of a few hundreds, of the most unprincipled and desperate characters on earth, who look forward, in the event of a successful rebellion, to the vacant lands and trade of Canada, as a field for adventure and plunder.

Many of the Upper Canadians are disloyal and worthless men ; made up, *first*, of men whose villany was too notorious to allow them shelter in the United States ; *second*, of runaway debtors, and cheats of various shades, from the United Kingdom, and from the other British possessions ; and, *third*, of disorderly persons, born and brought up in the province, who have, generally, passed their time as lumberers, raftsmen, and boatmen,—in drinking, or in scheming to live without working ; and the *fourth*, that is, the mere *political demagogues*. These classes, the so-styled PATRIOTS of Upper Canada, with whom sympathised, during the late rebellion, not the United States citizens who form the many, but the unprincipled and reckless among the borderers, who constitute the few.

In the Canadas the great majority consists of those who are loyal, from principle and feeling to the British government,—and who, though they may not be insensible to abuses, which the executive, especially the former council, maintained, have considered these *official evils* of only the most unimportant nature, when compared to the protection and many blessings which they enjoy. The

most ardent and courageous of these loyalists are found among the emigrant families and their children of the clans of Glengary and Mac Nab, the emigrants extirpated from Sutherlandshire and Lord Reay's country, and others, who still breathe the spirit of the Highland clanship; who still make the woods, rocks, and mountains, resound to the pibroch's wild martial strains; and who still animate their firesides with the Gaelic tales, the airs, and songs, and reels, and Highland dances of yore. They are not, however, either the most industrious nor the most thriving; and notwithstanding all the charms of Celtic song, legend, and story, Highland habits are unsuited to the age, and the Celtic tongues must vanish as a spoken language in the New World, as it must in Scotland, Ireland, and in Wales. However much we admire its antiquity, it is unsuited to civilisation, and to the skilful industry which a new state of things have created as necessary to escape the periodical evils of poverty and famine.

We do not (very far from it) say that the late rebellion in Canada, was not provoked by despotic grievances, on the part, not of the British government of that time at home, but on the part of those who, especially in 1833 and 1844, were at the head of the Colonial office in Downing-street; and, who should have been taught wisdom, by the history of the causes which occasioned the American revolution. We are too familiarly acquainted with the Colonial Office, not to form the opinion that, if the present Earl Grey had succeeded the Earl of Ripon, as secretary of state for the colonies, that the Canadian rebellion would never have taken place.*

We have thus stated, briefly, our views of the Anglo-American, people after their becoming independent; and if ever the history of the world presented two nations in a condition to do each other the utmost possible good, or the greatest possible evil—such are the position and actual condition of England and America.

Therefore, as the course of doing each other reciprocally the utmost possible good, is that which all honest and wise men would desire, the government and the people of each country, should direct their most earnest, and honest efforts, to maintain and promote this honourable and humane course.

CHAPTER IX.

THE INTERCOURSE OF THE UNITED STATES WITH FOREIGN NATIONS—NEUTRAL TRADE—NAPOLEON'S DECREES—CONFISCATION OF AMERICAN SHIPS AND CARGOES—BRITISH ORDERS IN COUNCIL—ENGLAND AND AMERICA.

We maintain as a doctrine, which no argument can disprove, that THE HISTORY OF COMMERCE IS THE HISTORY OF CIVILISATION: always admitting, that we must not confound civilisation with civil liberty and religious freedom.

* We have endeavoured thoroughly, in a preceding work (BRITISH AMERICA) as far back as 1833, to place the "Condition of Canada Question" in a clear light before the public; and after fourteen years' experience, we would not blot out a single expression that we then wrote.

Under the Medici and during the reign of Louis the Fourteenth, civilisation was resplendent in Florence and in Paris, but there did not exist, in either, civil liberty or religious freedom.

Both the latter can exist without much commerce ; but civilisation can make no progress without the intercourse, caused by selling and buying, which has had its origin, first, in the early state of mankind, between one family and another,—then in its progress between one village and another,—then between one city and another,—and finally between all the nations of the earth, the one with the other, or, with all the others.

On the independence of the old British colonies, it would have been wise, to have placed the commerce and navigation of the mother country, and that of her children, on their attaining their majority, or independence, upon the basis of a coasting trade. We have conclusive evidence,* that the latter then would have agreed to commence, and maintain, an intercourse which would have enabled England to enjoy every possible advantage, which could be derived from the United States, if they had remained as colonies, and all those advantages, without either the perplexity or expense of governing them.

The advances made with respect to such wise policy by the United States was unhappily rejected by the British ministers, who were indeed foolish and ignorant of commercial principles, even in their generation. In this number, we do not include Mr. Pitt, who entertained a far different view of the principles, on which the commercial relations of England and America, should be re-established.

America, on her advances being rejected by the British government, unhappily adopted the absurd British navigation laws, and much of the previous system of British customs' duties. In other respects, and especially in following the judicious advice of Washington, "to cultivate free commerce and honest friendship with all nations, and to make entangling alliances with none," the administration of America adopted, generally, a practical and wise policy in her intercourse and trade with foreign states. Still, it was beyond human prudence to avert all dispute and difficulty with foreign nations.

The war between Great Britain and France, subjected the American trade to great losses and interruptions, occasioned by French decrees and blockades, and by British orders in council and blockades.

The great increase of the foreign trade of the United States of America, and particularly the carrying trade, has been very generally attributed to the neutral position of the United States during the last European war. It is true that the last war in Europe, opened all the colonies of France, Spain, and Holland, to neutral flags, and the products of those colonies, found their way to continental Europe; and they were supplied in return with merchandise, principally in American bottoms. This trade gave extensive employment to American ship-

* See Commercial Legislation of England and America, vol. ii. of this work, page 1311

ping; but we must not overlook the remarks made by the Committee of Commerce and Navigation, to the house of representatives, in 1830.

"It is a common impression," observes the committee in the report, "that our early *maritime prosperity* was owing to the wars growing out of the French Revolution, which enabled the United States and Great Britain to monopolise the carrying trade. Those who think so take but a *superficial view* of the causes, which gave a strong *impulse* to our navigation at that early period. These were, the rich and increasing agricultural resources, the removal of all the countervailing laws of the states, our commercial enterprise, and a foreign commerce without restrictions. Our navigation grew more rapidly before the continental war, when we had nothing to carry but our own productions, than it did at any period afterwards. For three years, from 1789 to 1792 the increase was near 300,000 tons; from 1793 to 1796 it ought to have been increased to a greater amount, but it was not over 200,000, showing clearly a more rapid increase, both in *ratio* and *amount*, *before* than *after* the war broke out." In fact, neither the one cause, nor the other, but both jointly, contributed, powerfully, to the increased trade and navigation of the United States.

The first act of hostility against the navigation of the United States, after the commencement of the war between Great Britain and France, was under the French decree of May 9, 1793, and others which followed, and also under the British order in council of the 8th of June, 1793, prohibiting flour and meal from being carried to France, or to any port occupied by the French armies. This was followed by other British orders in council in relation to the neutral trade with the French West Indies. The proceedings of the British government, under these orders, would, probably, have brought the United States into open war with Great Britain as early as 1794, had not Washington sent a peaceful mission to England; which ended in a treaty, concluded by Mr. Jay, on the 19th of November of that year; and under which, the merchants of the United States, received more than 10,000,000 dollars, as a compensation for property, taken under the British orders in council.

France considered this treaty a violation of existing engagements on the part of America, and the ratification, in 1796, of Mr. Jay's treaty, was immediately followed by a general seizure and condemnation of American vessels, under several decrees of the Executive Directory.

This brought the United States into partial hostilities with France, and which ended by a treaty concluded with the First Consul in 1800. The short peace of Amiens followed in 1802. War was renewed in 1803. The laws of nations were disregarded, not only between the belligerents themselves, but with neutrals. The maritime power of Great Britain swept or drove most of the mer-

* See Tables of Trade. Vol. ii. of this work.

chant vessels of France, Holland, and Spain, from the ocean. These nations became dependant upon a neutral flag, for their colonial as well as other supplies, and the United States became their sole carriers. In 1805 Great Britain considered this neutral trade of supplying her enemies as *a cover of enemy's property*, and as "*war in disguise*." A pamphlet, published in Great Britain that year, described the American people as "a new power that had arisen on the western shore of the Atlantic, whose position and maritime spirit were calculated to give new and vast importance to *every question of neutral rights*, especially in the American seas." And the author also declared, "that not a single merchant ship, under a flag inimical to Great Britain, now crosses the equator, or traverses the Atlantic ocean."

The British government and the admiralty courts revived the maxim of 1756; which assumed that neutrals, in time of war, could carry on no trade which they had not been accustomed to carry on in time of peace.

Great Britain had not previously objected to the Americans bringing colonial and other produce into the ports of the United States: there levying the duties upon these products, and then reshipping them with a drawback of most of the duties to any foreign country; but, in 1805, England declared this was only a relaxation of the rule of 1756; and on the 22nd of May, 1805, an American vessel, called the *Essex*, was, with her cargo, condemned under that rule by a decision of the admiralty courts. In consequence, many American vessels were seized and brought into British ports. This was naturally complained of by the American merchants. The United States had no treaty of commerce with Great Britain; the commercial part of that concluded by Mr. Jay having expired in 1804. The British government proposed a renewal of this treaty, to continue until two years after the close of the war; but this was declined by the American executive.

A new negotiation was opened by Mr. Munroe and Mr. Pinckney, to adjust the claims of the American merchants, and to endeavour to settle the vexatious question of impressment, and also to regulate the colonial trade.

On the last day of December, 1806, during the Fox administration, Messrs. Munroe and Pinckney, with much difficulty, concluded a treaty with Great Britain. With respect to the colonial and other trade, the eleventh article provided, that, during the then existing war, European products might be carried to the port of any colony belonging to the *enemy* of Great Britain, provided they had been entered and landed in the United States, and paid the ordinary duties; and on re-exportation, should, after the drawback, have been subject to a duty equivalent to not less than one per cent *ad valorem*, and were *bonâ fide* the property of American citizens. And the produce of the colonies of the enemy might also be brought to the United States, there entered, landed, and having paid the duties, might be re-exported to any part of Europe, subject to a

duty, after the drawback, of not less than two per cent *ad valorem*. This treaty was rejected by Mr. Jefferson, without even consulting his constitutional advisers; principally he stated on the ground of its wanting an express stipulation against future impressments. It is true the American commissioners could not negotiate a treaty stipulation as to impressment. But the British commissioners, in a written communication, gave assurances of security against the future abuse of the practice of impressment, which satisfied the American commissioners.

Mr. Munroe, in his letter to the president, of the 28th of February, 1808, giving his reasons for assenting to the treaty, on this point says—"We were, therefore, decidedly of opinion, that the paper of the British commissioners placed the interest of *impressment* on ground which it was both safe and honourable for the United States to admit; that, in short, it gave their government the command of the subject, for every necessary and useful purpose. Attached to the treaty, it was the basis or condition on which the treaty rested." The consequences of the failure of the negotiation are, by Mr. Munroe, described in the following language—"War, therefore, seemed to be the inevitable consequence of such a state of things. I was far from considering it an alternative which ought to be preferred to the arrangement which was offered to us. When I took into view the prosperous and happy condition of the United States, compared with that of other nations, that, as a neutral power, they were almost the exclusive carriers of the whole world; and that, in commerce, they flourished beyond example, notwithstanding the losses which they occasionally suffered, I was strong in the opinion that these blessings ought not to be hazarded on such a question."

The rejection of this treaty ultimately led, as Mr. Munroe had predicted, to a most unfortunate war with Great Britain.

After the battle of Jena, in 1806, which placed the capital of Prussia in the hands of Napoleon, that conqueror issued, on the 21st of November following, his famous "Berlin Decree." This decree was the first great declaration of a war of material injuries—a war against international trade—a war against commodities—a war intended to be as destructive to national prosperity, and as universal, as his wars of bloodshed and depopulation.

There was grandeur, magnificently diabolical, in the idea. There could not have been a greater proof of the absence of wisdom, or forecast, in the mind from whence it emanated. It was a decree, which, by subjecting the kingdoms, and states of Europe, to a privation of their wonted supplies, whether of necessity, convenience, or luxury, increased the discontent and hatred of the German and other nations and people who never did nor could love him.

This war against commodities, called the "Continental System" was, *en grandiose*, destined for the destruction of the British empire. It was the germ, out of which grew that powerful Germanic and European combination, which

afterwards strengthened, until it finally terminated in the downfall of Napoleon. It declared "the British islands in a state of blockade, and prohibited all commerce and intercourse with them,—all letters or packets written in England, or to an Englishman, *in the English language*, were to be seized in the post-offices,—every British subject, of whatever rank or condition, found in countries occupied by French troops, or those of the allies of France, were to be made prisoners of war. Every warehouse, all merchandise or property whatever, belonging to an Englishman, was declared 'good prize.' No vessel coming directly from England or her colonies, or *having been there*, after the publication of the decree, was to be admitted into any port; and every vessel, by a false declaration, contravening the foregoing disposition, was to be seized, and the ship and cargo confiscated as English property."

This decree was declared to be the fundamental law of the empire, until England should acknowledge that the rights of war should be the same on land as at sea; that it should not be extended to any private property whatever, nor to persons who were not military; and, until the right of blockade be restrained to fortified places, actually invested by competent forces. This decree, even in its partial execution, was grievously injurious to most of the commercial cities of continental Europe. Hamburg, Bordeaux, and other ports, petitioned for some relaxation of it in their favour; but Napoleon declared that "Britain must be humbled, were it at the expense of throwing civilisation back for centuries, and returning to the original mode of trading by barter."

He could not, however, at once induce all the continental powers to co-operate with him.

Spain and Holland had long been subject to his despotism. The battle of Austerlitz, and the treaty of Presburg, placed Austria under his control. But Russia and Prussia, and some of the minor powers of Europe, were not for some time brought to the terms of humiliation which awaited them.

The humiliating conditions which he demanded of the King of Prussia, retarded the negotiation. Frederick William III., relying on the aid of England and of the Russian armies, continued the war until the battle of Friedland and the treaty of Tilsit, added Prussia and Russia to the nations which bowed to Napoleon. A secret article engaged them to carry into effect the continental system; and Russia and Prussia, in the months of September and November following, joined France against British power.

Napoleon returned to Paris in July, 1807, in order to induce all neutral powers to accede to his continental decree. The Danish and Portuguese ministers, at a general audience which he held with all the foreign ministers, on the second day of August, were apprised that all neutrals were required to unite with France against Great Britain.*

* The American minister, General Armstrong, writes on the 3rd of August 1807:—

"I have had an audience with the emperor since his return. I stood near Baron Dyer, the

Portugal was soon called upon "to accede to the continental system. Not complying immediately, war was declared against her on the 21st of October, 1807, and in six days after, Napoleon and the Prince of Peace, *by a secret treaty*, partitioned Portugal between them; and, the Portuguese American possessions were also to be divided between France and Spain. On the 4th of December, Junot, with his army, occupied Lisbon; and he issued a proclamation declaring that the interests of the Portuguese engaged the emperor and king his master, and "that the destinies of Portugal were brightening, and her future happiness secured, because Napoleon the Great had taken her under his *omnipotent protection*." In the meantime, the Prince Regent of Portugal sailed for Brazil, under the protection of a British squadron. Napoleon would no doubt have extended the same "omnipotent protection" to Denmark, had not Great Britain anticipated him, by forcibly, we do not say justly, taking possession of the whole Danish fleet.

The north of Europe was thus kept open to British navigation and trade through the Baltic. Napoleon, therefore, did not immediately attempt to force the continental system against the vessels of the United States, and General Armstrong was informed by the French minister of marine, that the decree was not to affect American commerce, "which would still be governed by the rules of the treaty established between the two countries."

But "*the turn of the Americans came at last.*" On the 18th of September, 1807, Regnier, the grand judge, referring to American vessels, informed the procureur-general of the council of prizes, "that, as the emperor had not thought proper to express any *exception* in his decree, there was no ground to make any, in the *execution, in any thing whatever.*" To a remonstrance presented by General Armstrong, the secretary of foreign relations replied, on the 7th of October, "that his majesty has considered every neutral vessel going from English ports, with cargoes of English merchandise, or of English origin, as lawfully seizable by French armed vessels." "The decree of blockade," he adds, "has now been issued eleven months. The principal powers of Europe, far from protesting against its provisions, have adopted them. They have perceived that its execution *must be complete*, to render it effectual; and it has seemed easy to reconcile these measures with the observance of *treaties*, especially at a

Danish minister. The emperor spoke to him and said, 'So, baron, the Baltic has been violated: ' he did not hear the baron's answer, and the emperor said to him, in a voice more raised and peremptory, 'So, baron, the Baltic has been violated.' From the Danish minister he proceeded to myself and others, and went to the minister of Portugal, and it is said, read to him a severe lecture on the conduct of his court. These circumstances," the American minister adds, "go far to justify the *whispers* in circulation, that an army is raising in the south, to take possession of Portugal, and another in the north to go against Denmark; and generally, that having settled the affairs of the *belligerents* (except England, to his liking, he intends to settle those of *neutrals*, in the same way. On this account, probably, Baron Dyer took me aside, and asked me, whether an application had been made to me to join in the *projected union* of all commercial states against Great Britain? On my answering in the negative, he said, 'You are a favoured nation, but *your turn must come, at last.*'"

time when the infraction by England, of the rights of maritime powers, render their interests *common*, and tends to *unite them*, in support of the same cause."

In consequence the cargo of an American vessel, the *Horizon*, was confiscated, under the 5th article of the Berlin decree, as being merchandise of English origin. The American minister remonstrated, and the reply of the French government was, "that England in violating the rights of all nations had united them all, by a common interest, and that it was for them to have *recourse to force* against her, and that on these *conditions* alone the Americans could expect redress, for the injuries of which they complained." "All the difficulties, sir," he continued, "which have given rise to your reclamations, *would be removed with ease*, if the government of the United States, after complaining of the injustice and violation of England, took, with the whole continent, the part of guaranteeing itself therefrom."

On the 20th of October, Louis, King of Holland, issued a decree, enforcing that of Berlin, and ordering that "*that all correspondence, journals, &c., which should come, in a neutral flag, should be seized and burnt.*"

On the 11th of November, 1807, the British orders in council were issued in opposition to the Berlin decree. By these orders, "all the ports and places of France and her allies, or of any other country, at war with his majesty, and all other ports or places in Europe, from which, although not at war, the British flag was excluded, and all other ports or places, in the colonies belonging to his majesty's enemies, were to be subject to the same restrictions, in point of trade and navigation (with certain exceptions) as if the same were actually blockaded by his majesty's naval forces, in the most strict and rigorous manner; and all trade in articles, which are of the produce or manufacture of the said countries or colonies, should be deemed and considered unlawful; and any vessel trading from or to said countries or colonies, with all the goods and merchandise on board, and all the articles of the produce or manufacture of such countries or colonies, might be captured and condemned as prizes to the captors."

To the British orders of November 11th, succeeded a decree, issued at Milan on the 17th of December, declaring, "that every ship, to whatever nation belonging, that shall have submitted to be searched by an English ship, or to a voyage to England; or that shall have paid any tax whatever to the English government, shall thereby, and for that alone, be denationalised, to have forfeited the protection of its king, and to have become English property—and the ships so denationalised, on entering the ports of France, or those of her allies, or on falling into the hands of French ships of war, or privateers, were declared lawful prizes. And by the same decree, the British islands were again declared in a state of blockade, both by sea and land."

In January, 1808, Napoleon directed his minister to inform General Arm-

strong, that, in consequence of the British orders of November 11th, he could not doubt, but that the United States had declared war against Great Britain, "War then exists," says Champagny, "in fact, between England and the United States; and his majesty considers it, as declared from the day on which England published her decrees. In that persuasion, his majesty, ready to consider the United States, as *associated* with the cause of all the powers who have to defend themselves against England, has not taken any *definitive measure* towards the American vessels, which may have been brought into our ports; he has ordered, that they should remain *sequestered*, until a decision may be had thereon, according to the *dispositions* which shall have been *expressed* by the government of the United States."

Soon after, Napoleon declared in council, that the Americans should be compelled to be his *allies* or his *enemies*; and then ordered the condemnation of some American vessels, then under sequestration. This was communicated to the American executive, by General Armstrong, in a despatch dated the 22nd of February, 1808.

"Nothing has occurred here," says Mr. Armstrong, "since the date of my public despatches (the 17th) to give to our business an aspect more favourable than it then had; but, on the other hand, I have come to the knowledge of two facts, which I think sufficiently show the decided character of the emperor's *policy* with regard to us. These are, first, that, in a council of administration, held a few days past, when it was proposed to modify the operation of the decrees of November, 1806, and December, 1807 (though the proposition was supported by the whole weight of the council), he became highly indignant, and declared that these decrees should suffer *no change*—and that the Americans should be *compelled* to take the positive character of either *allies* or *enemies*—secondly, that on the 27th of January last, twelve days after Mr. Champagny's written assurances that these decrees should work no change in the property sequestered until the discussions with England were brought to a close, and seven days before he reported to me verbally these very assurances, the emperor, by a *special decision*, confiscated two of our ships and their cargoes (the *Julius Henry* and *Juniata*) for want merely of a document, not required by any law or usage of the commerce, in which they were engaged. This act was taken, as I was informed, on a general report of sequestered cases, amounting to 160; and which, at present prices, will yield upwards of 100,000,000 francs, a sum, whose magnitude alone, renders hopeless all attempts at saving it. Danes, Portuguese, and Americans, will be the principal sufferers.

"If I am right in supposing the emperor has definitively taken *his ground*, I cannot be wrong in concluding that you will immediately take yours."

The American government had, previously to receiving this information, ordered the whole American shipping back into their own ports.

The despatches reached Washington from the American minister at Paris, together with a newspaper, containing a proclamation of the King of England, of the 16th of October, recalling his subjects from abroad, in foreign service, and giving directions as to the mode of searching for and taking them, when found on board commercial neutral vessels. These were submitted to Congress: but the letter of General Armstrong, dated August 3, 1807, disclosing the *views* and *policy* of Napoleon in relation to neutrals, was withheld.

In communicating the papers to Congress, the president said they would

show "the great and increasing dangers with which our vessels, our seamen, and merchandise, are threatened on the high seas and *elsewhere*, from the belligerent powers of Europe"—and he recommended an embargo, which, in consequence, was laid on all American ships, on the 22nd of December, and without any limitation as to time.

The secretary of state, in communicating to the American minister at London the embargo act, observes, "Among the considerations," he added, "which enforced it, was the *probability* of such *decrees*, as were issued by the British government, on the 11th of November, the *language of the British gazettes*,* with other indications, having left little doubt, that such were *meditated*."

The British and American governments, were persuaded that Napoleon was determined that there should be no neutral nations, and that his policy was to compel all to enforce the Berlin decree against England. That Great Britain would adopt measures of resistance, was therefore considered by the American government as indispensable. But the American public, even the members of the national legislature, being ignorant of the facts, which actuated the executive in placing under an absolute embargo the whole navigation and trade of the country, great diversity of opinion prevailed as to the *causes*, as well as the *policy* of this apparently desperate measure. This policy of the American government was a most absolute invasion upon the trade of the people of the United States; a policy which no circumstance would have justified, but the safety of the national shipping.

Mr. Jefferson in a letter to one of his political friends (January 1, 1814,) says,—“The true line of *policy for us*, is, that Napoleon should be able to effect the *complete exclusion* of England from the whole *continent of Europe*, in order by this *peaceable engine of restraint*, to make her *renounce* her views of dominion on the ocean, of permitting no other nation to navigate it, but with her licence, and on tribute to her; and her *aggressions on the persons of our citizens*, who may choose to exercise their right of passing on that element—and this would be *effected* by Napoleon's succeeding so far as to close the *Baltic* against her. I wished such *limits* only, to the successes of Napoleon, as *should not prevent* his completely *closing Europe* against British manufactures and commerce, and *thereby reducing her* to just terms of peace with us.”† Of the many unsound views of this extraordinary man, we do not find any more difficult to reconcile than this view of a grave and constitutional question; and subsequent events have proved his want of forecast.

Mr. Jefferson termed the Berlin decree, a “peaceable engine of restraint;”

* We have often had occasion to observe the credulity of the American people in respect to passages in the British newspapers: which, with little examination, they take as the opinion of the British government, or British people.

† Jefferson's Memoirs, Vol. IV., p. 232.

which, in order to humble England, rendered it politic for America to retain her products and merchant fleets within her ports.

Napoleon certainly did not consider the American embargo as against, but, as in support of, his continental system, in which the Americans had become *allies*, in his war of material injuries against Great Britain.

The Bayonne decree, issued in April, 1808, was declared to be an enforcement of this *fallacious* alliance. This decree directed the douaniers "to seize all American vessels then in French ports, or which might come into them hereafter"—and the American minister was informed, that these seizures were perfectly legal, "because no vessel of the United States *can now navigate the seas without infracting a law of the said states, and thus furnishing a presumption that they do so on British account, or in British connexion.*" Talleyrand, in a report to Napoleon, dated the 8th of September, 1808, says—"The Americans, a people who involve their fortunes, their prosperity, and almost their existence in commerce, have given the noble example of a great and courageous sacrifice. They have prohibited, by a general embargo, all commerce and navigation, rather than submit to that tribute which the English impose." On the 5th of August, 1810, the Duke of Cadore, acquainted the American minister, that the emperor "had applauded the embargo laid by the United States." Napoleon's expressions were communicated to the American executive by Mr. Livingston.

Mr. Jefferson, in answer to Mr. Livingston's despatch, informing him that Napoleon considered the embargo "a wise measure," says (15th of October, 1808):—"The explanation of his principles, given you by the French emperor, *in conversation*, is correct, as far as it goes. He does not *wish us* to go to war with England, knowing we have no ships to carry on that war. To submit to pay England the tribute on our commerce, which she demands by her orders in council, would be to aid her in the war against him, and would give him just ground to declare war with us. He concludes, therefore, as every rational man must, that the *embargo*, the only remaining alternative, *was a wise measure.*" Was this, now admitted unsound, view entertained from a principle, or feeling, of patriotism; or was it grounded on that hatred towards England, which Mr. Jefferson's philosophy seems never to have been able to subdue? No truly great statesman or wise philosopher, would hate any country or people. We may condemn the policy and the mal-administration of a government, and we may lament the ignorance, the barbarism, or the immorality of a people,—but that mind must be vitiated by mean feelings, which can entertain a hatred to a whole people, however obnoxious he may be to the characters and acts of individuals.

The embargo was, very naturally, repulsive and injurious, to the shipping and trading interests of America. Napoleon's decrees were not more odious to the merchants of the Hanse Towns and of Holland, than the embargo, as well as the decrees, were to those of America. The American ships were rotting in their ports.

The public, deprived of a market for their products, became impatient,—but the long-continued popularity of Mr. Jefferson, enabled him for some time to persevere in his favourite scheme against England. His own political friends, however, compelled him to transform the embargo, into a *non-intercourse with England and France*.

The law of non-intercourse was passed by Congress on the 1st of March, 1809, and to be in force on the 20th of May following. In April, the British minister gave assurances to Mr. Jefferson, that the British orders in council should be withdrawn on the 10th of June following. In consequence of which the president issued a proclamation; and on the 10th of that month the American trade with Great Britain was re-opened. This arrangement was disavowed by the British government, on the ground that Mr. Erskine had exceeded his powers. The act of the 1st of March was, in consequence, revived, against Great Britain on the 9th of August.

Napoleon, though enraged at the discontinuance of the embargo, as well as the non-intercourse of American ships with France, concealed his plans until the continental ports of Europe, within his power abounded with American ships; which, with their valuable cargoes, were suddenly seized and confiscated. The American minister remonstrated against this flagrant outrage, and, on the 17th of February, 1810, General Armstrong was informed by the French minister, “that his majesty could place *no reliance* on the proceedings of the United States, who, having *no ground of complaint against France*, comprised her in their acts of exclusion; and, since the month of May, have forbidden the entrance of their ports to French vessels, under the penalty of confiscation. As soon as his majesty was informed of this measure, he considered himself bound to order reprisals on American vessels, not only in his territory, but likewise in the countries which are under *his influence*. In the ports of Holland, of Spain, of Italy, and Naples, American vessels were seized, because the Americans have seized French vessels.

“The Americans cannot hesitate as to the part which they are to take: they ought to tear in pieces the act of their independence, and to become again, as before the revolution, the subjects of England, or to take such measures, as that their commerce and industry should not be tarified (*tarifiés*) by the English, which renders them more dependant than Jamaica, which, at least, has its assembly of representatives and its privileges.” “Men without just political views (*sans politique*),” the French minister adds, “without *honour*, without *energy*, may allege that payment of tribute imposed by England, may be submitted to because it is light; but why will they not perceive, that the English will no sooner have obtained the admission of the principle, than they will raise the tariff in such way that, the burden at first light becoming insupportable, it then will be necessary to fight for *interest* after having refused to fight for *honour*.”

It is astonishing that this insult to their country, and people, should have been, as it was, tamely submitted to by the American executive, so far as not even to order the minister at Paris to repel such false charges against the honour and conduct of the nation. But General Armstrong, much to his honour, took upon himself to repel the foul accusation, "that the United States had nothing to complain of against France," and boldly demanded, "was the capture and condemnation of a ship, driven on the shores of France by stress of weather and the perils of the sea—nothing? Was the seizure and sequestration of many cargoes, brought to France in ships, violating no law, and admitted to regular entry at the imperial custom-houses—nothing? Was the violation of our maritime rights, consecrated, as they have been, by the solemn forms of a public treaty—nothing? In a word, was it *nothing*, that our ships were *burnt* on the high seas, without other offence than that of belonging to the *United States*; or other apology, than was to be found in the enhanced safety of the perpetrator? Surely, if it be the *duty* of the United States to *resent* the *theoretical usurpations* of the British orders of November, 1807, it cannot be less their duty, to complain of the *daily* and *practical outrages* on the part of France."

The merchants of Holland not having fully complied with the edict of Napoleon, he threatened, on the 24th of January, 1810, to "recall the *prince of the blood*, his brother Louis, whom he had placed on the throne of Holland—to occupy all the mouths of the rivers in that country, and all its ports, by French troops;" and, "to employ every means, without being *stopped by any considerations*, to make Holland enter into the continental system."

Louis was sent for to Paris, where, in March, 1810, he signed a treaty, by which he not only bound himself to enforce the continental system, with the utmost rigour, but that "all the merchandise imported by American vessels that have arrived in the ports of Holland, since the 1st of February, 1809, shall be put under *sequestration*, and *made over to France*, in order to her disposing thereof, according to *circumstances*, and the state of her *political relations* with the United States."

By the Rambouillet decree, published on the 14th of May, 1810, Napoleon ordered that all vessels under the flag of the United States, which, from the 20th of May, 1809, had entered, or should enter, into the ports of his empire, of his colonies, or of the countries occupied by his arms, should be seized, and the products of the sale deposited in the surplus fund (*caisse d'amortissement*).

This decree was soon after executed, and the property of American citizens, to the value of many millions of dollars, in the various continental ports, was sold.

American ships, with their cargoes, entered the continental ports, without having notice that they did so irregularly; on the contrary, those richly laden with cargoes of colonial produce, entered the port of Naples, at the express invitation of Napoleon's agent.

The government of the United States was at last induced to admit, by the law of the 1st of May, 1810, the commercial ships of England and France into American ports, excluding ships of war.

The French government was, at the same time, informed by the American government, that a "satisfactory provision for the restoration of the property of the Americans, seized in the ports of the continent, must be combined with a repeal of the French edicts, with a view to a non-intercourse with Great Britain; such a provision being *indispensable evidence* of the *just purpose* of France towards the United States."

This decision was communicated to the governments of France and England. The Duke de Cadore wrote on the 5th of August, 1810, to General Armstrong: "that Congress, by the act of May 1, 1810, having *retraced* its steps, and engaged to oppose the belligerents refusing to acknowledge the rights of neutrals; that in this new state of things, he was authorised to declare, that the decrees of Berlin and Milan were revoked, and that after the 1st of November, they would cease to have effect, *it being understood*, (*bien entendu que*) that, in consequence of this declaration, the English shall revoke their orders in council, and renounce the new principles of blockade which they have wished to establish, or that the United States shall cause their rights to be respected by the English."

The letter concludes with a declaration, that, "his majesty (Napoleon) *loves* the Americans—their *prosperity and their commerce are within the scope of his policy*."

The president of the United States published a proclamation of the 2nd of November, 1810, declaring, that the French edicts were, in fact, revoked on the 1st of November; and that, unless the British orders in council should be revoked on or before the 2nd of February, 1811, the non-intercourse law should be revived against Great Britain.

Napoleon certainly did not intend that his continental system should cease until the United States should become a party in the war; and, consequently, American ships, with their cargoes, were, after the 1st of November, seized and held in *sequestration*, or as pledges, until Napoleon should ascertain what would be "the state of his *political relations* with the United States."

The Duke of Cadore, in a report to the emperor, says, "As long as England shall persist in her orders in council, your majesty will persist in your decrees." On the 31st of March, 1811, Napoleon, in an address to his council of commerce, declares that "*the decrees of Berlin and Milan are the fundamental laws of my empire. For the neutral navigation, I consider the flag as an extension of territory. The power which suffers its flag to be violated, cannot be considered as neutral. The fate of American commerce will soon be decided. I will favour it if the United States conform themselves to these decrees—in the contrary case, their vessels will be driven from my empire.*"

During the latter month of the year 1810, the American government urged on that of England a revocation of the orders in council, on the ground of the *actual repeal* of the French decrees. The British government insisted, that the decrees were still in force, and demanded an official act of the French government, repealing those decrees, of as high an authority as that by which they were promulgated; and that the letter of the Duke of Cadore was not a document of that character—that it was a mere declaration that they would thereafter be repealed, on certain conditions—a declaration that had never been carried into effect by any act of Napoleon.

The American merchants expected payment of the immense value of their property plundered by Napoleon; but on the arrival of a new French minister (Serrurier) at Washington, in 1811, he gave official notice of the determination of the emperor not to make any remuneration for the property confiscated by his orders.

The policy of the President of the United States at this time appears inconsistent and unaccountable, unless it be attributed to a hatred towards England, or to extend his popularity, by exciting the passions of the citizens. Instead of obtaining explicit answers from the new ambassador from France, as to the revocation of the Milan and Berlin decrees, he kept the Congress in utter ignorance of the real projects of Napoleon, and in consequence, on the 2nd of March, 1811, passed a non-intercourse act against Great Britain.

It was well known to the president, that at the time of passing this act, Napoleon's decrees were not revoked. Mr. Smith, the Secretary of State, even declared, that, "from information which had been received by Mr. Madison, prior to the date of the non-intercourse law (that of March 2, 1811) it was, at the time of passing it, evident to my mind, that the Berlin and Milan decrees had not been revoked, as had been declared by the proclamation."

While Napoleon was cajoling the government and people of the United States, with pretensions of "his *love* for them and for their prosperity and commerce," his measures were directed to undermine or curtail their commerce and power. He imposed a duty of eighty cents on Sea Island, and about sixty cents on all other American, cotton imported into France; and he only permitted the trade between the two countries under the authority of special imperial licences, specified articles only, viz.: cotton, fish, oil, hides and peltry, dye-woods and salt-fish, were allowed to be imported. The importations were permitted to be from none but the ports of New York and Charleston; the cargoes of these articles were not to be admissible, unless accompanied by a certificate of origin from a French consul. As to return cargoes, the American ships were constrained to be laden with wines, brandy, silks, linens, cloth, jewellery, household furniture, and other French manufactured articles.

Mr. Barlow, the new American minister at Paris, received special instructions to negotiate a commercial treaty with France.

He received flattering assurances of the emperor's readiness to conclude a commercial treaty of reciprocity, including indemnities for the confiscated property of citizens which had been seized and sold.

The *continental system* was, however, maintained, and this formed an insurmountable obstacle to any satisfactory treaty.

On the 10th of March, 1812, the Duke of Bassano, in a report made to the emperor, declared that "as long as the British orders in council shall not be repealed, and the principles of the treaty of Utrecht, with respect to neutrals, put in vigour, the decrees of Berlin and Milan *must remain in force*, as to all those powers, who suffer their flag to be *denationalised*. The ports of the continent must not be opened, either to *denationalised flags*, or to English merchandise."

By the Milan decree, every ship that should have submitted to be searched by an English ship, or made a voyage to England, or that should have paid any duty to the British government, was *denationalised*, and liable to condemnation.

Mr. Barlow writes to his government on the 2nd of April, 1812:—"This is *dull* work, hard to begin and difficult to pursue. I urged it a long time, without the effect even of an *oral* answer. But lately they have consented to give it a discussion, and the minister assures me, that something shall be done, *to silence the complaints*, and on principles that, *he says*, ought to be satisfactory."

Great Britain was again urged to revoke her orders, on the ground of the actual repeal of the French decrees. This was not admitted by the British government, which required some authentic act of the French ruler revoking these decrees; and, on the 21st of April, the prince regent, by a proclamation, declared, that "whenever the French decrees, by some authentic act of the French government, *publicly promulgated*, should be absolutely and unconditionally repealed, the orders in council should be revoked."

Mr. Barlow, in consequence, urged the French government to furnish the evidence required by Great Britain.

"It is much to be desired," he says, in a note to the French minister, of May 1st, "that the French government would now *make and publish an authentic act*, declaring the Berlin and Milan decrees, as relative to the United States, to have ceased, in November, 1810, declaring that they have not been applied, in any instance since that time; and that they shall not be so applied in future. The case is so simple, the demand is so just, and *the necessity* so urgent, that I cannot withhold my confidence, in the prompt and complete success of my proposition."

The French government showed him, in consequence, on the 10th of May, a copy of a decree, purporting to have passed on the 28th of April of the preceding year; in which, after a preamble, Napoleon declares, that "the decrees of Berlin and Milan are *definitively*, and to date, from the first day of November last, considered as not having *existed (non avenus)* in regard to American vessels."

Mr. Barlow writes, on the 12th of May, to his government this transaction:—

“When, in the conversation above alluded to, the duke first produced to me the decree of the 28th of April, 1811, I made no comment on the strange manner in which it had been so long concealed from me, and probably from you. I only asked him if that decree had been published. He said no, but declared it had been communicated to my predecessor here, and likewise sent to M. Serrurier, with orders to communicate it to you. I assured him it was not among the archives of the legation; that I had never before heard of it; and since he had consented to answer my note, I desired him to send me, in that official manner, a copy of that decree, and of any other document that might prove to the incredulous of my country (not to me) that the decrees of Berlin and Milan were in *good faith and unconditionally* repealed, with regard to the United States. He then promised me he would do it, and he has performed his promise.”

The declaration of the French minister, that the decree, though not published, had been communicated to the predecessor of Mr. Barlow (Mr. Russel), and also sent to M. Serrurier, to be communicated to the American government, is remarkable; and it is still more so when we consider, that neither the decree nor Mr. Barlow's letter of the 12th of May, although both were received at the office of the department of state, on the 13th of July, 1812, were laid before Congress until the 3rd day of March, 1813, and then only in consequence of a special demand of the House of Representatives.

The president, in his message to Congress, at the opening of the session, on the 4th of November, 1812, referring to the subject of this decree, merely observed:—“This proceeding, although made the ground of the repeal of the British orders in council, is rendered, by the *time* and *manner* of it, liable to many *objections*.”

The spirit of concealment appears to have been cherished, at the time, as much by the cabinet of Washington as by the court of Napoleon. We have referred to these particulars, merely on account of the unfortunate policy that was almost immediately after followed by the President of the United States.

Although Napoleon can scarcely be said to have possessed a navy, he had small, fast sailing, armed vessels, which put to sea in squadrons, seizing and destroying, as far as in their power, American vessels; and one of these squadrons captured, between the 4th day of February and the 6th of May, 1812, on the high seas, twenty-seven American vessels,—many of which were burnt. Among those thus captured and burnt was the ship *Asia* of Philadelphia, and the brig *Gershon* of Boston, both bound to Lisbon, laden with corn and flour. The French commander, on putting the crews of these ships on board of an American ship bound to the United States, gave them a certificate, in which he declared that they had been captured “*d'après les instructions de son excellence Monseigneur le Ministre de la Marine et les Colonies.*” The papers of the *Asia* and the *Gershon* were burnt.

Notwithstanding all the outrages that had been committed by Napoleon on American navigation and trade, the president, on the 1st of June, 1812, recommended a declaration of war against Great Britain. This declaration was made by the House of Representatives on the 4th, but was not finally concurred in by the Senate until the 17th of the same month.

We are not about to exculpate England from having committed some severe, and some unjust acts, towards American shipping, but we confidently attribute the acquiescence of the Congress to the declaration of war against Great Britain, to the dishonesty of the president, in not laying before that body the decree of Napoleon repealing his Berlin and Milan decrees, until such time as his treaties for the destruction of British power were acceded to by the legislature of the United States.

An embargo for sixty days was recommended by the president on the 1st of April, and almost immediately adopted by both houses. This was the herald of the war which followed.

The British orders in council were revoked on the 22nd of June, and war was declared against Great Britain, before it was known that the British orders in council were revoked. Had the intelligence reached Washington, that war would not have taken place.

The embargo and the war were exceedingly injurious to American, and to European commerce; and we consider that the statesmen, who, from the lust of arbitrary power, or from whatever cause or reason, bring the countries whose administration is entrusted to them, unnecessarily into the calamities of war, are the greatest of all traitors. This unnatural and unnecessary war was attended with no other effect than the destruction of life and property. Two acts of the British fleet on the American coast are to be especially denounced—the burning of Washington, and the proclamation to induce American runaway slaves to come on board British ships as an asylum. The first was a barbarism worthy only of the early buccaneers. The latter was a mad, inconsiderate act on the part of Admiral Sir Alexander Cochrane, when slavery, too, in its most severe form prevailed in every British West Indian possession.

The government of the United States, most justly, obtained afterwards an indemnity for the losses sustained by the citizens, under Napoleon's continental system, and from England, for the slaves most injudiciously taken away by the British admiral on the coast during the war. Of the deplorable fate of these slaves, we have given a full account in another work.* Nor can we but condemn the employment of the Indians even as allies in the Canadian frontier war. It is true, that the Indians were not allowed to commit atrocities similar to those which they perpetrated during the war of the American revolution: yet, even under any circumstances, we denounce the employment of the aborigines, in a war between the European races in America.

The last American war was rash on the part of the government of the United States. That it was so is evident from the date of the revocation of the orders in council in England, being previous to its being possibly known, in Great Britain, what course would be pursued by the President of the United

*- See Macgregor's *British America*, vol. i.

States.* That war, however, developed one great fact—that was, *the general unwillingness of the citizens to tax themselves to pay the inevitably great expense of maintaining an aggressive war.*†

We are confident that the citizens of the United States would, on the other hand, tax themselves to the value of the last dollar and the last acre which they possessed, in a defensive war—in a war defending against aggression their country, their property, and, above all, their civil and religious liberties.

There was only one other great fact thoroughly established during this disgracefully unnecessary war—that was, the undoubted bravery of the Anglo-American race, both on sea and on land. They fought especially on the sea with the most extraordinary maritime skill, courage, and self-possession.

CHAPTER X.

REVIEW OF EVENTS IN THE UNITED STATES SINCE THE PEACE OF 1815.—PRESIDENCIES OF MR. MUNROE AND JOHN QUINCY ADAMS.

IN 1815, in consequence of the outrageous conduct of the Dey of Algiers in expelling the consul and American citizens from his territory, in violation of the treaty between both countries, and seizing American vessels and citizens, war was declared against that regency of pirates. An American squadron appeared

* “During the war, though the results had been honourable to the American arms, a large portion of the inhabitants of the New England states were unceasingly opposed to the measures of the administration. To insure unity of views and concert in action, the legislatures of Massachusetts proposed a ‘conference,’ by delegates from the legislatures of the New England states, and of any other states that might accede to the measure.

“The proposition was readily assented to by several states, and the delegates appointed in pursuance of it met at Hartford, on the 15th of December following (1814). The convention recommended, 1. That the states they represent take measures to protect their citizens from ‘forcible draughts, conscriptions, or impressments, not authorised by the constitution of the United States.’ 2. That an earnest application be made to the government of the United States, requesting their consent to some arrangement, whereby the states separately, or in concert, may take upon themselves the defence of their territory against the enemy, and that a reasonable portion of the taxes collected within the states be appropriated to this object. 3. That the several governors be authorised by law to employ the military force under their command in assisting any state requesting it to repel the invasions of the public enemy. 4. That several amendments of the constitution of the United States, calculated in their view to prevent a recurrence of the evils of which they complain, be proposed by the states they represent for adoption either by the states’ legislatures, or by a convention chosen by the people of each state. Lastly, *That if the application of these states to the government of the United States should be unsuccessful, and peace should not be concluded, and the defence of these states be still neglected, it would, in their opinion, be expedient for the legislatures of the several states to appoint delegates to another convention, to meet at Boston, in June, with such powers and instructions as the exigency of a crisis so momentous may require.* The effect of these proceedings upon the public mind in the aggrieved states was alike seasonable and salutary. The very proposal to call a convention, and the confidence reposed in the men delegated to that trust, served greatly to allay the passions, and to inspire confidence and hope.”—*Book of the United States.*

The arrival of the Treaty of Peace with England rendered unnecessary the act passed by the Congress in pursuance of these recommendations. But the spirit manifested by the Hartford convention must ever be considered remarkable.

† The whole financial history and statistics of the United States, as developed in the second volume of this work, and drawn up altogether from American authorities, will fully establish the truth of this incontrovertible fact.—(*See* Currency and Banking, p. 1068 ; et seq. and Finances of the United States, p. 1198, et seq. vol. ii. of this work.)

in the Mediterranean, captured the Algerine admiral, and in consequence the Dey submitted to a peace, by which he relinquished all pretensions to tribute from the citizens of the United States.

Mr. Munroe succeeded Mr. Madison in the presidency in 1817. The progress of settlement, west of the Alleghanies, now proceeded with extraordinary rapidity. The territories of Indiana, Mississippi were admitted as federal states; the Choctas, Chikasaws, and Cherokee tribes ceded by treaty large territories, and placed themselves by treaties under the protection of the United States. The expulsion of the South American patriots from Florida, under the Venezuelan general, Gregor Macgregor, was followed by the purchase of Florida from Spain in 1819, the sale of which was ratified by the King of Spain in 1821. Pensacola, the capital, was delivered up to General Tucker on the 7th of July, that year; and on the 10th of the same month, the Spanish governor, gave possession of East Florida to the United States commander, Colonel Butler. The occupation of the Floridas, the condition of the Spanish settlers, and the expensive, destructive—and we cannot but say, most cruel war with the Indians of that territory, all require far too detailed an account in the annals of America to be introduced within the limits of the historical sketches of this work: the second volume of which we shall devote nearly altogether to the progress and statistics of the United States of Anglo-America.

In 1824, the treaty between England and America for the suppression of the slave trade was ratified. A convention with Russia was also concluded, by which America renounced the establishment of any settlement on the north-west coast, north or 54 deg. 40 min. north latitude.

On the following year, John Quincy Adams was inaugurated President of the United States.* It was a remarkable coincidence, that on the 4th day of July,

* In his speech to Congress, the president took a retrospective view back to the epoch of the confederation. "The year of Jubilee since the first formation of our union," observed Mr. Adams, "has just elapsed; that of the declaration of our independence is at hand. Since that period, a population of 4,000,000 has multiplied to 12,000,000. A territory bounded by the Mississippi has been extended from sea to sea. New states have been admitted to the Union, in numbers nearly equal to those of the first confederation. Treaties of peace, amity, and commerce, have been concluded with the principal dominions of the earth. The people of other nations, inhabitants of regions acquired, not by conquest, but by compact, have been united with us in the participation of our rights and duties, of our burdens and blessings." Having noticed the progress of agriculture and of settlements, of commerce and arts, of liberty and law, Mr. Adams thus sketches the features of the administration of the preceding president: "In his career of eight years, the internal taxes have been repealed; 60,000,000 of public debt have been discharged; provision has been made for the comfort and relief of the aged and indigent among the surviving warriors of the revolution; the regular armed force has been reduced, and the constitution revised and perfected; the accountability for the expenditure of public moneys has been made more effective; the Floridas have been peaceably acquired, and our boundary has been extended to the Pacific Ocean; the independence of the southern nations of this hemisphere has been recognised, and recommended, by example and by counsel, to the potentates of Europe; progress has been made in the defence of the country, by fortifications and the increase of the navy; towards the effectual suppression of the African traffic in slaves; in alluring the aboriginal hunters of our land to the cultivation of the soil and of the mind; in exploring the interior regions of the Union, and in preparing, by scientific researches and surveys, for the further application of our national

1826, exactly fifty years after the declaration of American independence, on the 4th of July, 1776, the ex-Presidents Jefferson and the elder Adams died.

In February this year a treaty with the Creeks was concluded, as the preliminary of removing all the Indians within the limits of any other state of the union to a territory, to be assigned to the Indian tribes, on the west of the Mississippi. All, except one tribe of the Creeks, assented, and ceded to the United States all their lands within the State of Georgia. The Kansas and Osages followed the example of the Creeks, and ceded their lands in Missouri.

The administration of Mr. Quincy Adams was prolific in its multiplicity of political dissensions. Charges of corruption against the executive, were brought forward with virulence, as well as with gravity, and with such hardihood and semblance of truth, as to acquire that credence, very generally among the citizens, which led to the non-re-election of Mr. Quincy Adams. He, however, is now believed to be utterly free from all the charges brought forward against him, and he certainly persevered in governing without the formation of, or adhering to, a party. This, no doubt, constituted his chief sin in the minds of his accusers.

The Congress of 1826-7, was remarkable for the many questions which were submitted to it by the executive, and those brought forward by senators and representatives. The federal republic was in a state of great commercial and fiscal prosperity. The post-office revenue yielded during the year a surplus of eighty thousand dollars above the expenditure of that department. The total net revenue of the United States was sufficient to spare 7,067,039 dollars for the reduction of the public debt, and 3,944,359 dollars for the payment of interest. The unsettled land claims in Florida and Louisiana; the works of internal improvement, reported by the board of engineers; the irregularities of the Brazilian and Buenos-Ayreal squadrons towards neutral flags; and the permanent increase of the navy of the United States, were impressively committed to the attention of congress.

It was considered that the treaty of the 22nd of April had terminated all disputes with the Creek Indians, but the provisions of this treaty were precipitated by governor Troup, who ordered the surveyors employed by him to enter the Creek territories and commence surveys, previous to the time prescribed by the treaty for their removal. The Indians resisted these encroachments, and the governor ordered out a force of militia. In this posture of affairs, the president determined to support the laws of the Union by the authority which the constitution had placed in his hands, previously submitting the affair to congress,

resources to the internal improvement of our country. In this brief outline of the promise and performance of my predecessor, the line of duty for his successor is clearly delineated. To pursue to their consummation those purposes of improvement in our common condition instituted or recommended by him, will embrace the whole sphere of my obligations."

to have it determined whether it were necessary to resort to any new measures. On the 5th of February he transmitted to both houses of congress a message, in which he gave a plain statement of facts, and declared his determination to enforce the laws, and fulfil the duties of the nation by all the force committed for that purpose to his charge. "That the arm of military force will be resorted to only in the event of the failure of all other expedients provided by the laws, a pledge has been given by the forbearance to employ it at this time. It is submitted to the wisdom of congress to determine, whether any further acts of legislation may be necessary or expedient to meet the emergency which these transactions may produce."

On the receipt of this message, the committee of the representatives, to which it was referred, reported that it "is expedient to procure a cession of the Indian lands in the state of Georgia, and that until such a cession is procured, the law of the land, as set forth in the treaty at Washington, ought to be maintained by all necessary, constitutional, and legal means." The governor of Georgia, in consequence, addressed a letter to the delegation of that state at Washington, submitting, on the part of his state, to the decision of congress, and, in consequence, the Creek lands in Georgia were finally ceded.

In Pennsylvania a state convention was nominated, to choose delegates to attend a general convention at Harrisburg on the 30th of July, 1827. Other states soon joined, and a crowded meeting of delegates was held at the appointed time. The reports of their committees on various subjects connected with domestic industry formed the basis of a Memorial to congress, drawn up in conformity with a demand for protection to manufacturing industry; and unanimously adopted. These proceedings were received in the southern states with justly merited dissatisfaction.

The United States, during the whole of Mr. Adams' administration enjoyed uninterrupted peace. The claims made on foreign governments by the United States government, on the part of the citizens for injuries, were persisted in with unexampled success. The author of the "Book of the United States," an eulogist of Mr. Adams, who considers him the most perfect of statesmen and of rulers, says,—

"A portion of these claims upon Sweden and Denmark was obtained, and the claims which arose against the Brazilian government, during the war between that power and Buenos Ayres, were speedily adjusted by the liquidation of the claims. The exorbitant pretensions of Great Britain respecting the West India trade were resisted, although at the expense of the direct trade between the United States and the British islands.

"The difficulties which occurred in carrying into effect the treaty of Ghent, relative to deported slaves, and other property taken away, having been found insurmountable, the sum of 1,204,960 dollars, which was amply sufficient, was

obtained from the British government in satisfaction of these claims. A convention was also concluded with that government, and a mode provided for the peaceable settlement of the long pending and finally threatening dispute concerning the north-east boundary of the United States. The treaty of commerce between the United States and Great Britain, and the convention effecting a temporary compromise of their conflicting claims to the territory west of the Rocky Mountains, both of which expired by their own limitation, October 20th, 1828, were renewed for an indefinite period, with liberty to either party to terminate them, on giving one year's notice. Some commercial difficulties, which grew out of an adherence of the government of the Netherlands to the principles of discriminating duties were adjusted to mutual satisfaction. New treaties of amity, navigation, and commerce,—in which the liberal principles maintained by the United States, in her commercial and foreign policy, were generally recognised,—were concluded with Colombia, Austria, Sweden, Denmark, Guatemala, and the Hanseatic league.

“It was, however, in the domestic policy of the government, that the character of the administration was most strongly displayed. During its continuance in office, new and increased activity was imparted to those powers vested in the federal government, for the development of the resources of the country; and the public revenue liberally expended in prosecuting those national measures to which the sanction of congress had been deliberately given, as the settled policy of the government.

“In the condition which we have described, in peace with all the world, with an increasing revenue, and with a surplus of 5,125,638 dollars in the public treasury, the administration of the government of the United States was surrendered by Mr. Adams, who became a private citizen, to General Jackson, his successor.

“Thus ended the administration of Mr. Adams ; an administration marked by definite and consistent policy and energetic councils, governed by upright motives, but from the beginning devoted to the most violent opposition and a signal overthrow. The election which terminated in the defeat of Mr. Adams was marked with extreme bitterness, asperity, and profligacy. On both sides the press was virulent, libellous, and mean. No privacy was safe, no confidence was sacred ; even the tombs of the illustrious dead were violated, and their ashes defiled. The arts of party warfare were more insidious than the arts of savage treachery, and its arms more ruthless than the tomahawk or the scalping knife. Calumny and falsehood were the usual resources of the most violent partisans, and the only weapons that they never for a moment laid aside. The *brave soldier* was described as a malignant savage, and the experienced statesman as a man who had purchased by intrigue a position that he was determined to maintain by corruption. It must be most sincerely hoped that an era may never again

arrive in our history to be stamped so indelibly with the brand of shame; that public opinion will ever require of the public press a more decent regard to the charities of life and the duties of truth.”*

There is much that is true, little that is positively false, but all appears exaggerated in this *eulogium*.

CHAPTER XI.

ADMINISTRATIONS OF GENERAL ANDREW JACKSON, GENERAL HARRISON,
PRESIDENT TYLER, AND PRESIDENT POLK.

ON the 4th of March, 1829, Andrew Jackson took the oath of office as President of the United States.†

In his first address he stated that—

“In administering the law I shall keep steadily in view the limitations as well as extent of the executive power, trusting thereby to discharge the functions of my office without transcending its authority.”

His recognition of the rights of the states, his view of the policy of standing armies, and of the power of a national militia, are all clearly and constitutionally presented.

“It will be my sincere and constant desire,” he continued, “to observe toward the Indian tribes within our limits a just and liberal policy; and to give that humane and considerate attention to their rights and their wants, which are consistent with the habits of our government and the feelings of our people.

“The recent demonstration of public sentiment inscribes, on the list of executive duties, in characters too legible to be overlooked, the *task of reform*; which will require, particularly, the correction of those abuses that have brought the patronage of the federal government into conflict with the freedom of elections, and the counteraction of those causes which have disturbed the rightful course of appointment, and leave place or continued power in unfaithful or incompetent hands.

* We were, during the period of this contested election in America, and though we do not consider the administration of Mr. Adams so faultless as the author of the “Book of the United States,” we are free to subscribe to the truth of nearly all his statements regarding the election in which Mr. Adams was defeated and General Jackson elected.

† The ceremony of his entering the senate is described as follows by the author of the “Book of the United States:”—

“He entered the senate chamber attended by the marshal of the district, and the committee of arrangements.

“The seats assigned them on the right of the president’s chair, were occupied by the chief justice of the United States, and associate judges.

“The foreign ministers and their suites, in their splendid official costume, filled seats on the left of the chair.

“The seats in the rear of the senators, and the lobby under the eastern gallery were occupied by ladies; while the western gallery was reserved for members of the House of Representatives.

“At noon, from the eastern portico of the capitol, in the presence of an immense concourse of people filling every approach, his inaugural address was delivered by the president; and the oath to support the constitution was administered to him by Chief Justice Marshall. This was announced by salutes from the capitol, repeated at the forts, and by detachments of artillery on the plains.

“The president was then conducted to his mansion, where he received the congratulations of the people.”

"In the performance of a task thus generally delineated, I shall endeavour to select men whose diligence and talents will insure, in their respective stations, able and faithful co-operation, depending, for the advancement of the public service, more on the integrity and zeal of the public officers than on their numbers.

"A diffidence, perhaps too just, in my own qualifications, will teach me to look with reverence to the examples of public virtue left by my illustrious predecessors, and with veneration to the lights that flow from the mind that founded, and the mind that reformed our system. The same diffidence induces me to hope for instruction and aid from the co-ordinate branches of the government, and for the indulgence and support of my fellow-citizens generally. And a firm reliance on the goodness of that Power whose providence mercifully protected our national infancy, and has since upheld our liberties in various vicissitudes, encourages me to offer up my ardent supplications that He will continue to make our beloved country the object of His divine care and gracious benediction."

A new cabinet was immediately nominated by him; each nomination of secretary being ratified by the senate without opposition. Mr. Martin Van Buren, the most prominent person of the cabinet, was appointed secretary of state. The other members of the cabinet were little known to the public. Mr. Calhoun was vice-president.

Mr. McLean, who had filled the office of postmaster-general, left his place deeply regretted. His patience, liberality, industry, reformation of abuses, and decision, had given much satisfaction to the country.

Mr. Van Buren, at the time of his appointment, was governor of the state of New York. This office he immediately resigned, and retired from his duties with the complimentary address of the legislature. His nomination was generally expected. He had been an ardent friend of General Jackson; and though the latter was in a great degree uncommitted as to his policy, it could hardly be expected that he would fail to consider Mr. Van Buren one of his men of "superior tact and experience." Mr. Barry, succeeded Mr. McLean as postmaster-general: the latter then took his place as one of the judges of the supreme court.

President Jackson then commenced the "task of reform," to which he had pledged himself, and which would demand, he observed, "the correction of abuses, which had brought the patronage of the federal government into conflict with the freedom of elections, and the counteraction of those causes, which had disturbed the rightful course of appointment, and had placed or continued power in unfaithful or incompetent hands." He soon removed, "by force of his construction of the right of the executive to fill vacancies occurring in the recess, many officers in the treasury department, and ordered a great change in the diplomatic body;" and he sent ministers plenipotentiary to Great Britain, France, Netherlands, and Spain.

In the post-office his, almost total, changes were complained of as unconstitutional, unprecedented, and dangerous. Many of the leading newspapers de-

nounced this policy. The report of the postmaster-general, in answer to a resolution of the senate, "declared the removal of 491 postmasters, between the 4th of March, 1829, and 22nd of March, 1830."

The patronage of the president was severely condemned "as utterly at war with that doctrine of securing the independence and purity of the national legislation." His friends defended him "as one who was solely invested with the right of removal; that it was a discretionary right, for the exercise of which he was responsible solely to the nation; that that power was given to enable him, not only to remove incumbents for delinquency or incapacity, but with the view of reforming the administration of the government, and introducing officers of greater efficiency, or sounder principles, into its various departments. Occasion was also taken, owing to the defalcation of a few of those removed, to assert the necessity of reform, and great efforts were made to create an impression on the public mind of the necessity of a general removal of the officers of the federal government."*

The merchants of New York presented a memorial, drawn up with great ability, seeking the interference of government in their claims upon France for spoliations upon their property during Napoleon's rule.

The shipping trade of the United States had, during the years previous to 1828, rapidly increased.†

On the 7th of December the first session of the twenty-first congress commenced. The president observed, "that there were subjects of deep interest yet unsettled between the United States and foreign countries, but that foreign relations were considered, in a general view, as peaceful and promising. With England the 'disputed territory' question was still open. It was regarded, however, as in fair progress towards a final and satisfactory settlement. The controversy between the two governments respecting the trade between the United States and the West Indies was also still kept up. But certain concessions which we had made to the British government being satisfactory, measures were now in train for a renewal of the trade."

In respect to the claims of American citizens on France, the president informed congress that he had "instructed our minister to press these demands on the French government, with the earnestness called for by their importance and irrefutable justice, and in a spirit that would evince the respect which is due to the feelings of those from whom the satisfaction is required."

He recommended "such an amendment of the constitution as would remove all intermediate agency in the election of president and vice-president." "The mode," said he, "may be so regulated as to preserve to each state its present

* Annual Register.

† See Shipping of the United States, vol. ii.

relative weight in the election ; and a failure in the first attempt may be provided for, by confining the second to a choice between the two highest candidates. In connexion with such an amendment, it would seem advisable to limit the service of the chief magistrate to a single term, of either four or six years."

He expressed his belief that the "most safe, just, and federal disposition, which could be made of the surplus revenue, would be its apportionment among the several states according to their ratio of representation ; and should this measure not be found warranted by the constitution, that it would be expedient to propose to the states an amendment authorising it."

In regard to the Indian tribes within the limits of the United States, he said,—

"Surrounded by the whites, with their arts of civilisation, which, by destroying the resources of the savage, doom him to weakness and decay ; the fate of the Mohegan, the Narragansett, and the Delaware, is fast overtaking the Choctaw, the Cherokee, and the Creek. That this fate surely awaits them, if they remain within the limits of the states, does not admit a doubt. Humanity and national honour demand that every effort should be made to avert so great a calamity. It is too late to inquire whether it was just in the United States to include them and their territory within the bounds of new states, whose limits they could control. That step cannot be retraced. A state cannot be dismembered by congress, or restricted in the exercise of her constitutional power. But the people of those states, and of every state, actuated by feelings of justice and regard for our national honour, submit to you the interesting question, whether something cannot be done, consistently with the rights of the states, to preserve this much injured race.

"As a means of effecting this end, I suggest, for your consideration, the propriety of setting apart an ample district, west of the Mississippi, and without the limits of any state or territory, now formed, to be guaranteed to the Indian tribes, as long as they shall occupy it ; each tribe having a distinct control over the portion designated for its use. There they may be secured in the enjoyment of governments of their own choice, subject to no other control from the United States than such as may be necessary to preserve peace on the frontier and between the several tribes. There the benevolent may endeavour to teach them the arts of civilisation ; and by promoting union and harmony among them, to raise up an interesting commonwealth, destined to perpetuate the race, and to attest the humanity and justice of the government.

"This emigration should be voluntary : for it would be as cruel as unjust to compel the aborigines to abandon the graves of their fathers, and seek a home in a distant land. But they should be distinctly informed that, if they remain within the limits of the states, they must be subject to their laws. In return for their obedience, as individuals, they will, without doubt, be protected in the enjoyment of those possessions which they have improved by their industry."

On the great fiscal and currency question of the renewal of the charter of the bank of the United States, he observed,—

"Both the constitutionality and the expediency of the law creating this bank, are well-questioned by a large portion of our fellow-citizens ; and it must be admitted by all, that it has failed in the great end of establishing a uniform and sound currency.

"Under these circumstances, if such an institution is deemed essential to the fiscal operations of the government, I submit to the wisdom of the legislature, whether a national one, founded upon the credit of the government and its revenues, might not be devised, which would avoid all constitutional difficulties, and, at the same time, secure

all the advantages to the government and country that were expected to result from the present bank."

The fate of the Indians within the then states and territories was considered as sealed. The alternative of removal or extermination seemed only to be left them.*

* An intelligent writer observes of the Cherokees, a powerful tribe within the limits of Georgia : — " From the adoption of the federal constitution, treaties had, from time to time, been made with them. In 1785 they were, by the treaty of Hopewell, received into the favour and under the protection of the United States. In 1791, another treaty was made with them at Holston, acknowledging the territory which they inhabited to be theirs. Other treaties followed in subsequent years. In 1827, the tribe adopted a written constitution, which, as it destroyed the hope indulged by Georgia of an early removal of it from her territory, excited the state to a great degree. That territory had been recognised as hers by the general government, which had agreed to extinguish the title so soon as it could be done in peace and reason. Georgia soon asserted her jurisdiction over the whole territory.

" A change having taken place in the administration of the federal government, was followed by a change in its policy towards the Indians in the United States. Soon after the inauguration of General Jackson, he conceded to Georgia full power as a sovereign state to extend her civil and criminal jurisdiction over all the Indians within her limits : and that the treaties made with the United States, so far as they contravened this authority by guaranteeing the Indian title, were not binding upon the general government, inasmuch as it had not a constitutional right to make such treaties.

" These new views adopted by the executive in relation to the obligations of the United States towards these Indians, and the severe laws of Georgia of 1830, by which the Cherokee laws and customs were declared to be *void*, and their territory ordered to be divided, excited deep feeling in all parts of the United States.

" In his message, the president had brought forward a formal proposal to set apart a territory beyond the Mississippi, to which they might remove. This subject was referred by both houses of congress to their respective committees upon Indian affairs, and on the 22nd of February, 1830, the committee of the senate made a long report to that body, approving the recommendation of the executive, accompanied by a bill to carry it into effect. The president was also authorised to exchange these districts with any tribes thereof residing within the United States, for the land occupied by them, and to assure them that the United States will secure such land to them and their posterity for ever ; and a patent was to be granted to them to that effect. He was authorised to pay for the Indian improvements on the exchanged lands, and upon the payment of the appraised value, the improvements were to belong to the United States. He was to cause the emigrants to be assisted in removing and settling in their new country, to provide for their sustenance for the first year after their removal, and to protect them in their new residence against all other tribes or persons.

" It purported to be a law to aid the Indian in emigrating beyond the Mississippi, and did not contemplate any other than a voluntary removal.

" The laws of Georgia now authorised an intrusion upon the Indian territory for the purpose of surveying it, and in extending the jurisdiction of the state over it, in effect rendered it subject to the intrusion of any person.

" The laws of the states thus came directly in conflict with those of the United States ; and as the president had determined not to execute the law of congress, when it conflicted with state sovereignty, he in that manner adopted the state laws as part of the national policy, and this bill thus passed by congress, although not in terms yet in effect, came in aid of the local policy of those three south-western states, sanctioned as that policy was by the new federal administration.*

The Cherokees refused to accede to these propositions, and determined to maintain, by all the means in their power, their rights as guaranteed by treaty.

" The government of Georgia, however, commenced the execution of what it threatened under the preceding administration. George Tassell, a Cherokee, was arrested for the murder of another Cherokee, tried, and condemned. This cause was carried to the superior court of the United States. A citation was served upon Governor Gilmer, requiring the state of Georgia to appear and show cause why the judgment should not be reversed. The governor transmitted this citation to the legislature, which body enjoined the governor to disregard the summons, and ordered Tas-

* Annual Register.

Samuel Worcester and other missionaries in Georgia were arrested by order of the governor, and taken before the court of Gwinnet county, "for refusing to obtain a permit from the government of Georgia to reside within the territory, or to take an oath of allegiance to the state." Worcester and Thompson, although missionaries, were discharged by the court on "the alleged ground that they were agents of the government, having been employed to disburse among the Indians a portion of their annuities." This decision gave great offence to the state authorities, and the general government disavowed that the missionaries were its agents. Worcester and Ezra Butler were warned to quit the nation, and not complying, they were arrested, tried, and sentenced to four years hard labour in the penitentiary of Georgia.

Great indignation was manifested throughout the union at this violation of personal rights, and a complete disregard of the federal compact, and the faith of treaties. The president supported Georgia in the ground she had taken, and carrying out her policy towards the Cherokees.

But the case of the missionaries was brought before the supreme court of the United States. The decision of that court in March, 1832, set aside the authority assumed by Georgia as unconstitutional; and the laws, by which the Indians had been deprived of their rights, and the missionaries imprisoned, were pronounced null and void.

Georgia resisted this decision of the supreme judicial tribunal of the United States, and the missionaries were still continued in prison.

In January, 1833, the missionaries addressed a letter to the governor of Georgia, informing him that they had forwarded instructions to their counsel to prosecute the case no further, upon which they were discharged.

The debate in the senate respecting the public lands, was introduced on the 29th of December, 1829.*

This resolution was immediately and strongly opposed, as a part of a systematic policy for crippling the growth of the west. It was urged that it would serve to prevent emigration to those states within whose territory these lands lay. The debate to which this resolution gave rise continued for several weeks.

In his message to congress the president had expressed an opinion against renewing the charter of the United States Bank, which would expire in 1836. The bank had not applied for such renewal, but being pressed on the attention

sel to be executed, which was accordingly done on the 28th of December, 1830. In the meanwhile, a detachment of United States troops was ordered by the president to prevent any encroachment on the Indian territory. These were, however, soon after withdrawn, and their place supplied by Georgia militia to prevent disturbances."—*Book of the United States.*

* This debate was grounded on the following resolution:—"Resolved, that the committee on public lands be instructed to inquire into the expediency of limiting, for a certain period, the sales of the public lands, to such lands only as have heretofore been offered for sale, and are subject to entry at the minimum price, and also whether the office of surveyor-general may not be abolished without detriment to the public interest."

of congress, it was referred to the committees on finance in both houses of congress for examination.

On the 30th of April, 1830, Mr. McDuffie, the chairman of the committee of ways and means in the house, made a report diametrically opposite to the recommendations of the president.*

The impression now became general that the president adopted, as constitutional, "the power to remove officers at pleasure, though appointed for certain periods, and that without rendering any special reason for so doing. This principle was for a long time and strenuously discussed in the secret sessions of the senate."

Among the bills which were passed by congress at this time, was one authorising the mounting and equipment of a part of the army of the United States to *protect* the trade with the interior provinces of Mexico.

Nullification doctrines were held at this period, and paying off the national debt was another subject of discussion.

The British government opened the intercourse between the United States and the British West India colonies, and the president, on the 5th of October issued his proclamation to that effect.

The second session of the twenty-first congress commenced on the 6th of December. The message of the president was remarkable for its length.

The policy of removing the Indians was insisted upon.

The *constitutionality* of the protecting system was fully allowed; but the *expediency* of retaining certain duties was made a reserved question.

The public debt was declared to be in a course of rapid redemption; while the opposition to the bank of the United States was manifested with fresh energy, and another plan suggested as a substitute.

The proceedings of the judicial committee of the house were of great import, and commanded the deepest attention. There was a report both from the majority and the minority. The division was four against them in the latter. The bill appended to the former: to repeal the twenty-fifth section of what was called the "judiciary act," was rejected on its first reading by a vote of 137 to fifty-one. The country, on the whole, was to be congratulated on this issue. The idea of destroying the powers of the supreme court—the only tribunal of ultimate appeal for the union, was regarded as too wild to be for a moment encouraged by a rational people.

Political feeling was strongly manifested, especially at Washington, for eight or ten days before the close of the session. Early in the spring of 1831, there was a dissolution of the cabinet.

* See Banking and Currency of the United States, Vol. ii.

James Munroe, ex-president of the United States, died on the 4th of July, 1831, he was a statesman of very great acquirements.*

The new cabinet, constituted during the summer, consisted of Edward Livingston, Secretary of State, Lewis M^cLane, Secretary of the Treasury, Lewis Cass, Secretary of War, Levi Woodbury, Secretary of the Navy, Roger B. Taney, Attorney General.

Popular sentiment was excited at the same time relative to the next election of president and nominations. General Jackson was withdrawn as a candidate by "certain of his *original supporters*" in Philadelphia, who issued a public declaration, that "the identity of his political character" was destroyed by "time, circumstances, and power," and that their support was rendered him no longer.

In consequence of an atrocious murder at Niagara, of a person who was said to reveal the pretended secrets of freemasonry, a national anti-masonic convention, in September of this year, nominated William Wirt, of Maryland, as President of the United States, and Amos Ellmaker of Pennsylvania, as vice-president. These nominations were accepted.

Two events caused much attention about this same time throughout the country. The one was the disclosures made in the report of the directors on the condition of the bank of the United States (*See Currency and Banking, Vol. ii.*). The other was the formation of the "free trade convention;" the address and proceedings of which assumed an *imperative* tone, and they declared the tariff laws "unconstitutional."

A "tariff convention" followed that of the "free trade convention," the address assumed to itself "the tearing the arguments of the free traders to tatters, and scattering them to the winds of heaven."

The treaty, settling the claims of American citizens on France for spoliations during Napoleon's government, was signed by Mr. Rives and Count Sebastiani,

*"Mr. Munroe was born in Virginia, in 1759, and was educated in William and Mary College. He entered the revolutionary war, in 1776, as a cadet, was at the battles of Haerlem Heights and White Plains, and in the attack on Trenton, and rose through the rank of lieutenant to that of captain. He was present at the battles of Brandywine, Germantown, and Monmouth, as aid to Lord Sterling. Resuming the study of the law, he entered the office of Mr. Jefferson, and after being a member of the assembly of Virginia and the council, he was elected, in 1783, a member of the old congress. In 1790, he was elected a member of the senate of the United States, in 1794, went as minister plenipotentiary to France, and in 1799, was appointed governor of Virginia. In 1803, he was appointed minister extraordinary to France, in the same year minister to London, and in the next, minister to Spain. In 1806, he was again appointed, in conjunction with Mr. William Pinckney, minister to London. He was subsequently governor of Virginia; in 1811, was appointed secretary of state, and continued to exercise the duties of this department, and for some time those of the department of war, till 1817. In that year he was chosen president of the union, and in 1821 was re-elected by a vote unanimous, with the single exception of one vote in New Hampshire. He died in New York, on the 4th of July, 1831."—*Book of the United States.*

at Paris, on the 4th of July, 1831, and soon after ratified by the United States and France.

France agreed to pay in full satisfaction of the claims of American citizens, 25,000,000 francs in six equal annual instalments—an amount by no means adequate to the value of property confiscated by Napoleon. On their part the United States consented to pay to the government of France 1,500,000 francs in satisfaction of claims on Americans.

The first session of the 22nd congress met on the 5th of December, 1832. The message dwelt chiefly on *foreign* affairs. The treasury report produced a sensation from its bearing upon the bank of the United States, and created suspicion as well as excitement.

The speeches upon the “American or *protective* system,” and those on *free trade*, divided public opinion according to sentiment and personal interest, far more than on any sound principle.

The debate on the nomination of Mr. Van Buren as minister to England, and his rejection by the casting vote of the vice-president, caused much party excitement.

The north-eastern boundary question was agitated at this time by the legislature of Maine. The “closed-door” manner of proceeding on that question, at Augusta, and the “*hurried action*,” as it was called, of Maine, caused much and severe comment. “The sum and substance of the facts, as reported are, that the state authorities have been advised from Washington to acquiesce in the decision of the King of the Netherlands, in expectation that congress will make compensation for the land in dispute, in money, or a grant of land elsewhere. The reserved papers, however, would show all the merits of the case. There appeared to be some difficulty in the way of the arrangement suggested, if the decision of the Dutch king is right, the United States cannot pay Maine for the land; if wrong it ought not to be submitted to.”

Tariff and protective bills, reports on sales of public lands, and currency questions, occupied congress. A bill renewing the charter of the bank of the United States passed both houses; *vetoed* by the president, and a financial crisis succeeded.—(See Currency, Vol. ii.)

During the spring of 1832, hostilities were commenced by the Sac and Fox Indians, on the western borders of the United States, under their celebrated chief Black Hawk. After a harassing warfare, prolonged by the nature of the country, the Indians were defeated, and Black Hawk and the Prophet were taken prisoners.

The second session of the twenty-second congress commenced on the 3rd of December, 1832. The president represented the relations of the country with

foreign powers in a state of amity. The claims made on Portugal had been allowed.

The treasury report represented the finances in a prosperous condition. A diminution of duties on imports, or a partial "relinquishment of the public lands as a source of revenue" was recommended, to effect a reduction of the national income.

The message of the president was followed on the 10th of December, by proclamation, addressed to the citizens of the United States, in relation to the hostile attitude of South Carolina to the union, in consequence of the tariff acts of congress of the 29th of May, 1828, and of the 14th of July, 1833, altering and amending the several acts imposing duties on imports, which acts had, in a convention of the above state, held at Columbia, November 24th, been pronounced to be unconstitutional, and therefore void, and of no binding force within the limits of that state.

For a considerable period the southern states, with the exception of South Carolina, had been considered opposed to the exercise of power by the federal government. This state, although voting with the adjacent states on all local, and on most national questions, had on some occasions, as in 1816, been foremost in asserting the right of congress to legislate on certain disputed points. Among these were the subjects of internal improvement, the United States bank, and the tariff. A change of opinion had now taken place in Carolina, and it began to go beyond any of the advocates of state rights, in its assertion of state sovereignty. A vehement opposition to the tariff, both in 1824, and on the subsequent modification in 1828, had been led by the delegation from South Carolina in congress, and when they were defeated in Washington they renewed their efforts to overturn the system and to render it unpopular with the people.

At first it was contemplated to resign their seats in congress; and a meeting of the delegation was held at Washington with the view of deciding upon the steps which should be taken.

The delegation, however, did not concur in adopting violent measures, and it was determined to endeavour, upon their return home, to rouse their constituents to a more effectual opposition to the protecting system. No exertions were spared to excite public feeling against the law. It was denounced as a measure local in its character, partial and oppressive in its operation, and unconstitutional in principle.

Having convinced themselves of this, they began to question the right of the federal government to require obedience, and almost simultaneously with the legislature of Georgia, which December 24th, 1827, resolved to submit only to its own construction of the federal compact, the senate of South Carolina instituted

a committee to inquire into the powers of the federal government, in reference to certain subjects then agitated.—(See *American Annual Register*.—See also Mr. Upshur "On the Constitution of the United States" in the supplement to this volume; and Mr. Spencer's review of Mr. Upshur's Opinions, Vol. ii.)

The report of this committee, which received the sanction of the state senate on the 12th, and of the house on the 19th of December, 1827, "*it asserted that the federal constitution was a compact originally formed, not between the people of the United States at large, but between the people of the different states as distinct and independent sovereignties; and that when any violation of the letter or spirit of that compact took place, it is not only the right of the people, but of the state legislatures to remonstrate against it, that the federal government was responsible to the people whenever it abused, or injudiciously exercised powers intrusted to it, and that it was responsible to the state legislatures, whenever it assumed powers not conferred!*"

Admitting that, under the constitution, a tribunal was appointed to decide controversies, where the United States was a party, it was contended in this report, "that some questions must occur between the United States and the states, which it would be unsafe to submit to any judicial tribunal. The supreme court had already manifested an undue leaning in favour of the federal government; and when the constitution was violated in its spirit, and not literally, there was peculiar propriety in a state legislature undertaking to decide for itself, inasmuch as the constitution had provided no remedy."

The report declared "all legislation for the protection of domestic manufactures to be unconstitutional, as being in favour of a local interest, and that congress had no power to legislate except upon subjects of general interest." "The power to construct roads and canals, within the limits of a state, or to appropriate money for that purpose," was also denounced "as unconstitutional, as well as all legislation for the purpose of meliorating the condition of the free coloured or the slave population of the United States."

The resolutions of the state legislature expressive of these principles, having passed both houses, they were transmitted, with the report, to the delegation from Carolina, in congress, to be laid before that body, then engaged in the consideration of the protective tariff.

That tariff bill having passed through congress, the legislature of South Carolina, at its next session, protested against it "as unconstitutional, oppressive, and unjust," this protest was transmitted to their senators in congress to be entered upon the journals of the senate. The doctrine of the right of a state to nullify an act of congress, was not relinquished by Carolina.

"The legislature of Virginia," says a writer in the *Annual Register*, "also declared its assent to the principle of nullification, and judging from the opinions expressed by the public functionaries of those states, the time appeared to be near at hand when the union was about to be dissolved by the determination of a large section not to submit to the

laws of the federal government, nor to any common tribunal appointed to decide upon their constitutionality."

In the latter end of November, a state convention assembled at Columbia, which passed an ordinance, declaring, "That the tariff acts are not authorised by the constitution of the United States, and violate the true meaning and interest thereof, and are null and void, and no law," binding on the citizens of that state or its officers; and by the same ordinance it is "further declared to be unlawful for any of the constituted authorities of the state, or the United States, to enforce the payment of the duties imposed by the said acts within the same state, and that it is the duty of the legislature to pass such laws as may be necessary to give full effect to the said ordinance."

An address was promulgated by the same convention, in which it is contended that "it does not belong to freemen to count the costs, and calculate the hazards of vindicating their rights and defending their liberties; and even if we should stand alone in the worst possible emergency of this great controversy, without the co-operation or encouragement of a single state of the confederacy, we will march forward with an unfaltering step, until we have accomplished the object of this great enterprise."

President Jackson immediately issued a proclamation, appealing to Carolina and to the other states, which were perhaps ready to join the standard of nullification, to remember the toil and blood which American liberty cost, the sacredness of the constitution, and the importance of the preservation of the Union. "There is yet time to show," said the president, "that the descendants of the Pinckneys, the Sumpters, the Rutledges, and the thousand other names which adorn the pages of your revolutionary history, will not abandon that union to support which so many of them fought, and bled, and died. I adjure you, as you honour their memory—as you love the cause of freedom to which they dedicated their lives—as you prize the peace of your country, the lives of its best citizens, and your own fair fame, to retrace your steps. Snatch from the archives of your state the disorganising edict of its convention—bid its members to re-assemble and promulgate the decided expressions of your will to remain in the path which alone can conduct you to safety, prosperity, and honour—tell them that compared to disunion, all other evils are light, because that brings with it an accumulation of all—declare that you will never take the field unless the star-spangled banner of your country shall float over you—that you will not be stigmatised when dead, and dishonoured and scorned while you live, as the authors of the first attack on the constitution of your country! Its destroyers you cannot be. You may disturb its peace—you may interrupt the course of its prosperity—you may cloud its reputation for stability—but its tranquillity will be restored, its prosperity will return, and the stain upon its national character will be transferred, and remain an eternal blot on the memory of those who caused the disorder."

The legislature of South Carolina, being in session, authorised the governor to issue a counter-proclamation, which was published on the 20th of December. He solemnly warned the citizens of South Carolina against all attempts to seduce them from their primary allegiance to the state. "I charge you," said he, "to be faithful to your duty, as citizens of South Carolina, and earnestly exhort you to disregard those 'vain measures' of military force, which, if the president, in violation of all his constitutional obligations, and your most sacred rights, should be tempted to employ, it would become your solemn duty, at all hazards, to resist."

General orders were issued, by authority of the legislature, to raise volunteer companies, troops, battalions, &c., for the purpose of repelling invasion, and in support of the rights of the state.

The president, on the 16th of January, 1833, addressed a message to congress, in which, after sketching a history of proceedings, both on the part of Carolina, and the general government, he "recommended the adoption of such measures as would clothe the executive with competent power to suppress the rising spirit of insubordination, sustain the public officers in the discharge of their duties, and give power to the courts to carry out their constitutional decisions."

Meantime an appeal was made by the general assembly of Virginia to the "patriotism and magnanimity" of South Carolina.*

The appeal from Virginia and the passing of a bill introduced by Mr. Clay, termed the compromise bill, by congress, was followed by a convention held in South Carolina, which recommended an ordinance, repealing the nullification ordinance.†

* These resolutions were as follow :—

"1. Resolved, therefore, by this general assembly, in the name, and on behalf of the people of Virginia, that the competent authorities of South Carolina be, and they are hereby earnestly and respectfully requested to rescind the ordinance of their late convention, or to suspend its operation until the close of the first session of the next congress.

"2. Resolved, That the congress of the United States be, and they are hereby earnestly and respectfully requested so to modify the tariff laws, as to effect a gradual but early reduction of the revenue of the general government to the necessary and proper expenditures thereof.

"3. Resolved, that the people of Virginia expect, and in the opinion of this general assembly have a right to expect, that the general government, and the government of South Carolina, and all persons acting under the authority of either, will abstain from all acts calculated to disturb the tranquillity of the country, or endanger the existence of the union."

† The ordinance was as follows:—

"Whereas, the congress of the United States, by an act recently passed, has made such a reduction and modification of the duties upon foreign imports, as amounts substantially to an ultimate reduction of the duties to the revenue standard, and that no higher duties shall be made than may be necessary to defray the expenditures of the government :—

"It is therefore *ordained and declared*, that the ordinance entitled, 'an ordinance to nullify certain acts of the congress of the United States, purporting to be laws laying duties on the importation of foreign commodities,' and all acts passed in pursuance thereof, be henceforth deemed and held to have no force or effect; provided that the act entitled 'an act further to alter and amend the militia laws of this state,' passed on the 20th day of December, 1832, shall remain in force until it shall be repealed or modified by the legislature."

In connexion with this subject, we quote the following remarks, as expressive of the opinions of a large class of the people at this time. "It will be seen, by reference to Mr. Calhoun's letter, and the speech of Governor Hayne and General Hamilton, that an exercise of the 'right of nullification' by the state of South Carolina, having caused the recent adjustment of the tariff, is hereafter to be held as the 'rightful remedy' in either of the twenty-four states, for the redress of any

Congress adjourned on Friday morning, March the 1st, 1833, at one o'clock. On the following Monday, General Jackson, who had been re-elected president, was inaugurated, and his address was received with the most popular applause. The president recognised the "importance of state rights, but insisted upon the equal, if not superior value of the union, and the sacred duty of every state to contribute to its preservation by a liberal support of the general government."

During the summer of 1833, President Jackson visited Philadelphia, New York, and New England, as far as Concord in Massachusetts.

He was received, in every place through which he passed, with demonstrations of respect and attention. Whatever opinions were entertained by his political opponents, they united in every expression of honour to the person whom the majority had elevated to the highest office in the state.

Mr. Louis M'Lane at this time succeeded Mr. Edward Livingston, as secretary of state. The latter was soon after appointed envoy extraordinary and minister plenipotentiary of the United States to the court of France. Mr. Livingston was one of the ablest lawyers of the age.

In September, 1834, a communication was read to the cabinet by the president, in which he declared that his own mind was determined upon the removal of the government deposits from the bank of the United States; and he begged his cabinet "to consider the proposed measure as his own, in which he should require no one to sacrifice opinion or principle."

The first session of the twenty-third congress commenced on the 2nd of December, 1836, and exciting movements immediately commenced with it.

Two of the leading topics which occupied the message were the defalcation of France, in fulfilling the contract of the convention of the 4th of July, 1831, and the removal of the public money from the bank of the United States.—(*See details of the Finances of the United States, Vol. ii.*)

A few days before the close of the session, Andrew Stevenson was nominated minister plenipotentiary to the court of London, and Roger B. Taney secretary of the treasury. The latter had received his appointment from the president during the recess of the senate. It was urged that it had been the uniform practice for appointments of this kind to be laid before the senate at the commencement of the session; but that General Jackson had withheld his name till near its close, and that for nearly seven months Mr. Taney had been permitted to discharge the duties of an office, which, according to the substantial meaning, if not the literal construction of the constitution, he had no right to hold. On the other hand, it was contended that had his name been sent in on the first day of the session, and had he on that first day been rejected, he would still have had a right, under the constitution, to hold office till the close of the session. As a matter of delicacy it would not have been done. But the president, by the constitution,

real or imaginary evil, arising out of the laws of the United States, or the decisions of the supreme court. And though nullification has not been formally acknowledged in congress, as the 'rightful remedy,' it certainly has been respected as an efficient one."—*Nile's Register*.

has power to give a commission continuing till the *end* of the next session of congress. This is the supreme law.

Mr. Stevenson's appointment was rejected by the senate on a principle early attributed to General Jackson, "that the appointment of members of congress to important offices was calculated to introduce corruption into the government." Among other reasons for his rejection was the disclosure, imputed to have been made to the senate, of the assurance of the president some months previously, through the secretary of state, to Mr. Stevenson, that he should have the appointment. This promise was construed as having been made under the expectation that Mr. Stevenson would carry out the views and measures of the executive, and this construction of the appointment caused its rejection, as a nomination deemed highly improper. It is true that Mr. Stevenson was of the same party as President Jackson; and would of course carry out the views and measures of the executive. It would have been dishonourable, while in office, to prove false to his party and political friends. If he differed conscientiously from his colleagues, the usual alternative, that of resigning, was alone open to him.

Mr. Stevenson had been the late speaker of the house. The appointment to London was alleged to have been reserved for him, and kept in abeyance for more than fifteen months. The accusations were, "That a more direct, daring, and dangerous influence, brought to bear in a critical period, by the president, upon the presiding officer of the house, could not well be imagined; and if the senate had confirmed the nomination of Mr. Stevenson, all further resistance to the appointment of members of congress, under any circumstances, would be vain and useless." These accusations were, however, party charges.

The second session of the twenty-third congress assembled December 1, 1834. The president stated in his message, that "all foreign relations were unimpaired; and with all countries, save France, the understanding was such as was desirable; but that France was still inclined to continue her refusal of the settlement of the claims which she had conceded. This conduct awakened a general discontent throughout the United States. The country, he said, should insist on a prompt execution of the treaty; and if an appropriation was not made at the next session of the chambers, decided measures would be not only honourable and just, but have the best effect on the national character. If the neglect continued, he recommended a law authorising reprisals on French property." We have examined this question with care, and the policy of the president was dignified and just.

The hostility of the president to the bank of the United States was thus stated in his message:

"It has," says he, "become the scourge of the people. Its interference to postpone the payment of a portion of the national debt, that it might retain the public money appropriated for that purpose, to strengthen it in a political contest—the extraordinary extension and contraction of its accommodations to the community—its corrupt and partisan loans—its exclusion of the public directors from a knowledge of its most im-

portant proceedings—the unlimited authority conferred on the president to expend its funds in hiring writers, and procuring the execution of printing, and the use made of that authority—the retention of the pension money and books after the selection of new agents—the groundless claim to heavy damages, in consequence of the protest of a bill drawn on the French government, have, through various channels, been laid before congress.”

The public and mercantile distress was charged by the president to the mismanagement of the bank, and a separation of this institution from the treasury was strongly urged. The attention of congress was earnestly invited to the regulation of the deposits in the state banks. The subject of internal improvements was discussed, and the inexpediency and unconstitutionality of appropriations, therefore, without an amendment of the constitution, again maintained. This discussion arose from the president’s refusal to sign an appropriation bill to improve the Wabash river.

At this time Richard Lawrence attempted to assassinate the president by firing at him. He was declared insane.

In France the American indemnity bill passed the chambers by a very large and unexpected majority.

John Marshall, chief-justice of the United States, one of the most learned and upright judges that ever adorned the bench, or honoured the age, died at Philadelphia on the sixth day of July, in the eightieth year of his life.

The surplus revenue at the end of the current year, 1835, exceeded *twenty millions of dollars*. The sale of the public lands had realised a greater amount than during any previous year—the customs also yielded a much larger amount.

The twenty-fourth congress assembled in its first session on the 7th of December, 1835, and James K. Polk was elected speaker.

The difficulties with France were managed through the implied mediation of England. In his message the president stated that the claims of France were settled by “honourable means,” and a war was avoided which Mr. Clay declared in the senate would have been the “scandal of an enlightened age.”

According to Mr. Ewing’s report to the senate, the surplus revenue from sales of public lands *alone*, during that year, “would amount to twenty-seven millions of dollars. In the course of another year, at this rate, the surplus revenue would amount to fifty millions of dollars.”

Among the appointments by the president, at this period, were those of Roger B. Taney, as chief justice of the United States, and Andrew Stevenson minister to Great Britain. The last was strongly opposed in the senate.

In March, 1836, Mr. Benton introduced into the senate his “expunging resolution”—the object of which was to erase from the record of that chamber the resolve of the 28th of March, 1834, charging the president with the assumption of unconstitutional power. This resolution was strongly opposed, but finally carried. Mr. Webster read a strong protest against the proceeding, in behalf of himself and his colleague, from Massachusetts.

The committee on naval affairs, in the senate, at this time reported a bill directing an "exploring expedition" to the Pacific Ocean and the South Seas, and authorising the president to send out a sloop of war for that purpose.

In April an act passed congress "establishing the territory of Wisconsin." In June, Arkansas was admitted into the union on an equal footing with the original states, together with Michigan. The act of admission settled the boundary dispute between Ohio and Michigan.

On the 17th of June the deposit bill passed the senate. It was qualified in the house, in a manner which removed the constitutional objections of the president, and it received his signature.

Congress adjourned on the 4th of July, without deciding on any other question of much importance. General Lewis Cass was appointed minister to France.

On the 11th of July a circular was issued, from the treasury department, in relation to moneys to be received in payment for public lands. By its directions receivers were, after the 15th day of next August, to take in payment for such lands, only gold and silver; and, in certain places, the land scrip of Virginia. All receivers were prohibited from accepting for land sold, any certificate or draft, or other *evidence of money*, or *deposit*, though for specie, unless signed by the treasurer of the United States, agreeably to the law of April 24th, 1820.

The last annual message of General Jackson to congress was delivered on the 6th of December, 1836.

In regard to the disputes between America and Mexico, the president sent a message to the senate, and on the 18th of February, 1837, a report was presented by the senate concurring in opinion with the president, that another demand should be made for redress of grievances on the Mexican government, but no reprisals were recommended in case of a refusal to comply with this demand.

The president's message stated, that the deposit or distribution act, passed by the preceding congress had received his "reluctant approval," and "the consequences apprehended from it had been measurably realised."

The president represented the "specie circular" of the 11th of July, as producing "many salutary consequences." The people of the United States were not generally of this opinion; experience has made them think more justly.

The administration of Andrew Jackson was now ended. He always retained the love and confidence of the people, but had no reliable majority in either branch of the legislature. Yet he had exercised, from the general confidence in the rectitude of his character, and in his love of justice, the power almost of a dictatorship for eight years: nearly about the same period as that of the supreme rule of Oliver Cromwell. But unlike the closing days of the Protector, Andrew Jackson did not depart from power and from life at the same hour. He did not, by a nod, appoint his successor. He, as a simple citizen, rode away from the White House, and the political strife of the republic, for the retirement and silence of his solitary Hermitage, amidst the forests of the west.

The retreat of the iron-minded ruler, but mild and gentle citizen, to a rustic habitation, surrounded by the vast wilderness beyond the Alleghany mountains: a region which the white man had scarcely ever trodden before the year 1780, is, in the reflection, accompanied, in spite of our philosophy, with a portion of that which is sorrowful in the feelings of the spectators, yet tranquillising to those whose minds are conscious of doing their duty to mankind, although they may have experienced the ingratitude of their generation.

The person and existence of the former ruler and statesman, in his after solitude, presents a transition and preparatory state—a tranquillity foreboding the final departure, from the visible present, to the mysterious future.

The example is not unknown among ourselves; and although Howick and Althorp may be far less solitary than the Hermitage, Grey and Spenser retreated equally, in dignity and virtue, from the turbulence of political strife into that respectable, almost reverential, tranquillity, which enabled them, in the infirmity of age, to enjoy the calm retrospection of a good and conscientiously spent life, and to look forward, with equanimity and hope, to an unknown futurity.

During the two presidencies of General Jackson, great activity prevailed in almost every state in the union. Temperance meetings,—meetings of educational societies, and slavery abolition meetings,—the pillage and burning of a Catholic convent in New England states; anti-slavery meetings and riots in New York,—anti-tariff meetings, or nullification, in South Carolina;—war almost of an exterminating character against the aborigines of Florida,—the massacre of an American corps by the Mexicans,—dreadful fires at New York, and in many other towns; the destruction by fire of the United States post office, and of the patent office,—the burning of the village of Roanoke by 300 or 400 Seminoles, the accidental burning of President Jackson's residence the Hermitage—the suspension of cash payments by the banks—the imprisonment of the missionaries who were in Georgia;—treaties with the Indians ceding the territories of the latter east of the Mississippi,—the war in Texas,—and the final discomfiture of the Mexicans in that territory;*—steamboat explosions, and various disastrous losses, marked this period during which, however, the country in other respects advanced in population and prosperity. The cultivation of cotton wool, especially,—improvements in agriculture,—the progress of settlement on the great rivers of the Ohio,—Mississippi, and Missouri, and on the banks of the latter and interior country, were all unprecedented.

Naval construction, improvements in architecture, and many works of great utility were conspicuous. The boundary disputes with England had not, it is true, been adjusted; but treaties of commerce had been, in the

* In April, 1836, General Houston, with a force of 783 Texans, defeated about 1500 Mexicans, commanded by the President General Santa Anna, and took the latter prisoner. The *Texan Americans* lost two killed, twenty-three wounded, six of whom mortally. The Mexicans lost, 630 killed, 208 wounded, 730 prisoners, 600 muskets, 390 sabres, 260 pistols, 12,000 dollars, and several hundred horses were also taken by the Americans. Such is the account published by the latter.

meantime, concluded by the United States with Brazil, Turkey, Mexico, Morocco, and Russia. The King of the Netherlands gave an award in 1831, on the boundary between Maine and New Brunswick. It dissatisfied both parties, and was rejected. In October, 1834, the Cherokees ceded their whole territory east of the Mississippi to the United States, and agreed to retire to Arkansas. About the same time the slaves in the British possessions were emancipated.

James Smithson, of London, left at this time 100,000*l.* sterling for endowing an institution for the diffusion of knowledge in the United States ; and Stephen Girard, a Frenchman by birth, left a large fortune to found a college at Philadelphia.

The administration of General Jackson was vigorous, dignified, and with some allowance for human nature, just and virtuous. It will form a conspicuous part of the history of Anglo-America. There never existed a mind in which dwelt more conscientiously the earnest determination of doing, fearlessly, all that he considered equitable to the whole people. To few rulers will prosperity render more honourable justice.

Mr. Van Buren succeeded to the presidency, and was inaugurated on the 4th of March, 1837. A financial crisis, which created extraordinary excitement, occasioned an extra session of Congress to meet on the 2nd of September of the same year. (The measures adopted with reference to the Bank of the United States, the treasury, and the currency, will be found detailed in the second volume of this work.) The war in Florida still continued. The senate, in the end of September, 1837, ceded, by treaty, 5,000,000 of acres of land, east of the Mississippi, to the United States, for 1,000,000 of dollars, and the Winnebagoes ceded their territory, east of the Mississippi, for 1,500,000 dollars. In January following, the Seminoles were defeated but not crushed in Florida. During the winter of 1838, a most unjustifiable, and most wretchedly organised rebellion broke out in both Upper and Lower Canada. We do not deny that there were many severe causes to provoke this rebellion,—but there were ample constitutional means to obtain a redress of all grievances, without resorting to arms and bloodshed. We must in justice observe, that although many of the most worthless of the united citizens, entered into the spirit of this revolt, the government of the United States, acted in the highest degree, upon terms of good faith with his Majesty's government. The policy of Mr. Van Buren was enlightened, just, and pacific, and his commercial views were sound.

In April, 1838, a convention of 180 delegates met at Augusta, Georgia, for the purpose of promoting a direct trade from the recognised territories of Georgia, Florida, and Alabama, to Europe : a trade which a high tariff of duties had paralysed.

About the same time, 143 bank delegates from eighteen states, assembled at New York, to consider the resumption of specie payments.

The progress of the temperance societies had now become so powerful, that a law was passed by the legislature of Massachusetts, prohibiting the retail of spirits, and its sale in any less quantity than fifteen gallons.

Charlestown, South Carolina, was this year nearly destroyed by fire; and Pennsylvania Hall was destroyed by a mob on account of the anti-slavery lectures delivered within it. The Mormon troubles in the west caused outrages and murders disgraceful to civilisation.

On the meeting of the legislature of Pennsylvania, in consequence of a dispute about the choice of speaker, the people surrounded the Senate House, the senators retired, and the people entered and occupied it, until put down by the troops sent to Harrisburg by the governor; but not until business was interrupted twenty-three days. It would appear that this disturbance arose also from real, or presumed irregularities in the election of members.

In January, 1839, outrages were committed on both sides of the Maine and New Brunswick boundary, and prisoners were taken on both sides. In May, the Seminole deputies agreed, by treaty, to retire below Peace Creek, Florida—but the treaty was disowned by the tribe, and hostilities were resumed, and they killed about eighteen United States citizens. There were also riots in Philadelphia, arising from coloured persons celebrating the anniversary of slave-emanicipation in the West Indies. The whites were in this case the aggressors. It was quelled by the militia, but not until several houses were burnt. There were also riots at Cincinnati, between German volunteer soldiers and the citizens. In the midst of various matters, the president vetoed the tariff bill.

In September, 1839, the Bank of the United States finally suspended all payments, and a great number of other banks followed the example; congress met on the 2nd of December, but, on account of some irregularity, respecting the return of five members, business was not entered upon until the 26th. In January, 1840, the Sub-treasury bill passed. Its object was to enforce the payment of duties and taxes in cash, by a graduated scale, to commence with one-fourth, then by one-half, and then by three-fourths in cash, until the 30th of January, 1843: afterwards, all payments for duties and taxes, to be made in cash.

The Whig Young Man's Convention was formed this year, and met on the 4th of May from every state in the union, to the number of 2000, at Baltimore: the object being to secure the return of General Harrison as president. On the following day, the National Democratic Convention met, with delegates from twenty-one states, to promote means for re-electing Mr. Van Buren.

In the month of February, 1841, the Bank of the United States, or Pennsylvania, declared its most disastrous bankruptcy. On the 4th of March, General Harrison was inaugurated as President of the United States.

President Harrison called an extra session of congress to meet on the 31st of

May, in consequence of the financial and currency state of the country; but the president dies, much lamented, on the 4th of April, and is succeeded by the vice-president, Mr. Tyler, who meets the congress in conformity with General Harrison's proclamation. The Sub-treasury Bill was abolished, and a bill for establishing a fiscal bank vetoed by the president. A bill to distribute the proceeds of the sales of public lands, and a general bankruptcy law, were at the same session passed. The president also vetoed the Fiscal Corporations' Bill. On the 4th of September, Cincinnati was reported to be in a state of anarchy, caused chiefly, as along the Rideau Canal, Canada, and many other places, by mobs of Irish labourers. Washington used the Veto Power twice, Madison four times, Munroe once, Jackson five times, Tyler twice. By all the Veto Power was exercised *fourteen* times.

In October, 1841, an expedition from Texas, under General Mac Loud, against Santa Fé, surrendered at discretion to the Mexican forces, and were sent to Mexico as prisoners. On the following year, the Mexicans invaded Texas with no success. There were very serious riots, in 1842, at Cincinnati, and in consequence of disturbances in Rhode Island, military law had been proclaimed.

In 1842, the vexed question of the Maine boundary was adjusted by treaty. Neither the citizens of the United States, nor the subjects of England, were satisfied as to the mere settlement of the line of boundary; but the arrangement of difficulties, that might have caused an interruption of peace, was considered a great good by all wise men. The Oregon boundary alone remained a question of dispute, and notwithstanding the clamours of the newspapers, and the political use made of it by party, there appeared little doubt that the Oregon dispute would be arranged as amicably as the Maine boundary.

During the following year, no great public event agitated the public mind. Fires, steamboat accidents, hurricanes in Florida, no little violence respecting the Oregon question, and discourses and reports on the tariff duties, were among the subjects that occurred.

The winter of 1844 was distinguished by unusual severity. Steamboat accidents of a terrific character occurred during the year: and especially the disastrous loss of life occasioned by the bursting of a tremendous cannon on board the steamship *Princeton*.*

In the end of March, the general assembly of Rhode Island protested against

* Feb. 28. — A terrible accident occurred on board the United States' steamer *Princeton*, Captain Stockton, during an excursion on the Potomac, a large party of distinguished persons being on board. One of the very large guns, made of wrought iron, under the superintendence of Captain Stockton, on being fired the third time, burst, and the explosion instantly killed Mr. Upshur, secretary of state; Mr. Gilmer, secretary of the navy; Com. Kennon, chief of one of the naval bureaus; Virgil Maxcy, Esq., recently chargé d'affaires to the Hague; the Hon. David Gardiner, of New York, and two or three domestics; besides wounding ten or twelve of the crew. The President of the United States, the other members of the cabinet, and many ladies were on board, all of whom fortunately escaped without injury.

March 1. — The steamers *De Soto* and *Buckeye* ran against each other on the Mississippi river, and the latter almost immediately sunk, by which accident more than sixty persons were drowned.

the right of congress to interfere with the internal affairs of that state. In April, the treaty annexing Texas was signed by President Tyler. Some very disgraceful quarrels occurred on the floor of congress, worthy only of the barbarous, and fatal conflicts which, at one period, occurred in the ecclesiastical *councils* of Europe: when prelates and princes fought with drawn swords. If ever a country should institute a law to suppress duels, and savage-like quarrels, in, or out, of congress, that country is the great Anglo-American Republic. The prevalent exercise of personal violence, such as firing a pistol with the intent to kill, having seriously wounded one person on the floor of the house of representatives as well as the many fatal duels which have within the last few years taken place, show clearly that the life of the most learned and moral legislator has no protection from the barbarian reckless of life.*

The riots which followed at Philadelphia in May, between those styling themselves the native Americans, and the Irish residents, prove conclusively the necessity of increasing the power of the civil authorities, so as to enable them to maintain the public peace. During these riots three Irish Catholic churches, a large seminary, and thirty dwelling-houses were destroyed by fire; fourteen persons were killed, and forty wounded, by fire-arms, before the riot was finally suppressed by the military. These riots were renewed in July, an irregular battle was fought between the military and the rioters, with artillery and musketry. Forty to fifty men were killed. These disturbances were at last put down by the governor, at the head of about 5000 armed men.

The year 1844 was prolific in these and other breaches of the public peace. That fanatic or impostor the Mormon prophet, Joe Smith, and his brother Hiram, who had been arrested and imprisoned by the governor of Illinois, were murdered by a mob of more than 100 men, who, disguised, broke into the gaol in which they were confined.

Outrages broke out also in the county of Rensselaer, New York, on the part of the tenantry who refused to pay any rent, and who treated with violence the officers of the law.

Democratic meetings and meetings of the Whig party were also held. A Whig convention at Baltimore, at which 50,000 persons are said to have been present, nominated Mr. Henry Clay for President of the United States. At a Whig mass meeting at Boston, Mr. Mellish presided, and 25,000 persons are said to have assembled. A rule of the house of representatives prohibiting the reception of abolition petitions in that house, was, on the motion of John Quincy Adams, rescinded on the 3rd of December, 1844, by 108 for, to 88 against the motion.

A circumstance occurred towards the close of the year which, at the time, appeared to have involved a question seriously affecting state sovereignty. The Honourable Samuel Hoar was sent from Massachusetts to South Carolina, in

* Congress has since passed an effective law against duelling.

order to obtain the liberation of coloured citizens of Massachusetts who were imprisoned at Charlestown. On his arrival, the legislature passed resolutions under which the governor expelled Mr. Hoar the same day from the state of South Carolina. This, presumed unconstitutional, insult to Massachusetts appears to have been passed over without any grave consequence. Disturbances of a serious nature occurred during the year in the state of New York. The governor was under the necessity of proclaiming the state in a state of insurrection. Atrocious outrages were also committed in Illinois against the Mormons.*

The new republic of Texas was, by a resolution of congress, in the month of January, and in terms of the treaty made by the president with the governor of Texas, annexed as a state to the Anglo-American confederation. A treaty with China was also ratified, and on the 4th of March, 1845, President Polk was inaugurated. A disturbance of the amicable relations between England and America appeared, almost, inevitable, from the unwise character of his message, and warlike speeches in congress. In the British parliament, the obnoxious parts of Mr. Polk's message were gravely, and sensibly, discussed by the leaders of both parties. It was well known that the whole British nation denounced war. It became well understood that the whole, or part, of Oregon, constituted a miserable cause, of little value, for which to wage a war,—a war which must be attended with the most afflicting and barbarous consequences to the British empire, and as certainly to America,—a war that would have been disgraceful to, that would more than any other retard, civilisation. Yet had President Polk proceeded, even indemnified by congress, to take forcible possession of Oregon, war would have been inevitable: not for Oregon, but by England, on the great principle of national rights,—on the principle of maintaining that dignity, which has never been abandoned, except in the melancholy degradation, and certain decline of nations.

Happily for mankind,—fortunately for the magnanimity of civilisation, the intelligent wisdom of the citizens of the United States; the temperate unanimity of the British people,—and the cordiality of opinion with respect to the boundary question on the part of the late as well as of the present ministry, caused the adoption of those measures by which all disputes respecting Oregon have been adjusted.

This vexed question being now settled, it appears to be the last, about which the Anglo-Saxon race, whether in Europe or in America could have, had the least cause of difference. Let the mutual warfare of obnoxious tariffs and navigation laws cease, and the reciprocal interests and happiness, of the United Kingdom and the United States, may become so thoroughly blended, as to make the people of each, almost, feel that they are one nation as, well as one people.

* Hoar blundered. He should have had recourse to the United States Courts; instead of it he wrote to the governor. But the American constitution does not recognise diplomacy between the states.

NOTES TO BOOK II.

NOTE A.

THE AMERICAN SYSTEM, OR THE MISNOMER CALLED "PROTECTION."

THE delusion created by alluring terms, or expressions, has, at all times, been remarkable; and especially so, when those terms of seduction do not apply to the true meaning of what they insinuate, and what superficial minds believe, on the faith of those who propagate those terms. For instance, the term *protection*, insinuating the encouragement and support of manufacturing industry, has been accepted by the superficial, as if such protection caused the growth of manufactures, and enabled the whole people to obtain all the articles which they required independently of any foreign country, and that such independence was the most glorious and happy condition of a nation.

The whole people, however, do not, until well instructed on the subject, as has been the case in England, by the report of the Import Duties Committee, in 1840, and by the speeches and publication of the Anti Corn Law League, and by speeches in parliament, enter gravely into a calculation as to the portion of their whole productive labour, that is taken away from them by this proud term PROTECTION. In England, they have been generally so well instructed as to its meaning, as to understand that the true interpretation of *protection* means, that an Essex, or Kent, or any other farmer, should receive, from the bread-eating people, when wheat is ground into flour, and made into bread, as much in silver or halfpence, for two loaves, as the people would, without the *thing called protection*, buy three loaves for. It is true, that notwithstanding the *thing protection*, the farmer does not always succeed, and the man who manufactured the *thing called protection*, has also been disappointed; that is, the members of the house of landlords (called the commons), or of the house of lords;—that is, as one of those sages declared, they have not succeeded at all times by the agency of *protection*, to have the means of giving marriage portions to their daughters. In fact, they depended upon the misnomer *protection*, and not upon themselves,—not upon thrift, industry, and making the soil yield three quarters of wheat, where, by *protection*, only one or two grow.

In the United States of America, following the bad example, which is usually the case with children, who witness evil conduct at their parental fireside, the people have been not only allured into the adoption of the misnomer *protection*; but the *orators* have given it a still more SEDUCTIVE misnomer, they call it THE AMERICAN SYSTEM. That is a system that will make her produce every thing, without buying any thing from any other nation in the world. The *orators* only reveal half of what the AMERICAN SYSTEM would effect: they do not tell the wheat and

Indian corn, and cotton, and tobacco growers, of the western and southern states, that "*it is true, gentlemen, farmers, and planters of Virginia, Maryland, the Carolinas, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, and of all the fertile states from Lakes Erie and Michigan, west of the Alleghany, and south to Mexico, there is one condition, however, that you may as well comprehend, that is if we do not buy from the other nations, they cannot buy from us. But then we can buy and sell among ourselves. Massachusetts can buy raw cotton in the south, and the south can buy calico in Massachusetts.*" We believe, however, that the agriculturists west of the Alleghanies, and south of the Potomac, will not consent to a sumptuary law, which will limit their markets to the manufacturing states.

We have, with considerable care and industry, read the memorials of the advocates, real or pretended, of "*THE AMERICAN SYSTEM*," as well as the speeches of orators; and, notwithstanding the success of the alluring term *AMERICAN SYSTEM*, we find the soundest principles advanced at different periods. Benjamin Franklin's maxim of international trade was—"I would have the trade of nations as free as between one county in England and another; the counties do not injure one another, neither would the nations." The following resolutions, framed at Boston, are highly worthy at this time of being recorded. We have received them in January, 1847; and they contrast strangely with a late speech delivered by Mr. Webster at Philadelphia.

Boston, Oct. 3, 1820.

New Tariff.—Yesterday an adjourned meeting, on the subject of the proposed tariff, was held at Faneuil Hall; Honourable William Gray, chairman, and William Foster, Esq., secretary.

Resolved, That we have regarded with pleasure the establishment and success of manufactures among us, and consider their growth, when natural and spontaneous, *and not the effect of a system of bounties and protection*, as an evidence of general wealth and prosperity.

Resolved, That relying on the *ingenuity, enterprise, and skill of our fellow-citizens*, we believe that all manufactures adapted to our character and circumstances will be introduced and extended as soon, and as far, as will promote the public interests, without any further protection than they now receive.

Resolved, That no objection ought ever to be made to any amount of taxes equally apportioned, and imposed for the purpose of raising revenue necessary for the support of government; but that *taxes imposed on the people for the sole benefit of any one class of men are equally inconsistent with the principles of our constitution and with sound policy.*

Resolved, That the supposition that, until the proposed tariff, or some similar measure, be adopted, we are, and shall be, dependent on foreigners for the means of subsistence and defence, is, in our opinion, altogether *fallacious and fanciful, and derogatory to the character of the nation.*

Resolved, That the *high bounties* on such domestic manufacturers as are principally benefited by that tariff, *favour great capitalists rather than personal industry or the owners of small capital, and that therefore, we do not perceive its tendency to promote national industry.*

Resolved, That we are equally incapable of discovering its beneficial effects on agriculture, since the obvious consequence of its adoption would be, *that the farmer must give more than he now does for all he buys, and receives less for all he sells.*

Resolved, *That the imposition of duties* which are enormous, and deemed by a large portion of the people to be unequal and unjust, is dangerous, as it encourages the practice of smuggling.

Resolved, That, in our opinion, the proposed tariff, and the principles upon which it is avowedly founded, would, if adopted, have a tendency, however different may be the motives of those who recommend them, to *diminish the industry, impede the prosperity, and corrupt the morals of the people.*

James T. Austin, Esq., and the *Hon. Daniel Webster* addressed their fellow-citizens in favour of the *report and the resolves*, in speeches, which were distinguished for closeness of argument, variety of illustration, and abundance of fact.

The report was then accepted, and the resolves recommended by the committee *unanimously* passed.

A vote of thanks to the Hon. Mr. Otis, of the senate, and to those members from this state in the house of representatives of the United States who oppose the new tariff, was unanimously agreed to.

The names of the committee were:—William Gray; James Perkins; John Dorr; Nathaniel Goddard; Benjamin Rich; Israel Thorndike, jun.; William Shimmis; Thomas W. Ward; William Harris; George Hallet; Joseph Knapp; Winslow Lewis; John Cotton; *Daniel Webster*; Nathan Appleton; Abbott Lawrence; Jos. Sewall; Jonathan Phillips; Lot Wheelwright; Caleb Loring; Samuel A. Welles; George Bond; S. P. Gardner; Isaac Winslow; Thomas Wigglesworth; John Parker; William Sturges.

The following are extracts from Mr. Webster's most able and fearless speech on this occasion, at Faneuille Hall:—

MR. WEBSTER said,—“He felt an unfeigned embarrassment in addressing the meeting on a subject which so many members of it understood much better than himself.

“It was, in the first place, necessary that he should repel any suggestion of a feeling unfriendly to American manufactures. He believed there was no ground for supposing that such a feeling existed in any part of the community—it certainly did not exist with him. He thought it, therefore, quite unjustifiable, that those who could not support the proposed tariff, should be charged with hostility to domestic industry. There was power in names, and those who pressed the tariff on congress and on the country, had represented it as immediately, and almost exclusively, connected with domestic industry and national independence. In his opinion, no measure could prove more injurious to the industry of the country, and nothing was more fanciful than the opinion that national independence rendered such a measure necessary. He certainly thought it might be doubted whether congress would not be acting somewhat against the spirit and intention of the constitution, in exercising a power to control essentially the pursuits and occupations of individuals in their private concerns—a power to force great and sudden changes, both of occupation and property upon individuals, not as incidental to the exercise of any other power, but as a substantive and direct power. If such changes were wrought incidentally only, and were the necessary consequence of such imposts as congress, for the leading purpose of revenue, should enact, then they could not be complained of. But he doubted whether congress fairly possessed the power of turning the incident into the principal.

“But, admitting the right of congressional legislation over these subjects, and for these purposes, to be quite clear, the inquiry was, is it expedient to increase the duties on imposts to the extent proposed in this bill? The principle of the measure he understood to be, that we should encourage the manufactures proposed most to be benefited by the bill, principally those of woollen and cotton cloths, by prohibitory duties. That restrictions, such as we have never before imposed, shall be laid on commerce by way of bounty on particular manufactures. For his own part, he had supposed that restrictions on trade and commerce, in order to benefit particular classes of manufactures were now very generally understood to be mischievous and inconsistent with just notions of political economy. They were of two sorts, such as arise from treaty stipulations between nations

and such as each nation may create for itself by its duties on importations. The understanding between England and Portugal, relative to the importations of the wines of Portugal into England, was an instance of the first sort—the prohibition of French silks into England an instance of the latter.

“Both these and all other modes of giving great preferences to some occupations and some modes of investing capital over others, he believed had almost universally proved detrimental. They not only restrain private enterprise, but often exceedingly embarrass the operations of government. In the instance above-mentioned, the English government at this moment experiences the bad policy of such measures. Notwithstanding the general peace of Europe, the commerce between England and France is understood to be almost a nullity. Why? because England cannot agree to receive on fair terms, and in exchange for her commodities, such principal articles as France produces for exportation, viz., silks and wine. And why cannot she agree to receive these from France? Because, as to wine there is the old treaty with Portugal; and as to silks, the manufacture of that article has been unnaturally forced by high bounties at home, and if those bounties should now be withdrawn, some thousands of persons would be thrown out of employment. So that the particular agreement with Portugal, and a concern for the silk manufacturers of Coventry, completely tied up the hands of government on subjects supposed to be of the highest national importance. To individuals, this policy is as injurious as it is to government. A system of artificial government protection leads the people to too much reliance on government; if left to their own choice of pursuits, they depend on their own skill and their own industry. But if government essentially affects their occupations by its systems of bounties and preferences, it is natural, when in distress, that they should call on government for relief. Hence a perpetual contest carried on between the different interests of society. He could hardly conceive of any thing worse than a policy which should place the great interests of this country in hostility to one another—a policy which should keep them in constant conflict, and bring them every year to fight their battles in the committee rooms of the house of representatives at Washington.*

*“To leave men to their own discretion—to conduct their own concerns by their own skill and prudence, and to employ their capital and their labour in such occupations as they themselves found most expedient, has been found the wisest, as it is the simplest, course of political legislation. As there is an order in the natural world which holds all things in place—as the air we breathe is wisely combined and compounded for our use by the course of nature—so there is a principle of regulation, a sort of *vis medicatrix nature*, in the social world. Excess corrects itself. If there be too much commerce it will be diminished; if there be too few manufactures they will be increased, with but ordinary care and protection. For his part, he believed that, however derided, the principle of leaving such things very much to their own course in a country like ours, was the only true policy—and that we could no more improve the order, and habit, and composition of society by an artificial balancing of trades and occupations, than we could improve the natural atmosphere by means of the condensers and rarifiers of the chemists.*

“In truth, every man in the community, not immediately benefited by the new duties, would suffer a double loss. In the first place, by shutting out the former commodity, the price of the domestic manufacture would be raised. The consumer, therefore, must pay more for it. And, in so much as government will have lost the duty on the imported article, a tax equal to that duty must be paid to government. The real amount, then, of this bounty on a given article will be precisely the amount of the present duty added to the amount of the proposed duty; at least, so it appeared to him (Mr. W.), and, if any calculation could make it otherwise, he would be glad to see it. Again: it is proposed to raise the duties on salt and brown sugar; these are articles of very general consump-

* Except by smuggling, until we admitted French silks in 1828, and almost every other article produced by France at moderate revenue duties. The consequence has been, that the exports of British manufactures to France arose from being a nullity in 1826, to about 600,000*l.* in 1829, and to more than 3,000,000*l.* in 1846.

tion, and the duty on them is raised probably with a view of supplying, in some degree the loss to the treasury arising from excluding other articles. This is the tax, then, imposed to enable the treasury, in some measure, to bear its other losses. In other words, sugar and salt are taxed, because cotton and woollen cloths are to be taxed so high as to prevent their importation ;—there is a tax on *food* in order that there may be a tax on *clothing*.

“ And, after all, how few of all the members of society are to be benefited by this system, so artificially and elaborately constructed. Certainly not all manufacturers nor mechanics, but a particular class only.

“ All those manufacturers who have now the home market in their possession, and export more or less of their wares—the manufacturers, for instance, of shoes, nails, cabinet furniture, carriages, &c.—all these are injured, not benefited. They feel the burden without partaking the profit. *We might add to these at once, all the numerous classes whose occupations are connected, directly or indirectly, with navigation and commerce.* It is said, to lull the alarms in the treasury, that the deficit of five millions in the revenue may be made up by an *excise on domestic manufactures, when the foreign article should be excluded.* But on what manufactures? On cotton and woollen alone, and principally? Certainly not. On others, as much or more, than on them. On carriages, for example, among the first. *This is a tax which, like many others, always diminishes the demand for the article.* It takes away, then, at once, the employment of the artist who works in this line. He is a manufacturer, therefore, not benefited, but likely in the end to be ruined.

“ And yet he (Mr. W.) had understood that, in making out the new census, *coach-makers, and all other handicraftsmen or tradesmen*, were denominated *manufacturers*, and this would show a great number of manufacturers in the census, appearing to be benefited by protecting manufacturers. The case he had alluded to might suffice for an instance and example of many; and, when the whole should be investigated, it would be found that the sorts of manufacturers to be benefited by the proposed measures were very few. An appeal had been made to the patriotic feelings of the nation.

“ *It had been said, we are not independent so long as we receive these commodities from other nations.* He could not see the force of this appeal. He did not perceive how the exchange of commodities between nations, when mutually and equally advantageous, rendered one dependent on the other in any manner derogatory to its interest or dignity. *A dependence of this sort exists everywhere among individuals as well as nations. Indeed, the whole fabric of civilisation, all the improvements which distinguished cultivated society from savage life, rest on a dependence of this kind.* The reasoning assumes that, in war, no means of defence or annoyance can be probably obtained, or not without great difficulty, except from our own materials or manufactures. He doubted whether there was much ground for that assumption. Nations had hitherto obtained military means in the midst of war from commerce. But, at any rate, as it was acknowledged on all hands that the country possessed the *capacity* of supplying itself whenever it saw fit to make the sacrifice—and he did not see why the necessity of making it should be anticipated—why should we now change our daily habits and occupations with great loss and inconvenience, merely because it is possible some change may hereafter become necessary? *We should act equally wisely, he thought, if we were to decide that, although we are quite well, and with very good appetites, yet, as it was possible we might one day be sick, we would, therefore now sell all our food and lay up physic.*

“ There was, however, (Mr. W. observed,) one part of our national defence, which the advocates of the new measures appeared to have quite overlooked or forgotten. He meant the navy. *If the commerce of the country should cease, the navy must cease with it.* This he thought too plain to be questioned. A country with a powerful navy, and little or no commerce, would be an anomaly in history. *The great object aimed at seemed to be, either to annihilate or greatly diminish our foreign trade. Where, then, are our seamen to come from for the navy?* By reference to the amount of American tonnage in 1810, the year when its amount was greatest, it will be seen that there were

employed in the foreign trade, 984,000 tons, in the coasting trade, 371,000 tons. The proportion of seamen to tonnage, is, of course, greater in the larger vessels, so that probably *three-fourths of the seamen of the United States* were employed in the foreign trade. The coasting trade itself would be immediately diminished by the curtailment of the foreign trade, and if it should afterward revive, and be even increased and extended, there was no reason to suppose that it would supply seamen in sufficient numbers for the navy.

"*Let those, then, who would abridge commerce, on the ground of a more independent provision for national defence, declare whether they esteem a navy to be among our means of defence. If they do not, their argument may be consistent; if they do it is a fallacy.*" Mr. W. said he would add a few observations upon a more general view of the subject. "We must regard the proposed measures either as intended to be temporary, or as intended to be permanent. If they were to be but temporary the manufacturers would be ruined by their repeal. We must look upon the proposed duties, therefore, as intended to be permanent; if not permanent at the same rates, yet permanent at such rates as shall preserve the system of manufacturing for ourselves. We are bound, therefore, to regard future consequences and the state of things which may ultimately arise, if this system should be adopted and established. *It was the part of true wisdom to look to the end.*

"For his part he did not consider a great manufacturing population a benefit to be purchased with so much cost. He thought there were great evils in it. When it shall come, naturally, and in the progress of things, we must meet it. But, why hasten it? What we see of it elsewhere did not recommend it to us. *The great object of good governments was individual happiness, and this, to be general, required something like an equality in condition.*

"And how would it be in commerce? suppose it were in the freighting business? A commercial friend had furnished him with a statement which would show the result: a ship fit for that service may cost 15,000 dollars. She will require, in her immediate service on board, fifteen hands. *Then full occupation for one man is found here on a capital of 1000 dollars. But in the manufacturing establishment, 2000 dollars are required.* In the first case, however, it is not the immediate employment of the navigators that is demanded and paid. He who furnished the timber, he who built the ship, all the classes connected with commerce and navigation, are employed and paid. Or suppose we look to the West India trade, as we have sometimes enjoyed it. That is a trade favourable to small capitals and to personal labour. It is a trade of short voyage and quick return; a trade which transports gross commodities both ways, and requires, therefore, many vessels, and those small.

"Hence, we have seen respectable towns growing up and kept in activity, and proceeding to wealth, almost by that trade alone.

"He believed, upon the whole, that all reasonable encouragement had been already given to manufactures, and especially to the manufactures of cloth. He had the pleasure of seeing gentlemen present, not from one only, but from several of the factories in this neighbourhood. If their business were ruinous, as some of the manufacturers had elsewhere pretended, he hoped they would state it. He would be quite willing to leave it to those gentlemen themselves to say whether with the present protection the best conducted manufacturing establishments did not yield as fair profits on capital as other branches of business! He exceedingly doubted whether they would be willing to come into an average, and to divide their present profits with the agriculturists and the merchants. He believed, indeed, that the persons connected with the establishments to which he had alluded had not petitioned congress for new duties. He believed that others would have been wise to have followed the same course. That which is most to be desired on these subjects is steadiness and permanency. He hoped the present duties would stand without increase or diminution; that congress would adhere to what it had already established, and that both the government and the country would resist all attempts to make new, frequent, and great changes in the value of property, in the occupations and pursuits of men, and in the means of living."

The foregoing opinions are so thoroughly sound and true, that we have too high an opinion of the judgment of Mr. Webster, to believe they will be found among the number of those "WHICH, WHEN DYING, HE WOULD WISH TO BLOT."

NOTE B.

POLITICAL INTERCOURSE OF THE UNITED STATES WITH FOREIGN NATIONS.

THE wisdom and judgment of General Washington is beautifully exemplified in the following extracts from his last affectionate parental address to the nation.

"Observe good faith and justice towards all nations; cultivate peace and harmony with all. Religion and morality enjoin this conduct; and can it be that good policy does not equally enjoin it? It will be worthy of a free, enlightened, and (at no distant period) a great nation, to give to mankind the magnanimous and novel example of a people always guided by an exalted justice and benevolence.

"In the execution of such a plan, nothing is more essential than that *permanent, inveterate antipathies against particular nations, and passionate attachments for others*, should be excluded, and that, in place of them, *just and amicable feelings towards all should be cultivated*.

"The great rule of conduct for us in regard to foreign nations, is extending our *commercial relations*, to have with them as *little political connexion* as possible. So far as we have already formed engagements, let them be fulfilled with perfect good faith. Here let us stop.

"Europe has a set of primary interests, which to us have none, or a very remote relation. Hence she must be engaged in frequent controversies, the causes of which are essentially foreign to our concerns. Hence, therefore, it must be unwise in us to implicate ourselves, by artificial ties in the ordinary vicissitudes of her politics, or the ordinary combinations and collisions of her friendships or enmities.

"Our detached and distant situation invites and enables us to pursue a different course. If we remain one people, under an efficient government, the period is not far off, when we may defy material injury from external annoyance; when we may take such an attitude as will cause the neutrality, we may at the time resolve upon, to be scrupulously respected; when belligerent nations, under the impossibility of making acquisitions upon us, will not lightly hazard the giving us provocation; when we may choose peace or war, as our interest, guided by justice shall counsel.

"Why forego the advantages of so peculiar a situation? Why quit our own, to stand upon foreign ground? Why, by interweaving our destiny with that of any other part of Europe, entangle our peace and prosperity in the toils of European ambition, rivalry, interest, humour, or caprice?

"It is our true policy to *steer clear of permanent alliances with any portion of the foreign world*; so far, I mean, as we are now at liberty to do it; for let me not be understood as capable of patronising infidelity to existing engagements. I hold the maxim no less applicable to public than to private affairs, that honesty is the best policy. I repeat it, therefore, let those engagements be observed in their genuine sense. But, in my opinion, it is unnecessary, and would be unwise to extend them.

"Taking care always to keep ourselves, by suitable establishments, in a respectable defensive posture, we may safely trust to temporary alliances for extraordinary emergencies.

"Harmony, and a liberal intercourse with all nations, are recommended by policy, humanity, and interest. But even our commercial policy should hold an equal and impartial hand; *neither seeking nor granting exclusive favours or preferences; consulting the natural course of things; diffusing and diversifying, by gentle means, the streams of commerce, but forcing nothing*; establishing with the powers so disposed, in order to give trade a stable course, to define the rights of merchants, and to enable the government to support them, conventional rules of intercourse,—the best that present circumstances

and mutual opinion will permit; but temporary, and liable to be, from time to time, abandoned, or varied, as experience and circumstances shall dictate; *constantly keeping in view, that it is folly in one nation to look for disinterested favours from another; that it must pay with a portion of its independence for whatever it may accept under that character; that by such acceptance, it may place itself in the condition of having given equivalents for nominal favours, and yet of being reproached with ingratitude for not giving more. There can be no greater error than to expect or calculate upon real favours from nation to nation. It is an illusion which experience must cure, which a just pride ought to discard.*"

(See the whole of this address in the supplement to this volume.)

From the day George Washington gave the instruction contained in this celebrated address to his fellow-citizens, all but demagogues and unprincipled disturbers of the laws, have religiously and politically regarded it as a testament, which hath bequeathed to them rules of conduct, to carry them through peace and strife,—through adversity and prosperity.

During the long war in which England was so expensively engaged against France,—and for some time against all Europe, America remained, according to her constitutional principles, neutral, but always insisting on indemnity for losses suffered by her citizens, from the belligerent powers.

BOOK III.

EMPIRE OF BRAZIL.

CHAPTER I.

HISTORICAL SKETCH UNTIL THE FORMATION OF THE DUTCH SETTLEMENTS.

WE have in the first book of this volume, briefly sketched the discovery, settlement, and history of Brazil until its evacuation by the Dutch in 1661.

There are, however, circumstances bearing upon the colonisation by, and colonial policy of, Portugal, differing so far from the system of both as persevered in by Spain, which deserve some observations. Brazil was at an early period made a penal colony. In order to turn to some account those tried, for crimes or heresy, by the civil tribunals, and by the Inquisition, they were, as a commutation of the punishment of death, sentenced to transportation and hard labour in Brazil.

This system of colonisation could not be favourable to the moral character of new settlements. The aborigines soon lost all awe and respect for them. The convict settlers were not only rendered desperate by their situation, but from having been greatly hardened by crime, they led the most turbulent, dissolute lives. They soon exasperated the natives; who were at first kindly disposed towards the convicts and other Portuguese; but the unjust acts of the latter were soon resisted by the aborigines, who killed several of the convicts. The Portuguese then commenced a series of atrocities not surpassed in cruelty by the outrages of the Spaniards in America; and they almost invariably massacred the old men and children in the villages, and reduced the strong adults to slaves.*

* The first settler in Bahia was Diogo Alvarez, whose history, as detailed by Mr. Southey, is romantically interesting.

"He was a native of Viana, young, and of noble family, who, with that spirit of enterprise which was then common among his countrymen, embarked to seek his fortune in strange countries. He was wrecked upon the shoals on the north of the bar of Bahia. Part of the crew were lost, others escaped that mode of death to suffer one more dreadful; the natives seized and ate them. Diogo saw that there was no other possible chance of saving his life, than by making himself as useful as possible to these cannibals. He therefore exerted himself in recovering things from the wreck, and by such exertions succeeded in conciliating their favour. Among other things, he was fortunate enough to get on shore some barrels of powder and a musket, which he put in order at his first leisure, after his masters were returned to their village: and one day, when the opportunity was favourable, brought down a bird before them. The women and children shouted

Brazil was afterwards divided into hereditary captaincies (*capitanias*), granted by King John to grandees who had rendered services to the crown. They were bound either to go to Brazil in person, or to send colonists out to people that country. They were invested with uncontrolled authority and jurisdiction, both civil and criminal, over their respective captaincies. Martin Affonso de Sousa received, in 1531, a grant of the region contiguous to St. Vincente,* extending about fifty leagues along the coast. Pedro Lopez de Sousa, his brother, had also fifty leagues of land granted him in two allotments: one part, St. Amaro, to the north of St. Vincente; the other, Itamarica, was situated near Pernambuco. Joam de Barros, the historian, obtained the captaincy of Maranhão. Pernambuco became the captaincy of Duarte Coelho Pereira. The region near the southern Paraíba was granted to Pedro de Goes. The territory between the River St. Francisco and Bahia was bestowed on Francisco Pereira Coutinho. The capitania dos Ilheos, running north and south from the Rio dos Ilheos, was granted to George Figueiredo Correa. Porto Seguro, with its region of sea-coast, formed a capitania of the same name, and was granted to Pedro Campo Tourinha. Espiritu Santo was formed into a captaincy, and given to Vasco Fernandez Coutinho.

Brazil was, therefore, colonised under a kind of feudal system. Few settlements were founded by the crown; the governors or proprietors made war or peace with the Brazilian tribes, issued laws, and imposed taxes. But an authority so absolute was despotically exercised, and finally occasioned the withdrawal by the crown of the powers invested in these feudal lords: leaving them, however, in possession of their grants of lands. A governor-general was appointed. Thome de Souza, a fidalgo, was the first governor-general. He arrived in the *Bahia de todos os Santos* (Bay of All Saints), in April, 1549, accompanied by the first Jesuits who had ever landed in America. Father Manoel de Nobrega, the principal Jesuit, was a man of deservedly high character.†

Caramuru! Caramuru! which signified a man of fire, and they cried out that he would destroy them; but he told the men, whose astonishment had less of fear mingled with it, that he would go with them to war, and kill their enemies. Caramuru was the name which from thenceforward he was known by. They marched against the Tapuyas; the fame of this dreadful engine went before them, and the Tapuyas fled. From a slave Caramuru became a sovereign; the chiefs of the savages thought themselves happy, if he would accept their daughters to be his wives. He fixed his abode upon the spot where Villa Velha was afterwards erected, and soon saw as numerous a progeny as an old patriarch's rising round him. The best families in Bahia trace their origin to him.

"At length a French vessel came into this bay, and Diogo resolved to take that opportunity of once more seeing his native country. He loaded her with Brazil-wood, and sailed for France, where he was received with honours, but not allowed to proceed to Portugal. He returned to Bahia, which he fortified."

* "Martin Affonso de Sousa and his brother fitted out a considerable armament, and went to form their settlement in person. He began to survey the coast somewhere about Rio de Janeiro, to which he gave that name, because he discovered it on the 1st of January; and he proceeded south as far as the Plata, naming the places which he surveyed upon the way, according to the days on which the several discoveries were made."—*Southey's History of Brazil*, vol. i. p. 41.

† Nobrega was the contemporary of St. Francis Xavier and his rival in disinterested exertions for the good of his fellow-creatures. He has been termed the Apostle of Brazil. He was of a noble Portuguese family, but, disappointed of some collegiate honour, to which he thought he

In 1548, the Inquisition robbed the rich Jews of their property in Portugal, and banished them to Brazil. Being known, as honourable in their dealings, these Jews obtained, in Brazil and in Portugal, advances of money from the merchants with whom they had formerly transacted business. They imported sugar-canes from the island of Madeira, and formed sugar plantations in Brazil. Sugar had been used only in medicine before that time, but it soon became an article of luxury; and, the demand increasing rapidly for it, the colonists were enabled to extend plantations.

De Souza, on arriving at Bahia, found old Caramuru peaceably established in that place. He was of great service to De Souza in maintaining a friendly understanding between the Portuguese and the Indians. Within four or five months after the arrival of the governor-general, about one hundred houses were built, and the erection of a cathedral was begun, batteries were formed, and a mud wall was raised around the town. All necessary supplies were imported during the following two years from Portugal. Several young women, orphans of noble families, were also sent out by the queen to be given in marriage to the military and civil officers, with doweries in cattle, brood-mares, and negroes, from the crown estates. This was the first royal settlement. De Souza, by building St. Salvador, gave a central capital to Brazil, but the honour of extending its settlements is nearly altogether due to the Jesuits. They dispersed themselves among the Indians, and guided by peace and charity, conciliated their confidence and attachment. The obstacles which they had to encounter were formidable, and, to any other class of missionaries, probably insurmountable. They began by instructing the children of the aborigines, taught them the Portuguese language, and at the same time the Jesuits acquired the language of those, to whom they conveyed the rudiments of morality and civilisation.* The task of eradicating the cannibal propensities of the natives is affirmed to have been the chief difficulty of the Jesuits. They succeeded in making them sober, in making each man content with one wife, and in healing feuds; but feasting on the flesh of their enemies was for a long period not overcome. The Jesuits, in these praiseworthy efforts, were

had a better claim than the successful candidate, he had renounced the world in a fit of disgust, little aware that that step would lead to his acting a more prominent and important part than, with all his talents and fair prospects, would otherwise have been within his reach.

* Nobrega had a school near the city, where he instructed the native children, the orphans from Portugal, and the mestizos or mixed breed, here called Mamalucos. Reading, writing, and arithmetic were taught them; they were trained to assist at mass, and to sing the church service, and were frequently led in procession through the town. This had a great effect, for the natives were passionately fond of music—so passionately, that Nobrega began to hope the fable of Orpheus was a type of his mission, and that by songs he was to convert the pagans of Brazil. He usually took with him four or five of these little choristers on his preaching expeditions. When they approached an inhabited place, one carried the crucifix before them, and they entered singing the litany. The savages, like snakes, were won by the voice of the charmer; they received him joyfully, and when he departed with the same ceremony, the children followed the music. He set the catechism, creed, and ordinary prayers to sol, fa: and the pleasure of learning to sing was such a temptation, that the little Tupis sometimes ran away from their parents to put themselves under the care of the Jesuits.”—*Southey's History of Brazil*, vol. i. p. 267.

opposed by the low priests, who had previously settled in the country. The priests exacted fees for every clerical act: the Jesuit missionaries performed all the ceremonies of religion gratuitously. The priests had maintained that it was lawful to enslave the Indians as beasts. They trafficked in human beings. They hated the Jesuits, whose mission was incessantly and laboriously exercised in the good work of instructing and humanising the aborigines.

The first Brazilian bishop was appointed in 1552. In 1557, Thome de Souza, having been governor-general for four years, was recalled at his own request. D. Duarte da Costa, his successor, was accompanied by the celebrated Anchieta and six other Jesuits, who soon afterwards established a college in the plains of Piratininga, or St. Paul's, a delectable situation about ten leagues from the sea. Disputes arose between the bishop and Da Costa. The former embarked for Portugal in order to state his grievances to the king, but was shipwrecked on the coast, and, with about a hundred Europeans, murdered by the Cahetes. The Portuguese avenged these murders with atrocious severity. The Cahetes and their posterity were condemned to perpetual slavery; they were hunted and slaughtered until nearly exterminated.

Da Costa was succeeded, in 1558, by the celebrated Mem da Sa. He endeavoured to reclaim the Indians from their barbarous propensities, and ordered that all who had been wrongfully enslaved should be set free. One rich colonist refused to comply with this order; his house was levelled to the ground by the governor's command. Mem da Sa resolved, also, that the edict prohibiting the cannibal feasts of the natives would be summarily enforced.

"Three friendly Indians were seized, when fishing, by their enemies, carried off, and devoured. The governor sent to the offending tribe, commanding them to give up the criminals that they might be put to death. The chiefs would have consented, but the persons implicated were powerful; the adjoining clans made a common cause with them; two hundred hordes who dwelt upon the banks of the Paraguazu, united in defence of their favourite custom; and the answer returned was, that if the governor wanted the offenders, he must come and take them. This, in despite of the opposition made by the settlers, he resolved to do. The allied natives took the field with them, with a Jesuit at their head, and a cross for their standard. They found the enemy well posted, and in considerable strength, but they put them to flight. After the battle, it was discovered that an arm had been cut off from one of the dead: as this was evidently taken by one of the allies to eat in secret, proclamation was made that the arm must be laid by the body before the army took food or rested after the battle. The next morning the enemy were pursued, and suffered a second and more severe defeat, after which they delivered up the criminals, and petitioned to be received as allies upon the same terms as the other tribes."*

* "Southey's Brazil."

It was during the government of Mem da Sa that the expedition was made to Brazil under Villegagnon, related in the first book.

Mem da Sa, soon after the expulsion of the French, was alarmed by a new foe. The Aymores, or Botucodoes, the most cowardly, yet most dangerous,* of all the Brazilian tribes, invaded Ilheos and Porto Seguro, and threatened San Salvador. With the assistance of his Indian allies Mem da Sa repulsed them. Other tribes molested the settlers; and, were it not for the influence of the Jesuits over the aborigines, the Portuguese colonists would have been exterminated.

Mem da Sa ruled in Brazil for a much longer period than his predecessor. D. Luiz de Vasconcellos was appointed to succeed him, accompanied by a number of Jesuits, under F. Ignacio de Azevedo. The fleet in which they sailed, having separated, was attacked by several French and English ships. Luiz de Vasconcellos fell in an action with the latter off Terceira; the Jesuits were all massacred by a French pirate, excepting one, who escaped in a lay habit. Nobrega, prematurely reduced to old age by incessant fatigue, closed a life of self-denial and heroic virtue at the age of fifty-three. Mem da Sa lived to receive the new governor, Luiz de Almeida, and died almost immediately afterwards, after a vigilant and prosperous administration of fourteen years.

The colonisation of Brazil had been so rapid, that Luiz de Brito divided the country into two governments. All the districts south of Porto Seguro were included in the department, of which Rio de Janeiro was created the capital. The separate governments were, however, found extremely inconvenient, and were re-united in 1578, under the administration of D. Diogo Lourenzo da Veiga, the fatal year in which Sebastian, King of Portugal, was cut off, with the chief of his nobility, by the Moors. Brazil, in consequence, came with Portugal under the dominion of Spain for about sixty years. The offer of Philip II. of all the Brazilian colonies, with absolute sovereignty, with the title of king, to the Duke of Braganza, on condition of his relinquishing his claim to the Portuguese crown, was declined.

* "The mode of warfare among them was as savage as their habits of life; they had no chief or leader; they never went in large companies; they never stood up against an enemy face to face, but lay in wait like wild beasts, and took their deadly aim from the thickets. In one point they were greatly inferior to the other tribes; for, being an inland people, they could not swim, and such was their ignorance, or dread of the water, that any stream which they could not ford was considered a sufficient defence against them. It may well be supposed that such men would be impatient of slavery; some who were taken by the Portuguese refused to eat, and died by that slowest and most resolute mode of suicide."—*Southey's History of Brazil*, vol. i. p. 295.

Mr. Southey observes, "That the English were at this time endeavouring to establish themselves in Brazil; and choosing their position better than the French, though not with better fortune, they fixed themselves in considerable numbers at Paraiba do Sul. There they connected themselves with the native women; and in another generation the Anglo-Tupi Mamalucos might have been found dangerous neighbours, if the governor of St. Sebastian's, steadily pursuing the system of his court, had not, in the fifth year of their abode, attacked and exterminated them. They who escaped from the merciless war which the Portuguese waged against all interlopers, fled into the interior, and either they were eaten by the savages as was believed, or lived and died among them, becoming savages themselves."

Spain took little interest in a country so inferior, as was then believed, in mineral wealth to her own colonies. By the subjection of Portugal to Spain, the colonies of the former were involved in hostilities with England, whose merchants had commenced trading to Brazil.* In 1588 three English vessels, commanded by Fanton, were attacked, in the harbour of San Vincente, by a Spanish squadron. The action began in the evening, and continued as long as the moon gave them light, by which time one of the Spanish vessels was sunk,† and on the following morning the British captain put to sea. This was the first act of hostility committed by the English in Brazil, and they were not the aggressors. A fleet subsequently fitted out by the Earl of Cumberland, and commanded by Witherington, entered the Reconcave of Bahia, and plundered it; the city was preserved by the Indian archers. The infamous Cavendish infested the Brazilian coast as a freebooter in 1591. A remarkable expedition was made, in 1593, by Sir James Lancaster to Pernambuco. He had by his own account, "been brought up among the Portuguese, had lived among them as a gentleman, served with them as a soldier, and dwelt among them as a merchant;" there was "a kind of moral treason," Mr. Southey very justly remarks, "in his bearing arms against a people with whom he had so long domesticated. But he appears to have conducted himself with so much moderation and humanity as almost to deserve forgiveness for his treachery." Pernambuco was taken.

"Lancaster led the way," continues Mr. Southey; "the fort began to play upon them, and struck away great part of the ensign of the galley. They run her aground right under the battery, within a coit's cast of it; her back was broken with the shock, the sea made a breach over her, and she sunk instantly; the other boats did the like. There were seven brass guns in the fort, which the Portuguese pointed so steep downwards, that their shot were spent in the sand, only one man being wounded. Lancaster exulting at this, for a well-aimed discharge must have been murderous, exclaimed, Upon them, upon them! all, by God's help, is ours! They ran forward to storm the place; the Portuguese lost heart, retired into some near bushes, and being pursued, fled by a way which was still dry, the tide not having reached it. Lancaster then made signal

* The first Englishman who is mentioned as having traded to this country, is Master Wm. Hawkins, of Plymouth, father of Sir John Hawkins, "a man much esteemed by Henry VIII., as a principal sea-captain. He armed a ship of his own, of 250 tons, called the *Paul of Plymouth*, wherewith he made two voyages to Brazil, one in 1580, and the other in 1592; in the first of which he brought a Brazilian king, as they termed him, to present him in his wild accoutrements to King Henry—at the sight of whom the king and all the nobility did not a little marvel, and not without cause. One Martin Cockeram, of Plymouth, was left behind in pledge for him. The Brazilian remained nearly twelve months in England, and died on his passage home, which was feared would turn to the loss of the life of Martin Cockeram, his pledge. Nevertheless, the savages being fully persuaded of the honest dealing of our men towards their prince, restored him without any harm."

† "By reason," says Lopez Vaz, "that these ships were weakened with former tempests, and were manned with the refuse of all the Spanish fleet, (the sicke men and women being embarked therein,) the Englishmen easily put them to the worst, and sank one of them, and might also have sunk another, if they had been so minded; but they desired not the destruction of any man, and doubtless it is the greatest valour that any man can show, that when he may do hurt he will not."

for the ships to enter: he left a garrison in the fort, planted its guns against Olinda, from which quarter he apprehended most danger, and marched to the base-town, as he calls Recife, which contained at that time rather more than a hundred houses. The people, at his approach, embarked in caravels and boats, and abandoned the place, leaving the rich lading of the carrack and great store of country produce to the conquerors.”*

The sole purpose of this piratical voyage being plunder, the vessels were laden with every thing that was really valuable, and they sailed from “the city of gold” and reached England in safety. The success of Lancaster’s enterprise would no doubt have encouraged other freebooters to undertake fresh adventures to Brazil, had not a more tempting lure been held out in the fabulous El Dorado.

We have in a former book given briefly an account of the settlements of the Dutch and their expulsion from Brazil; and from that period until its independence, this magnificent region remained a colony of Portugal.

The contests for the dominion over Brazil caused so high a reputation of its vast territory and natural riches, that after the departure of the Dutch, John IV. of Portugal conferred the title of Prince of Brazil on his eldest son, Theodosius; a dignity which continued to be afterwards enjoyed by the heir-apparent to the crown.

The Jesuits, who had previously founded their establishments on the Parana, exerted wonderful and meritorious efforts to prevent the enslavement of the aboriginal nations of Brazil, and of the territories through which the rivers Paraguay and Parana flowed. Their zeal, in this mission of humanity, rendered them exceedingly hateful to princes, and to certain ecclesiastical orders. The Franciscans, especially, actually derived a profit from the internal slave-trade; and they insinuated artfully, and then proclaimed openly, every calumny which could prejudice the world against the most humane and useful missionaries that ever endured the fatigues, privations, and sufferings, inseparable from traversing the vast wilderness regions of both the Americas. Through the malignity of the Franciscans, a report was generally circulated, and believed, that the Jesuits on the Parana and Paraguay, worked for the general benefit of their order, the richest gold and silver mines in the world. This false charge extended its malicious purpose to the Jesuits in Brazil.

Laws had been passed to protect the natives, but the speculators in the lands in Brazil continued to enslave, and subject, them to the most abject and severe labour. Great cruelties were, in consequence of the system of slavery, inflicted on the poor natives in the older captaincies, and the example was followed with additional oppression in Para and Maranhão.

These atrocious iniquities† had nearly exterminated the natives of the maritime

* “Southey’s History of Brazil,” vol. i., p. 387.

† The Portuguese laws allowed, that aborigines captured in *just war* were slaves; also those made prisoners in war with each other when purchased by the Portuguese: the pretence of just-

captaincies, when the Jesuit Vieyra arrived in Maranham, and partially succeeded in suppressing the slave-trade.

The Paulistas, a mixed breed of Portuguese and aborigines, and called vulgarly *Mamalukes*, were the most intrepid slave-hunters. They were also the most determined enemies of the Jesuits, and nearly deposed the governor who had countenanced that very remarkable man, Vieyra. Some time after, in 1673, an attempt at revolution broke out in the province of Maranham, headed by Manuel Beckman, an old German or Dutch Paulese, but born at Lisbon. His insurrection cry was, "Expel the Jesuits!—Abolish all monopolies!" They surprised the city, captured it, possessed themselves of the arsenal and fort, and imprisoned the governor in his own house. The revolters continued in occupation until the arrival of Gomes Freire with a force from Lisbon; which soon vanquished the insurgents, and Beckman was banished. This restored tranquillity to the most lawless province of Brazil. In 1694, a revolt much more serious broke forth in the province of Pernambuco. The origin of this insurrection was the giving of arms to the negroes during the contests with the Dutch. Of these negroes, when armed at the capture of Olinda, several escaped, and established themselves in a strong forest position west of Porto do Calvo. Nearly all the runaway negroes afterwards found their way to this celebrated rendezvous. Their numbers soon became formidable. Like the first Romans, they were without women; but they supplied this want by descending suddenly upon the plantations, and carrying off violently every woman of colour. They established equal laws among themselves; they occupied a fertile boundary; their numbers increased with astonishing rapidity; they made no scruple in plundering the Portuguese settlements; and they finally constituted a nation under the name of the *Palmarese* (from the great palm forests of their region). They formed a government under an elector, or monarch, named *Zombi*. They surrounded their chief town and villages with stockades, and managed to procure, even from the Portuguese planters, abundance of fire and other arms and ammunition. During a period of forty years they remained unattacked, and unmolested; but having increased to the number of more than 20,000, the Portuguese government became so thoroughly impressed with the formidable power of this new nation, that in 1696, it was determined to extirpate the *Palmarese*, at whatever expense of money or of men.

John de Lancastro, with an army of 6000 troops, well provided and armed, marched against the city of the *Palmarese*. The latter, unable to meet the former

fication for which was, that the latter would otherwise have been eaten at the *mussarama*, and were called natives of the cord, all the evils of a regular slave-trade necessarily arose under these barbarous laws. Every captain of a fort made reckless war against the nearest tribes, for the mere purpose of capturing slaves. The slave-traders on obtaining all they could seize by fraud or force, brought them forward for the mere form for examination, as *Cord-Indians*, answers were obtained which were readily accepted by judges implicated in the atrocious violence.

"One captain having got the chief of an Indian village in his power, fastened lighted fuses to each of his fingers, which were to burn there till he delivered himself from the torture, by giving a certain number of slaves."—*Southey's History of Brazil*.

in the field, retired, to the number altogether of about 10,000, within the defences of the town. The Portuguese army advanced and laid siege to the place; but they were greatly disheartened on beholding the formidable condition of the defences, and being without artillery, they were unprepared to besiege the town in regular form. They were soon greatly harassed by murderous sallies from the town. Whenever the Portuguese approached they were dismayed by a furious resistance on the part of the negroes; who not only with fire-arms and bows and arrows, but with spouting scalding water, galled and frequently repulsed their assailants.

This was an apparently hopeless siege on the part of the Portuguese, until the ammunition of the besieged was exhausted, and their supplies of provisions were cut off. Scarcity was assuming the aspect of famine within the town, and a strong reinforcement having arrived in aid of de Lancastro, the place was stormed and taken. The king, Zombi, and his chief adherents, resolving not to be captured alive, leaped over the high rocky precipices of the fort, and were instantly dashed to death. The captured inhabitants were all sold as slaves; and this terminated the first negro kingdom in America.

In 1699, gold was discovered, and in 1729-30, the diamond wealth of the country was also developed. But if Portugal was enriched by gold and precious stones, which we much doubt, we believe that the discovering and working of these mines amounted to the infliction of a curse and of moral degradation on Brazil.

The town of *Rio Janeiro*, or St. Sebastian, and the surrounding country, enjoyed from the foundation, and settlement of both, by the Portuguese, the advantage and happiness of not being attacked by any European power.* Unlike the condition of the northern provinces, domestic tranquillity and comparative prosperity prevailed in the province of Rio Janeiro.

To the region of the gold mines, discovered in the first year of the eighteenth century by the Paulistas, was given the name of Minas Geraes. This inland province became a dependency to the city of Rio de Janeiro. Agriculture was soon nearly abandoned for gold digging; the price of slaves became enormous; the general prosperity of the country retrograded; all resorted to the gold mines to accumulate wealth with rapidity. The fame of these golden resources went forth to Europe. France determined that these riches should not be monopolised by Portugal. A squadron, under the command of M. Du Clerc, sailed from France, and appeared off the shores of Brazil in 1710. In a few days about 1000 armed men were landed at Guaratiba, about forty miles from Rio Janeiro. Guided by two captured negroes, this force marched to the capital; then garrisoned by 8000 regular troops, exclusive of 600 Indian archers, and

* The Portuguese having imported diamonds for some time before from Goa, at first discouraged the search for diamonds in Brazil, but, finding the mines prolific, they soon considered them as inexhaustible sources of wealth.

numerous bands of armed negroes. Francisco de Castro, the Portuguese governor, is accused of culpable neglect, in allowing the French to approach the city and not even attempting to molest them when encamped in an old Jesuit sugar plantation, called *Engenho Vello*, now one of the principal suburbs of the city. We doubt the justice of the charge made generally by historians against the governor. It is more probable that he acted on a designed plan of entrapping the French. He intrenched himself with his forces in the square of the old town, with the right wing of his forces extending up the hill of the Concepcion, the left up that of St. Antony. The French passed round the latter hill by the road of the Ajuda, entered the city unrepelled; and, in two divisions, marched, the one towards the palace, the other to the convent of St. Benedict. The governor, called by all historians imbecile, now headed his troops, fell on the French, of whom many were cut down and killed in the streets, and no less than 250 wounded. The remainder with their commander, were captured and imprisoned. Le Clerc was assassinated at night, and most of the captains were secretly murdered. The barbarity of the Portuguese was severely avenged. On the intelligence reaching France of the discomfiture of the expedition under Le Clerc, and of the atrocious sacrifice of men who had surrendered as prisoners of war, it was resolved by individual enterprise, that a powerful armament should be expedited against the Portuguese settlements in Brazil.

Among those who resolved to avenge the barbarous assassination of Le Clerc and the French prisoners at Rio de Janeiro, there appeared Duguay de Trouin, one of the most gallant naval officers of the age. The government approved of the heroism and liberality of those persons who undertook the expense and the responsibility of the chivalrous undertaking, and De Trouin was invested with the command of a powerful naval armament.

This fleet arrived before Rio de Janeiro on the 12th of September, 1711, and having previously ascertained the bearings of the entrance, De Trouin sailed into the harbour, but not without a loss of nearly 300 men from the fire of the forts on passing the Narrows. With his bomb-ships, he advanced on the following night, and next morning possessed himself of Iha das Cobras, divided only by a narrow channel from the city. He landed his troops and erected batteries. The governor, as on the previous year, merely intrenched himself in the same position within the city. His force was in number double that of the enemy. The French, meantime, pillaged houses, and carried off the cattle within a few hundred yards of the town.

De Trouin, with his inferior force, presuming it impracticable, either to prevent the citizens removing their effects to the neighbouring mountains, or to engage, as Le Clerc had most rashly done, in a street warfare, demanded an unconditional surrender of the city. The governor returned a spirited refusal. De Trouin then prepared for a general attack. He decided on possessing five Portu-

guese merchant-ships which lay at anchor near the shore, and close to the Benedictine Convent, in order that they might serve for the reception of troops, to land afterwards, and attack the town. *During night*, boats with French troops attempted to board these ships; a thunder-storm came on; the boats were discovered by the lightning, and the Portuguese musketry fired on them, and caused some confusion; the plan of boarding the ships was abandoned. De Trouin at once brought up his troops; and the cannonade opened furiously on the city, and was continued during the whole night, simultaneously with the thunder and lightning. Many houses were set on fire by the shells, and the thick stone walls of the Benedictine convent are said to retain to this day marks of the destructive effect of the French cannon balls.

A contemporary French writer observes—"The simultaneous roar of the cannon and the thunder, rendered more terrible by the repeated echoes of the surrounding mountains; the mingled glare of the batteries and the lightning, filled the inhabitants with terror, as though heaven, earth, and hell had broken loose upon them at once."

The citizens, men, women, and children, during this most tempestuous war of physical and artificial elements, and in the most terrific night, ever experienced, fled to the wild heights of the adjacent mountains of Teguca. The troops within the entrenchments were dismayed. At daybreak they prepared to take the city by storm, when an aide-de-camp of the late Du Clerc, who had managed to save his life, came forth and informed the French commander that the city was abandoned. De Castro intended to blow up the forts of the Jesuits and Benedictines but was prevented, and the city was soon after occupied by the forces of De Trouin. The captives of the expedition under Du Clerc, who had escaped the massacre, broke out of prison during the night, and on the entrance of De Trouin, were actively engaged in plundering the deserted houses. A general sacking of the city followed. The houses of some citizens who had extended charity and kindness to the French prisoners, were spared from pillage; but the excesses of the French sailors and troops were abominable.

More than three-fourths of the dwellings and warehouses had been broken into, and the wine, provisions, stores, and goods of every kind, were thrown into the streets. A scene of riot ensued, and it was said that the Portuguese governor might at that time have crushed the invaders. De Trouin, shot some of his men, but a few summary punishments were not sufficient to resist temptations of plunder, rapine, and drunkenness. He, however, allured many to work, and bring off the most valuable merchandises. De Castro had encamped about three miles from the city, expecting a reinforcement from the mines. De Trouin, confident that if he continued too long where he found no certainty of provisions, without difficulty and danger, informed the governor, that unless the city were immediately ransomed, he would burn to the ground every

building within its precincts. Six hundred thousand cruzados, about eighty-four thousand piastres, were offered and accepted as the ransom of the town: the citizens having the pre-emption of redeeming their merchandise. Among the articles of plunder were a great number of boxes of sugar. The loss caused by the expedition of De Trouin was enormous. Besides the ransom money a prodigious amount of property was either plundered or devoured by fire. Three line-of-battle ships, two frigates, and more than thirty merchant vessels, were either taken or burnt.

De Trouin shot every Frenchman detected in plundering churches. He, however, collected together all the church-plate that was found, and intrusted its preservation to the Jesuits, who were "the only ecclesiastics" he said, "in that city that had appeared worthy of his confidence."

He sailed from Rio Janeiro on the 4th of November, determined to attack Bahia, but after having struggled with adverse winds, for nearly six weeks, he bore away for France.

Two ships of his squadron, during the tempest encountered on their way homewards, foundered, with 1200 men on board. One of them, was the best ship, and carried the most valuable plunder, including gold and silver to the value of 600,000 livres. A third vessel, driven into Cayenne, sunk at anchor. But, exclusive of the loss of these ships, the individuals who risked the expense of equipment are said to have made a profit of ninety-two per cent upon the capital they had invested. This expedition, like those of Drake and Hawkins, cannot rank above piratical expeditions.

Francisco de Tivora was sent out as governor to supersede De Castro, who was tried for cowardice, &c., at the court of Lisbon, and sentenced to degradation, and perpetual imprisonment, in one of the forts of India, though he pursued the same course as on the former year, when having been successful, his faults were overlooked.

Since the day on which Duguay de Trouin's squadron sailed away, no enemy's fleet has ever entered the harbour of Rio de Janeiro.

In 1763 the seat of government was removed to it from Bahia, and from that time it became the residence of the viceroys.

Although the province of Rio Janeiro, and its dependent region of Minas Geraes, enjoyed tranquillity, incessant disputes were continued between Portugal and Spain, relative to their respective settlements on the banks of the Rio de la Plata and its tributaries. In 1750 a convention was entered into by which their limits were established, and Portugal resigned the settlement of Santo Sacramento to Spain, in exchange for seven of the Jesuit missionary settlements on the banks of the Uruguay. About 30,000 baptised aborigines, of the Guarany tribe, with their wives and children, were, by this reckless act forced to remove from the land of their fathers to an unknown territory. The Jesuits had long resided among them. They appealed against the arbitrary removal of a

people among whom they had been eminently successful in civilising. But the efforts of the Jesuits were disregarded, and the period was now approaching when this celebrated order excited the suspicions of nearly all European governments.*

The Guarany nation at first resisted the order to abandon their lands: they were forced, after great slaughter, to submit to the tyranny of their diabolical oppressors; and it was deemed a misfortune with respect to them that the Jesuits were their friends.

When Charles III. ascended the throne of Spain, in 1761, the treaty of limits was annulled; and the Guaranies were invited back to their ruined country. The Jesuits endeavoured to repair the wrongs which the remnants of the expelled tribes had endured. The efforts of the Jesuits were great and praiseworthy; yet their very humanity, and success, increased the jealousy and suspicion previously entertained against them.

The great enemy of the order was a personage, as honest, yet, as mistaken in his views, as unsound in his commercial and colonial policy, as was any statesman who has ever appeared prominently among the nations of Europe. Sebastian Joseph de Carvalho e Mello, afterwards best known by his title as the Marquis de Pombal, became the prime minister of Charles III. of Portugal. With very laudable ambition, he considered himself born to regenerate the kingdom, and to raise the colonial empire of Portugal, in America, in Africa, and in the Eastern Indies, to a condition of prosperity, wealth, and power, which would eclipse the vast colonial empire of Spain, and cast into a shade, of comparative insignificance, the navigation, commerce, and colonies of other European powers. He considered the mineral, agricultural, and commercial resources of Brazil so great, and inexhaustible, that he even contemplated founding a new capital, for the Portuguese empire, in the province of Minas Geraes. We do not assert that some of his ideas would not have been beneficial if rightly directed; but certainly no statesman ever conceived greater fallacies. Yet they all teemed with designs, characterised by the grandeur of their illusions. We must allow him that justice, which is eminently due to this very extraordinary man, though not wise statesman. In a country where ignorance, superstition, and intolerance prevailed more generally, at the time, than in any other country in Europe, he came boldly forward to rescue, according to his views, Portugal and her colonies from social, political, and commercial degradation. He had the moral courage, in despite of the Inquisition, and the opposition of the regular and secular ecclesiastics, and of a prevalent bigoted and religious superstition, averse to all change and reform, to bring forward his plans regardless of all obstacles. The regular and secular orders were at the time jealous of each other. They agreed in nothing but mutual hatred to the Jesuits. Carvalho, not wisely, held all the ecclesiastics, except the Jesuits, nearly in contempt. As for the friars, he considered that it would be advantageous to the

* See chapters hereafter on Paraguay, Parana, &c.

country, and not difficult, to abolish their clerical existence—nay, even the extinction of their lives would not have been repugnant to his views of national utility. It must at the same time be admitted that the higher ranks of priests, as well as all other, required reformation in their morals, and great amendment in their education.

By annihilating the friars and reforming the priesthood, he believed that the authority of the pope would be greatly diminished in Portugal and in Brazil. But, the intelligent, and able Jesuits were too powerful, not to be feared by the prime minister; and he unfortunately considered that they would prove the chief obstacle to his reforms, and that if their order were completely suppressed, he might then proceed unobstructed by any difficult impediment with his plans. He was most egregiously wanting in judgment and forecast. We are far from being the advocates of the *institute* of the Jesuits; but, considering the ignorance of Portugal, and the condition of Brazil, they were the men of all others, who could have the most effectually aided the minister. They would not certainly have given him faithful support in order finally to establish either civil liberty and perfect religious freedom. Pombal had not such enlarged views. His ambition was to elevate Portugal, and her colonial and maritime power, to the rank of absolute grandeur. Therefore, before proceeding in the measures which are mis-called his reforms, he decided on crushing the only intelligent order then to be found within the whole ecclesiastical institutions of the Portuguese empire. In fact, when Carvello, at the age of more than fifty, became the prime minister of his country, he possessed those abilities and manners, which enabled him to acquire a thorough domination over the mind of his sovereign. He was, therefore, invested by the latter with absolute power. In proceeding to carry into effect measures, which we believe were honestly conceived by him, and which he considered, with integrity, to be necessary for regulating and aggrandising the empire, he utterly disregarded the severity of the means which were to be adopted. His enemies are not even accused of exaggeration, when they characterised him as destitute of both the virtues of humanity, and the scruples of conscience.

He, therefore, with extraordinary confidence in his own wisdom and abilities, commenced fearlessly, bold and violent measures, and persevered in their execution with reckless perseverance. He employed his brother, Francesco Xavier de Mendoza Fiutado, as captain-general of Maranhão and Pará, to suppress the Jesuits in Brazil. Fiutado treated the Jesuits, in the same spirit that actuated Carvelho in his general policy. The Jesuits had their advocates in Portugal, but Carvelho, now created Marquis of Pombal, was absolute. He might then truly repeat what Louis XIV. said of the state. In fact, the *state* was *Pombal*.

In 1760 the final expulsion of the Jesuits from Brazil was carried into effect ignominiously and with extraordinary hastiness. Fiutado informed them that they might, after their departure, serve the Deity with less patience and suffering than they had practised.

The churches, colleges, houses, lands, and other property of the Jesuits, were seized and confiscated by the crown. Their books and papers were also taken from them. Their hospitals were invaded, and the patients compelled to leave their beds, some of whom died on being removed. At St. Paul's, only, were they treated with some humanity in their disgrace; the bishop of which, Fr. Antonio da Madre de Deos, said publicly, "that the expulsion of the Jesuits would draw after it the ruin of religion first, and the overthrow of the government afterwards." At Rio de Janeiro, the place of embarkation from the south, 145 were stowed below decks in one ship, like African negroes; for these the surgeon obtained some alleviation, by assuring the captain, that if he persisted in confining them below, not one of them would live until they should reach Lisbon.

On arriving at Lisbon, as prisoners, they were cast into prison, and never heard of until the king's death and the disgrace of Pombal. After a confinement of eighteen years, those who survived were liberated. Others, who arrived in the Tagus, were not permitted to land, nor to communicate with friend or kinsman; but were then placed on board other vessels, sent to the Mediterranean, and landed without means, on the Roman States.

The Jesuits transported from Pernambuco, especially in a missionary ship those which had belonged to the order, were treated with extraordinary harshness on the voyage.

The expulsion of the Jesuits tended rapidly to barbarise the Portuguese settlements, and to prevent the civilisation of the aborigines.

The intercourse of foreigners was now strictly interdicted,—and Pombal inflicted on that empire, a non-commercial intercourse system which began to be exploded in other countries. He introduced the system of exclusive trading companies. He limited the very trade of port wine to a monopolist association. He inflicted on the northern provinces of Maranhão, Pernambuco, and Pará, the limitation of their whole trade to an exclusive company. He fixed a special price on the shares of this company, and passed a law that these shares should, at the price fixed, by him, be a legal tender for all payments whatever. This fallacious, unjust, and unwise measure, turned out a miserable failure. No one had any confidence in the credit of a company established on so rotten a basis. Fourteen ships were at first employed in the trade of the company; the number soon declined to four,—and after the disgrace of Pombal, this pernicious company was suppressed.

It is not within the purpose of this work to enter further into the administration of this unfortunate minister. Having fully examined his plans, which were chiefly fallacious, and analysed, with care, his manners and his character, we may conclude with observing, that a prime minister, at that period, with the power, energy, boldness, and perseverance of a Pombal, and the judgment and forecast of a Franklin, would have rendered Portugal one of the richest, most improved countries in Europe, and Brazil by far the most advanced empire in America; the United States of the north excepted.

In 1762, when the war between England, France, and Spain broke out, the latter power seized on Colonia, a Portuguese settlement in the south. Freyre, the governor of Brazil, despatched a squadron, chiefly English privateers, commanded by an Irishman, Captain Macnamara. He reached the place too late to prevent its capture, but was on the point of silencing the batteries and retaking it, when his ship caught fire, and three-fourths of his crew, including the captain, were drowned. The other ships returned to Rio de Janeiro. This was the first time that the English assisted the Portuguese against their enemies.

In the year 1763,* when peace was concluded, Colonia reverted to Brazil, and the seat of government, under the viceroyalty of the Conde d'Acunha, was transferred the same year from Bahia to Rio de Janeiro, chiefly on account of the proximity of the latter to the gold mines, and to guard Brazil more effectually against the Spanish settlements on the Plata. Some attempts were also made, afterwards, to extend the boundaries south and south-westward, and in a few years the mining settlements were extended, especially those of Matto Grosso. Meantime the Jesuits' estates were grossly mismanaged, and the proceeds wasted; and the missions, which were transferred to other orders, gradually decayed. Tranquillity, however, was preserved during the period which followed to the end of the eighteenth century, with little interruption, excepting some disputes with the French on the frontiers of Cayenne; expeditions made to subdue the independent aboriginal tribes; and the attempt made at revolution in Minas Geraes, led on by a cavalry officer, nicknamed *O' Tiradentes*, the tooth-drawer. The revolvers gave as their grievance, the too large a share, exacted by the crown, of the produce of the mines. The object was to form the province of Minas Geraes into an independent state. Before they matured their plans for action, the leading conspirators were all arrested, and all banished, with the exception of *O' Tiradentes*, who was hanged.

During the first year of the present century, the Brazilian Portuguese attacked the Spaniards in the reductions which formerly were the battle-grounds in the expulsion-war against the Guaranies.† The latter nation was formerly the inveterate enemies of the Portuguese; but the injustice and cruelties of the Spaniards reconciled them to the advances of the Brazilians, whom they received as liberators. The Portuguese in consequence repossessed themselves of the reductions which formed part of the territories of Brazil.

* Forty-four governor-generals and viceroys had, before this date, ruled or reigned over Brazil, in Bahia.

† Portugal obtained the cession of these settlements on the expulsion of the Guaranies in 1753, it ceded them to the Spaniards in 1777, in exchange for their former province of S. Pedro, which had been taken from them during the war.

CHAPTER II.

EFFECTS OF THE INVASION OF PORTUGAL BY FRANCE—ARRIVAL OF THE ROYAL FAMILY IN BRAZIL—CONSEQUENT CHANGES—OPENING OF THE PORTS.

In 1807, the French army having invaded Portugal it became evident that Napoleon had resolved to subjugate the whole peninsula. On the 29th of November, the vanguard of the French army appeared on the heights above Lisbon, and the prince-regent determined upon emigration to Brazil. Every thing of value which could be carried off was hastily put on board the British squadron then commanded by Sir Sydney Smith at the mouth of the Tagus,—and of eight Portuguese ships of the line, four frigates, twelve brigs, and several merchant-vessels. This fleet, with the British commander, immediately sailed for and arrived safely at Bahia.

The citizens of Bahia offered to construct a superb palace if he would remain and re-establish the city as the metropolis—but the broad entrance of the bay, and the impossibility of rendering the port impregnable by fortifications, constituted objections which did not apply to the magnificent bay of Rio de Janeiro.

The prince landed at Bahia on the 25th of January, 1808, where he was received with enthusiastic joy. Spending a month in that city, he sailed and arrived, on the 7th of March, at Rio de Janeiro; but, before he departed, he granted the celebrated *CARTA REGIA*, by which the ports of Brazil were opened to foreign navigation and trade. The Viscount del Cayru, a Brazilian author and senator, who had been officially appointed to write a history of Brazil, which he unfortunately did not live to accomplish, says in his "*Memorias dos beneficios politicos do governo do Rei D. Joao. VI.*," that the *Carta Regia* was much superior to the English *Magna Charta* in its purposes, and that the Regent, "by that immortal diploma conferred an inestimable inheritance upon this terrestrial paradise, where flourish the crowned heads of the vegetable world; trees that blossom from the trunk to the vertex; health-giving plants, that banish death to a remote old age; and, besides, a thousand other equivalents for the riches of the globe; those princely fruits, which the poets and enthusiasts of natural history have named ambrosia—food for the gods. Opening the ports, without reserve, to foreign commerce, he established a direct correspondence between this and foreign nations, by which the people enjoy, through the wealth that nature has given them, what art has secured to other states, besides an exuberant supply of population, and a perpetual stimulus to industry."

Until the promulgation of this royal charter, all navigation and commerce with every foreign country and Brazil was rigidly prohibited. If vessels were driven by stress of weather into any Brazilian port they were confiscated if they belonged to an unfriendly power; if they were those of a country in alliance with

Portugal, neither passengers nor crew were allowed to land, except under a strong military guard.

The treatment experienced by Lord Anson's ships, at Rio Janeiro, was a case illustrative of the miserable colonial policy of Portugal. To prevent all possibility of trade, whether ships had put in to repair damages or to procure provisions and water, a custom-house guard, was placed on board, and the time for their remaining was fixed by the authorities. From these oppressive regulations, a people, who were rich in gold and diamonds, were unable to procure the common implements of agriculture and of domestic convenience. A *senhor de engenho*, who could display the most rich and massive plate at a festival, might not be able to furnish each of his guests with a table-knife. A single tumbler, at the same time, might be under the necessity of going the round of a whole company. There was no printing-press.* Books were scarcely ever seen. Industry and enterprize were paralysed by ignorance, bigotry, and despotism. Naturally, there was no country in the world richer than Brazil; none, in which Europeans had done less good.

When the royal family arrived, the several provinces were disunited and jealous of each other. They had little in common, excepting that the Portuguese race spoke the same language, and had relapsed into equal indolence; and that they received each every third year a new governor from Portugal.

During the year in which the ports of Brazil were declared open to foreign trade, more than ninety foreign ships, chiefly British, entered the port of Rio Janeiro. Two years afterwards, a most advantageous treaty of commerce was concluded with England, under which a most profitable trade was carried on, until that treaty was terminated in 1844, on the grounds of an imbecile, or dishonest hypocrisy, which excluded the sugars of Brazil from British markets.†

St. Catherine's was declared a free port. Books were imported; schools were established; the fashions and manners of Europe were introduced; and, considering the then ignorant and degraded condition of Brazil, it will appear that very great progress in civilisation had been made in that magnificent empire.

In 1815, Brazil was declared a kingdom. The queen-mother, who had long been in a state of imbecility, dying immediately after, Dom John VI. delayed the proclamation of his accession until the following year, when he was crowned King of the United Kingdom of Portugal, Algarves, and Brazil, on the 5th of February, 1818.

This was considered an auspicious event in the history of Brazil. But it

* A printing-press was established at Bahia in 1811, and a gazette, called "The Golden Age" was commenced, but with a censorship as its adjunct—a public library was also established by private individuals.

† The import duties on British products under this treaty were never to exceed fifteen per cent. They were at its termination far more than doubled—(see Brazilian Tariff at the end of this volume). We hope the recent sound policy, with respect to Brazilian sugars, will induce the government to adopt wiser fiscal and commercial regulations.

must not be overlooked, that there were elements of dissatisfaction attendant upon the arrival and residence of the royal family in the newly-created kingdom.

Many corrupt, idle, and needy adventurers accompanied the prince-regent from Portugal. They claimed, for their loyalty, places from the government; on being invested with office they took little interest in the welfare of the country; they enriched themselves, but were regardless of administering justice or ruling for the public good. A rivalry had always prevailed between the native Brazilians and the Portuguese.

On the conduct of the latter Mr. Armitage remarks, that—

“Don John, from his naturally obliging disposition, delighted in rewarding every service rendered to him or to the state; but being straitened for funds, he adopted the cheaper custom of bestowing titular honours upon those who had merited his favour. To such an extent did he carry this species of liberality, that, during the period of his administration, he distributed more honorary insignia than had been conferred by all the preceding monarchs of the house of Braganza.”

Landed proprietors, merchants, and others, on the arrival of the royal cortège, readily opened and often gave, their houses, and advanced their money, to those who accompanied the royal family. They were rewarded with decorations of various honorary orders. In most cases these honours were absurd. They were also unfortunate penalties upon those on whom they were conferred. Being ennobled, to remain in commercial life was considered as derogatory; they were, therefore, compelled to live either on the means which they had, or to solicit employment from the government.

Competition for office was, at the same time, increased by the numerous emigrants from Portugal. The emoluments of public offices were also limited to small salaries from want of funds.

“The venality,” says Mr. Armitage, “of the Brazilians in office, became ere long equal to that of their Portuguese colleagues. These things, together with the wretched state of morals that prevailed at court, were calculated to foment those jealousies of foreign dominion which could hardly fail to arise in view of the independence recently achieved by the English colonies of North America, and of the revolutionary struggle in which the neighbouring colonies of Spain were already engaged.

“Quietness prevailed for several years; but discontent became gradually disseminated, and was often promoted by the very means used for its suppression. Murmurs, too, were excited, but as yet they found no echo; the only printing press in the country being under the immediate direction of the royal authorities. Through its medium the public was duly and faithfully informed concerning the health of all the princes in Europe. Official edicts, birth-day odes, and panegyrics on the reigning family, from time to time illumined its pages, which were unsullied either by the ebullitions of democracy, or the exposure of grievances. To have judged of the country by the tone of its only journal, it must have been pronounced a terrestrial paradise, where no word of complaint have ever yet found utterance.”*

The warfare carried on in the south of Brazil against Artigas, and for the reduction to complete obedience of the province of Rio Grande do Sul, was very expensive, and for some years far from successful. The war on the part of

* “*Vide* Armitage’s Continuation of Southey’s History of Brazil;” “Kidder’s Sketches of Brazil,” New York, 1844

Brazil against the republicans of La Plata was also carried on as a destructive warfare against the agricultural settlements.

In 1809, an event of some importance occurred. The court of Rio now resolved on recovering Portuguese Guiana, which had been ceded to France by the treaty of Amiens in 1802, and a force under Colonel Manoel Marquez, supported by the English man-of-war *Confiance*, Captain Yeo, forced the French to surrender that colony on the 12th of January.

In 1817, an insurrection had broken out in Pernambuco. Its object was to overthrow royalty and to establish a republic. That port, however, was soon blockaded, and the troops from the other provinces subdued the insurgents, and the ringleaders were hanged.* Serious disorders broke out some time after at Bahia, where the Portuguese troops committed many outrageous excesses; and, at last, the city became a scene of bloodshed between the Portuguese and native Brazilian troops. The whole country seemed on the point of a revolution; and, on the 18th of February, 1821, the king nominated the Marquis de Alegrete and others, to take into consideration the constitution which had been promulgated in Portugal, as far as it could be made applicable to Brazil. The prince, Dom Pedro, soon after, read to the people of Rio a royal proclamation, granting such a constitution as should be framed by the cortes at Lisbon; and he took the oath to observe the constitution. The governors of Pernambuco, Bahia, and the other captaincies followed his example; all of which was confirmed by the king.†

In 1821, the state of affairs in the mother country compelled King John VI. to return to Europe, as the only chance of preserving the integrity of the monarchy. The cortes of Lisbon invited their sovereign to revisit his ancient capital, and deputies from Brazil were summoned to attend the sittings of the national assembly. The *Cortes* in Portugal, and the Portuguese generally, had become impatient of an absence of the sovereign, which reduced them to a condition scarcely superior to a colony of Brazil. Before the colonial deputies could arrive, the cortes had resolved that Brazil, should be brought back into an absolute dependence on Portugal. That they should revive all the restrictions

* On receiving tidings at Rio of this insurrection, the king is said to have exclaimed: "How is it that my subjects revolt? I have always tried to do them good; I do not know that I have injured any one. What do they wish for?"—*Luccock's Notes*.

† "The situation of the king," says M. la Beaumelle, "was critical. He was surrounded with numbers of Portuguese troops who were devoted to the system adopted by their comrades. The recent insurrection of Pernambuco showed that there was a republican leaven in the country. He consulted his love for his people; and on the 26th of February, before news could arrive of the installation of the cortes, he swore, at all hazards, to observe the constitution they should form, if one should be formed. The same oath was taken by his court, and, probably with less good faith, by the royal family. It would have cost little sacrifice to Dom John VI. to become a constitutional monarch: he had never loved or exercised despotism. If he had now and then employed his absolute authority, it was only to do good."—P. 68.

and monopolies of the exploded colonial system; and that England was to be deprived of her *free trade* to Brazil.*

On the 22nd of April, the king appointed his eldest son, Dom Pedro, regent of the new kingdom, with full powers to exercise all the functions of royalty. On the 24th, the royal family embarked, accompanied by many of the emigrant nobles.

Dom Pedro was, at this time, twenty-three years old. He was married four years before to the Archduchess Leopoldina, sister of the present Emperor of Austria. He assumed the reins of government under the difficult and perplexing circumstances of an empty treasury, a heavy public debt, and the provinces almost in revolt. Bahia disavowed his authority, and the cortes withheld their support from him. The regent reduced his expenditure to the monthly sum allowed his princess for pin-money; he retired to a country-house, observed the most rigid economy; and of 600 horses, which composed his stud, he retained only about fifty.† By great exertions he reduced the public expenditure from 50,000,000 francs to 15,000,000 francs. But the northern and internal provinces withheld their taxes, and Dom Pedro was reduced to a condition of little more power than that of governor of Rio Janeiro. The ministers of the king, his father, being Portuguese, were obnoxious, and suspected of being attached to the old order of government. To these difficulties were to be added the insubordination of the army, and the intrigues of the junta which were imposed upon him by the cortes. Dom Pedro, in consequence, requested to be recalled to Europe.

"At length," says M. de Beauchamp, "the Brazilians were disarmed by this noble conduct: they recognised his activity, his beneficence, his assiduity in the affairs of government; and the habitual feelings of affection and respect for the house of Braganza, which had been for a moment laid asleep by distrust, were awakened with increased strength. To these was joined an almost idolatrous sentiment of attachment for the virtues and splendid as well as amiable qualities of the young Archduchess Leopoldina, the daughter of the Emperor of Austria, and the beloved wife of the regent."

The king, after his arrival in Lisbon, found himself under the necessity of lending his authority to a constitution, which treated his Brazilian subjects as mere colonists. By this act a rupture between the two countries became inevitable. On the 4th of October, 1821, an attempt was made at Rio to proclaim the regent emperor. It was immediately suppressed, as the provinces were not then prepared for so great a revolution. The mere demonstration, however, increased the influence of the regent.

At the same time that Dom Pedro was refusing the imperial crown, the cortes

* Extracted from a manifesto of the Portuguese nation in 1821: "Commerce and industry, which can never prosper but under the benignant shadow of peace, had not only been despised and relinquished, but seemed even entirely destroyed by the unlimited licence granted to foreign vessels in all the ports of Brazil; by the fatal treaty of commerce with England in 1810; by the consequent decay of trade and national manufactures," &c. &c. See *De l'Empire du Brésil, considéré sous ses Rapports Politiques et Commerciaux*. Par M. Angliviel la Beaumelle. Paris, 1823.

† So says M. la Beaumelle. M. de Beauchamp says, "Réformant les 600 chevaux de son écurie, n'en gardant pas même cinquante."

of Lisbon, hurried on by passion, passed the decrees of the 29th of September. By one of these decrees Brazil was distributed into provincial governments, with their administrations centralised in the *bureau* of the minister for the colonies at Lisbon; by the same decree the superior tribunals in Brazil were suppressed. By another decree the prince regent was recalled to Portugal, and on his return he was to travel, *incognito*, through Spain, France, and England, accompanied by a retinue (or spies) nominated by the cortes. M. la Beaumelle remarks—"That it was impossible to conceive of any legislative enactments more exquisitely adapted to defeat the intentions of their framers. At the same time that they deeply irritated the natives by the parcelling out of the kingdom, they gave umbrage to all persons in office, a great proportion of whom were Europeans, by the suppression of the court and the tribunals; and what was still more offensive, they treated with gross disrespect the heir to the throne, in imposing upon him as a duty a tour, which, if advisable, ought to have been voluntary, and in assigning him an escort whom he could look upon only as so many spies. A centre was given to the emancipation, by the offer thus made to a prince of high spirit and resolution, of a country entirely ready to defend him."

These decrees arrived at Rio Janeiro on the 10th of December. Orders were issued for the election of a junta, to be installed on the 10th of February, in order that the prince might transfer the government to this body. The decrees were not to be submitted to, they were as obnoxious as the Stamp Act was in the old British American colonies. The provinces of Saint Paulo, Rio Janeiro, Minas Geraes, and Rio Grande do Sul, presented bold addresses to the prince. The president of the municipal deputation of Rio Janeiro expressed himself in almost menacing terms: "The departure of your royal highness from the states of Brazil, will be the decree that will seal for ever the independence of this kingdom;" an independence which would have caused its distribution into federal republics. Dom Pedro understood this, and he resolved to disobey the decrees of the cortes, and declared to the municipal senate of Rio Janeiro that*—

* Mr. Kidder observes, "In the office of prince regent, Dom Pedro certainly found scope for his most ardent ambition; but he also discovered himself to be surrounded with numerous difficulties, political and financial. The cortes of Portugal, about this time, becoming jealous of the position of the prince in Brazil, passed a decree ordering him to return to Europe, and at the same time abolishing the royal tribunals at Rio. This decree was received with indignation by the Brazilians, who immediately rallied around Don Pedro, and persuaded him to remain among them. His consent to do so gave rise to the most enthusiastic demonstrations of joy amongst both patriots and loyalists.

"The measures of the cortes of Portugal, which continued to be arbitrary in the extreme towards Brazil, finally had the effect to hasten, in the latter country, a declaration of absolute independence. This measure had long been ardently desired by the more enlightened Brazilians, some of whom had already urged Dom Pedro to assume the title of emperor. Hitherto he had refused, and reiterated his allegiance to Portugal. But he at length, while on a journey to the province of S. Paulo, received despatches from the mother country, which had the effect to induce him instantly to resolve on independence.

"Since it is for the good of all, and for the general happiness of the nation, I have decided—tell the people that I remain." This notification was made public on the 9th of January, 1822. It was received with enthusiastic acclamations. A report was spread that the Portuguese troops were about to force the decrees of the cortes into execution, and to carry off the prince. This report further roused the popular indignation; and in consequence the Portuguese general, Avilez, resigned the command of his regiment, and demanded to be allowed to return to Europe. On the night of the 11th, the troops took up arms, either to choose a new commander or to detain their old one. The Brazilians rose also immediately in arms. In a few hours the field of Saint Anne was covered with native troops and a multitude of armed citizens. Both sides were provided with artillery, and a battle was decided upon, when suddenly the European troops consented, to admit that, without fighting they were conquered, and then crossed over to Praja Grande, on the opposite side of the bay. There, however, they assumed a menacing attitude, declaring that they would remain at Praja Grande till the arrival of an expedition then expected from Portugal. The prince equipped some armed vessels, and summoned reinforcements from Saint Paulo and Minas Geraes. He blockaded the Portuguese force by sea, and surrounded them by land. He embarked on board his commander's vessel, seized the match of a gun directed against the Portuguese forces, and exclaimed, as he showed himself to their general, "This gun is mine, and you will take notice of the first shot, for it will be of my firing." The Portuguese troops, on the 12th and 13th, embarked and set sail from Brazil, never to re-appear on the shores of that empire. They were scarcely out of sight, when a signal was made of the appearance of another fleet, with 1800 troops. This armament consisted of several men-of-war, on board of one of which was commander Maximilian, with orders to convey Dom Pedro back to Lisbon. His instructions were to place himself, on his arrival at Rio, under the orders of the prince. "The only order I have to give you," said the prince, is to go back;"—the troops were not suffered to land, and the whole of the expedition, with the exception of a frigate which the prince detained, set sail, in consequence, for Europe.* The inhabitants of Pernambuco had, before

"His exclamation, 'independence or death,'† was enthusiastically reiterated by those who surrounded him, and thenceforward became the watchword of the Brazilian revolution. This declaration was made on the 7th of September, and was repeated at Rio as soon as the prince could hasten there by a rapid journey.

"Jozé Bonifacio de Andrada, prime minister of the government, had, in the meantime, promulgated a decree, requiring all the Portuguese who were disposed to embrace the popular cause, to manifest their sentiment by wearing the emperor's motto, 'independencia ou morte,' upon their arm—ordering also, that all dissentients should leave the country within a given period, and threatening the penalties imposed upon high treason against any one who should thenceforward attack, by word or deed, the sacred cause of Brazil.

"The Brazilian revolution was comparatively a bloodless one, and Portugal has never been able to make an effort to recover her authority over that empire."

* On his return to Lisbon, the commander was brought to trial for having literally followed his instructions, and degraded.

† "Independencia ou Morte."

they knew of what had transpired in Rio Janeiro, expelled all the Portuguese troops from that province.

The cortes, alarmed by the news of these proceedings, decided on withdrawing the obnoxious decrees. Eight days only before the receipt of the prince's despatches, they had ordered the suppression of the last central institution which remained in Brazil—the Marine Academy of Rio Janeiro. On the 6th of March they resolved, that further discussions respecting the constitution, with regard to Brazil, should be suspended until the deputies from that country had been heard. Four days after, it was determined that the academy at Rio Janeiro should remain unmolested. A commission of the cortes then proposed to suspend the departure of the prince and the abrogation of the junta; and also to supersede the disorganising of the central governments. Brazil was also to be offered one or two delegations of the executive power. These proposals were merely intended to allure the Brazilians, and while these discussions were occurring at Lisbon, Minas Geraes and the captaincy of Espiritu Santo adhered openly to the new Brazilian policy, and the citizens of Pernambuco had committed themselves too far to recede. All the southern provinces, the population of which formed the majority of that of the whole empire, styled themselves the Allied Provinces. The prince, in consequence, gave orders that each province should choose one or more attorneys-general, who should collectively form a council of state, of which he was to be the president. The cortes at Lisbon soon after decided, that there should be appointed to Brazil as many governors as the provinces should wish for. The Brazilian deputies to the cortes had defended every interest of their country, but a majority of the cortes had passed this impracticable resolution in opposition to their remonstrances. The deputies unanimously refused to subscribe to the Portuguese constitution, and quitted Lisbon; “thus,” remarks M. la Beaumelle, “breaking in the hands of the rulers of Portugal, the fetters they had forged for Brazil.” The province of Bahia declared in favour of the Brazilian government; the next day after this declaration arrived in Lisbon, all the inhabitants of Bahia, resident at Lisbon, sent in their adherence to the appeal of their countrymen.

At Rio Janeiro, on the 13th of May, the people proclaimed the prince perpetual protector of Brazil, the title to be hereditary. The Brazilians, at first, confined their demands on the cortes to an equality of co-operation in the legislative power, a local delegation of the executive power, central magistracies, and *a free trade*. Now they insisted on a separate legislature, with only an alliance between the two nations, under the protection and direction of the same monarch. All parties, however far they differed on other points, were unanimous in opposing a re-union with Portugal. Before the provincial delegates, who were to form the council of state, had assembled, the local authorities demanded a constituent and legislative assembly. The council of state, at its first sitting

declared its incompetency, and the prince, by his decree of the 3rd of June, declared that a Brazilian union of estates should be convoked, and represented by an elective assembly.* The deputies to the cortes had been instructed to stipulate, 1. That Brazil should have an independent national representation; 2. That the country should always be governed by the next heir to the crown, being of age, when the king should be in Europe; and 3. That the seat of government should be alternately in each of the two kingdoms. These demands were peremptorily rejected, and a mandate was passed for the return of the prince to Portugal.

The cortes of Portugal, on the 19th of September, 1821, resolved "that the convocation of the Brazilian assembly was null and void; that the government of Rio Janeiro was illegal; that the powers of the prince should cease; that he should be compelled to return to Europe within four months on pain of forfeiting his hereditary rights; and finally, that the ministry, and all commanders, naval and military, should be responsible for their obedience to the intrusive government."

This impotent edict only precipitated the eternal separation of Brazil from Portugal. The assembly of Brazil was installed on the following year. The administration of the prince regent was transformed into an imperial government; his ministers implicitly executed his orders, and each commander submitted to his authority.

The Brazilians did not at first seriously intend a separation. The rash folly of the cortes, however, consummated the independence of the Portuguese empire in America. All the provinces united: Bahia joined; and even Monte Video, an independent state, solicited a re-union with Brazil. A squadron sent from Portugal with all the troops which that feeble government had the means of transporting arrived at Bahia, and occupied that city. General Madeira, the Portuguese commander, was unable to extend his power beyond the walls; the whole province, even the islands in the bay, remained faithful to the union. The provinces of Para and Maranham, beyond the walls of their capitals, also maintained independence of the rule of Portugal. At length, the cortes, in their imbecility and utter weakness, affected to thunder forth power, by curtailing the period which they had in a former decree allowed the regent for his return; and in case of disobedience, declared his exclusion from the throne of Portugal. They prohibited the exportation to Brazil of all arms and ammunition, subjecting all foreign vessels that should be taken with such on board to confiscation; and proclaimed in blockade the more than 4000 miles of Brazilian coast. The Brazilians had hitherto recognised the authority of the king, but resisted firmly the decrees of the cortes, and denied the competency of their authority.

* The word *assembly* was adopted from the French, to avoid using the word *cortes*, which had become odious to the Brazilians.

A manifesto dated August 1, 1822, was proclaimed by the prince regent, in which he appealed to the Brazilians and accused the cortes of Portugal with having destroyed all the established laws and institutions of the monarchy.

"Brazilians, the time for deceiving mankind is past. The governments which would found their power on the pretended ignorance of the people, or on old errors and obsolete abuses, will see the colossus of their greatness fall from the fragile basis on which it was once erected. It has been owing to their not recognising this truth that the cortes of Lisbon have compelled the southern provinces of Brazil to shake off their yoke. It is because I have respected it, that I now see all Brazil united round me, asking for the defence of their rights, and the maintenance of their liberty and independence. Under these circumstances, *I owe it to you to speak the truth.* Hear me."

"Portugal," he proclaimed, "cannot compel us to follow her in this system of shame and degradation, without violating the very principles on which she founds her own revolution and her right of changing her political institutions—without destroying the bases on which are built her new rights, the inalienable rights of the people."

He complimented the southern provinces of Brazil for having withstood alike the republican desires and dispositions which had manifested themselves in some quarters, and the seductive examples of some neighbouring nations. "It is they," he said, "who have preserved the monarchy in the great American continent, and maintained inviolate the acknowledged rights of the august house of Braganza."

A manifesto addressed to foreign nations, dated the 6th of August, contained the formal declaration of the independence of Brazil.* The prince regent in this manifesto detailed the tyrannical measures of the cortes, and the duration and bondage under which his august father was held by the dominant faction; and he solemnly protested that he still looked forward to the reunion of all the parts of the monarchy under one sole sovereign; with which reserve only he swore to defend the legitimate rights, and the constitution to be adopted for Brazil.

The municipal senate of Rio Janeiro, at an extraordinary sitting, held the 7th of September, came to the resolution of issuing a circular address to all the municipal senates of Brazil, urging the necessity of investing his royal highness the prince regent and perpetual protector of Brazil, as soon as possible, with the official exercise of all the attributes of the executive. This circular was privately issued, and favourable answers to it were received from the provinces of Minas Geraes and Saint Paulo, and from the captaincy of Espirito Santo. Fresh despatches reiterating folly and threats arrived from Lisbon. The senate at Rio, to calm the public impatience, announced by an edict on the 21st of September, that the proclamation of the prince as constitutional emperor, should be made with due solemnity on the 12th of the ensuing month. This promise was fulfilled on that day, in the provinces of Rio Janeiro, Minas, Saint

* In this manifesto it was distinctly stated, that Portugal had offered to cede to France a part of the province of Para, on condition that that power should furnish troops and transports for the reduction of Brazil; and that proposals had been made to England, with the same views, to give perpetuity to the commercial treaty of 1810, and even to extend it by additional advantages.

Paulo, and Espiritu Santo: and, at Villa Rica and Queluz on the 30th of September. On the 1st of December, the coronation of Pedro I., Emperor of Brazil, was solemnised, and he took the oath to defend with his sword the country, the people, and the constitution, *if* it should be worthy of Brazil and of its sovereign. On taking the imperial dignity he did not demand, nor obtain, any increase either of revenue or of power. In his speech on opening the constituent assembly on the 3rd of May, 1823, he declared that the title conferred on him on the 13th of May preceding, of perpetual protector of Brazil, was still more flattering to his heart than that of emperor.

His first act was to summon a constituent and legislative assembly, which was to meet first at Rio Janeiro, on the 26th of February; but postponed to the 3rd of May, the anniversary of the discovery of Brazil by Cabral.

The citizens of Rio Janeiro, in manifestation of their loyalty, spontaneously voted the annual sum of 400,000 francs towards the increase and support of the Brazilian navy. Bahia, meantime, was surrounded by 20,000 Brazilian troops, chiefly volunteers, under the command of Jose Joaquim da Silva Lima. In the end of June, at a council of war, it was decided by the officers of the Portuguese army to abandon the city, and escape, if possible, by sea. Accordingly the gold and silver of the churches, and the chest with public money, were carried off; and Bahia was, in fact, pillaged by the Portuguese troops, which then embarked, and the squadron, together with all the other Portuguese vessels in the harbour, which were laden with troops and passengers, prepared to sail on the night of the 2nd of July. The bar of Bahia was blockaded, however, by the squadron of Rio Janeiro, consisting of sixty sail, under the command of Lord Cochrane. The Portuguese fleet consisted of eighty sail, including twenty men-of-war. General Madeira embarked on board the *Don Joam VI.* with the gold, silver, and other precious valuables. A favourable wind and the extreme width of the bay, enabled the Portuguese to escape; but Lord Cochrane sailed in pursuit, overtook part of the armament between Bahia and Pernambuco, and captured several vessels. General Sylva da Lima entered Bahia on the 2nd of July, and proclaimed the imperial government. Para, and St. Louis in Maranham, surrendered to Lord Cochrane on the 28th of August, for which he was created by the emperor, Marquis of Maranham.

The conduct of Lord Cochrane on his second voyage to Maranham is not to be throughout justified; but we must admit that his services were great, and the ingratitude and injustice of the Brazilian government cannot be defended.*

* Mr. Kidder, speaking of Lord Cochrane's last expedition, observes,—“Having, then, re-established order throughout the province, and appointed to the presidency Manoel Telles da Silva Lobo, an individual entirely in his own interests, Lord Cochrane proceeded to carry into execution a plan which he seems to have formed long before. Notwithstanding the services which he had already rendered to Brazil, and the acknowledgment of them in the title of Marquis of Maranham, conferred upon him by the emperor, he had hitherto received neither payment for

On the 30th of June, the emperor fell from his horse, which broke some of his ribs. The democratic party had now become factious during Don Pedro's indisposition from the above accident. They sent both to him and to the Prime Minister threatening letters, purporting that if the latter did not resign, his life, and even that of the emperor, would not be safe. This attempt to succeed at intimidation utterly failed; but the democrats had gained strength in the assembly, and on the 29th of July, when the question of the absolute *veto* was discussed, without which the royal prerogative would have been a nullity, the democrats obtained a majority. The emperor, in consequence, declared, "that he would never put in execution any acts which had not obtained his express sanction." The assembly still determined to carry their point. On the 9th of

his services nor reimbursement for his expenses. He therefore looked upon the admission of his claims on the imperial government as hopeless, and determined to seize the present opportunity of indemnifying himself whilst it was yet in his power. In doing this he had nothing to apprehend from the president. Under the plea, therefore, that the ordnance, military stores, ammunition, and all the various fixtures formerly appertaining to the Portuguese government, were in reality the lawful prize of their captors, he proceeded to make an estimate of their value, which was found to amount to nearly 400 contos of reis. This amount, however, and also the sixty contos formerly furnished to the army of Piahy, his lordship, in consideration of the impoverished state of the province, agreed to commute for about the fourth part, or 106 contos, provided the latter sum were paid immediately. His lordship appeared in person at a meeting held by this body (the treasury board), and after adducing his estimates, proceeded to urge the claims of the squadron with great firmness. A unanimous vote was finally passed, that as the treasury was nearly empty, the custom-house should furnish the stipulated sum, and an order was given on the latter establishment for the amount.

"This order was to be discharged by successive instalments. The money came round but slowly, and the designs of his lordship were again subjected to a far more serious obstacle, in the arrival of another president (Barros) from Rio de Janeiro. The newly-appointed functionary arrived at his destination early in February, when he was received with all due honours by the actual president as well as by Lord Cochrane. Finding the province in a state of peace, he was anxious to ascertain the particulars of the late convulsions, and the actual state of political parties before he entered upon his official duties. No sooner, however, had he been made aware of the late proceedings of Lord Cochrane, than he intimated to his lordship his intention to assume office in the course of a few days. To this sudden resolution his lordship as suddenly refused to accede. It had become evident that Barros was an individual of a much less complying disposition than the Lobo, the actual president, and as the payment of the stipulated 106 contos was still incomplete, his lordship took occasion to postpone the fulfilment of Barros' intention, under the plea that he had already written to Rio de Janeiro regarding political affairs, and that as he expected an answer within ten days, he deemed it most advisable to retain Lobo in office until the expiration of that time. Barros immediately threw off the mask, and telling Lord Cochrane that he fully comprehended the motives of this treatment, threatened to make his lordship responsible for it to the emperor.

"Barros had, however, in connexion with a number of partisans, determined on a forcible attempt to invest himself with the presidency, to be executed on the 10th of March, 1825. Of this Lord Cochrane received intelligence in an anonymous communication, and after disembarking a force from his line-of-battle ship, he proceeded to arrest Barros as a conspirator, and on the 12th sent him off a prisoner in the brig of war *Cacique* to Para, there to await the determination of the emperor.

"Having at length received the stipulated sum from the custom-house, as well as fifteen contos in ransom for a slave vessel claimed as a prize on the first surrender of Maranhão, and still retained there, his lordship finally sailed for England in the *Piranga*, on the 20th of May. He had already placed Commodore Jewett in the *Pedro Primeiro*, and despatched that vessel to Bahia, whither he gave it out to be his intention to follow her. He, nevertheless, proceeded directly to Portsmouth, where he arrived after a passage of thirty-seven days. His engagement had been to serve Brazil until the recognition of her independence by Portugal, and till this event took place he kept his flag flying on board the *Piranga*, though there was but little probability that his services would ever again be desired by Brazil after the course he had taken."

August, the emperor issued a proclamation, declaring his abhorrence of all despotism, whether that of one or of many.* The royalists certainly found a majority in the empire, and Dom Pedro was supported by the army, the fleet, the marine regiments, and a large majority of Brazilians.

The ministry was in November changed. Some members of the assembly brought forward several charges against the new ministers. The sitting of the 11th of November was tumultuous. The emperor, in order to give confidence in the freedom of discussion to the assembly, withdrew the troops from the city. Anarchy, however, was declared to have attained so dangerous an ascendancy, that the government ordered 400 cavalry and infantry, with four pieces of artillery, to surround the assembly, and dissolve its sitting by force. Six or eight deputies were arrested. Dom Pedro rode through the city, and was received with general acclamations. All the houses were illuminated, and tranquillity was re-established. A proclamation was immediately published, by which the emperor promised to give the nation "a constitution that should be worthy of himself and the people of Brazil."

A legislative assembly (not constituent) was summoned by a decree of the 17th of November. In the meantime, the draft of a constitution, framed by a special commission, and approved by the emperor, was circulated throughout the empire. In the north of Brazil fresh troubles broke out. The inhabitants of the province of Pernambuco, always the bravest since the time their ancestors expelled the Dutch, became discontented with the government of Dom Pedro. It was seriously planned by many of them to erect a separate republican government, with a spirited and intelligent young man, Manoel Carvalho Paes, as president. The port, however, was blockaded by the emperor's vessels on the 20th of March, 1824, and Carvalho was arrested and imprisoned in Fort Brum. The garrison of that fort, however, with the other troops, revolted, and released him.

In a few hours Carvalho was reinstated in the presidency, and the president appointed by the emperor was not allowed to assume his functions.

Carvalho's administration for some time assumed the semblance of an integral part of the imperial government. But having equipped a small naval force, it in reality only deferred to a better opportunity the execution of its revolutionary plan. An imperial manifesto was received, stating that as a squadron was now fitting out in the Tagus for the invasion of Brazil, that the

* This proclamation states—"Believe, then, neither those who flatter the people, nor those who flatter the monarch. Both are actuated only by selfish motives, and under the mask whether of liberalism or of servilism, wish only to advance their own interests on the ruins of their country. The times in which we live, are full of sad examples. Let what has befallen foreign countries serve you as a lesson. Brazilians, confide in your emperor and perpetual protector. He desires no power that does not belong to him, but he will not suffer that to be usurped which is his right, and which is indispensable to enable him to secure your welfare. Let us await the constitution of the empire, and hope that it may be worthy of us. May the supreme Arbiter of the universe grant us union and tranquillity, strength and perseverance, and the great work of our liberty and our independence will be accomplished."

emperor was unable to guard the whole coast, and that it was expected that the Pernambucans would be able to defend themselves.

Carvalho and his partisans seized on this opportunity for carrying into effect their plan of independence. Proclamations were, therefore, published, denouncing Dom Pedro as a traitor, whose intention it was to abandon Brazil to the Portuguese, and the provinces of the north were requested to withdraw from the authority of the imperial government, and to combine under a republic, to be called the "Confederation of the Equator." A great number of the inhabitants of Parahiba, Rio Grande do Norte, and Ceará, declared in favour of this rebellion, but the movement was not general.

Barretto, an extensive landed proprietor, afterwards created Marquis de Recife, took up arms in the cause of the emperor; and he was joined by some imperial troops and partisans. Carvalho besieged the imperialists by land, and, at the same time, with a small naval force blockaded them by sea, but without any decisive success.

Intelligence of this revolt reached Rio de Janeiro. The "habeas corpus law" was suspended throughout Pernambuco. A squadron was fitted out under Lord Cochrane, carrying a division of 1200 men, commanded by General Francisco de Lima. The soldiers were landed at Maceió, in order to co-operate with those of Barretto, while Cochrane sailed to blockade the city. He issued proclamations, "stating his persuasion that the dissensions now agitating Pernambuco had their origin in erroneous impressions regarding the events which had taken place at Rio de Janeiro, and he volunteered to act as a mediator between the insurgents and the emperor. He recalled to their attention the distracted state of the Spanish republics throughout South America, and he finally threatened to increase the rigour of the blockade; to destroy their shipping, and, by sinking vessels in the mouth of the harbour, to block up all entrance into the port, unless the integrity of the empire were again acknowledged within eight days from the date of his first proclamation."*

Lord Cochrane then prepared to bombard the city, and the inhabitants began to withdraw to the interior, with their slaves and moveable property. A schooner commenced throwing shells into the Recife about midnight, on the 28th of August, but with so little effect that she was soon withdrawn. Larger vessels

* "This threat failing entirely of its object, Lord Cochrane availed himself of the services of Mrs. Graham, known as the authoress of the 'Journal of a Voyage to Brazil,' who happened to arrive opportunely as a passenger in the English packet from Falmouth. This lady accepted the office of endeavouring to arrange an interview between Cochrane and Carvalho, on board a French brig of war. Carvalho replied to the overtures by offering the admiral 400,000 milreis, in case he would abandon the imperial cause, and come over to the republicans. It was now time for an indignant refusal, and all farther negotiations were broken off."—*Kidder's Brazil*.

could not approach near the shore. At the same time, the rocky bottom of the *Lameirão* cut the cables, and all the anchors but one, of the admiral's ship, were lost; and he was consequently forced to abandon the blockade.

The troops of General Lima, meantime, joined those of Barretto; and the more numerous, but undisciplined, forces of the republicans were finally vanquished, on the 11th of September. Carvalho fled for refuge on board the British corvette *Tweed*, and absented himself until after the departure of Dom Pedro from Brazil. He is now, or was lately, a senator of the empire.

On the 24th of March, 1824, the suffrages of the provinces having been collected, the emperor took the oath before the people, to observe the charter which he had just granted, and which is now to be considered as the fundamental and definitive law of the new empire. This constitution was sworn to throughout the empire. Two years afterwards 2400 Irish, and a great number of Germans, were inveigled into Brazil, and treated as barbarously as if they were slaves, until the British Chargé d'Affaires, Mr. Aston, had them all, but about 400, sent out of the country.

The imperial rule of Dom Pedro I. lasted for about ten years; and, during this period, Brazil advanced far more in intelligence, than it had done during the three centuries, which had passed away from its first discovery, to the proclamation of the Portuguese constitution in 1820. His administration was not, however, free from imperfections.

Mr. Kidder says of him—

“Dom Pedro, although not tyrannical, was imprudent. He was energetic, but inconstant—an admirer of the representative form of government, but hesitating in its practical enforcement.

“Elevated into a hero during the struggle for independence, he appears to have been guided rather by the example of other potentates than by any mature consideration of the existing state and exigencies of Brazil; and hence, perhaps, the eagerness with which he embarked in the war against Montevideo, which certainly had its origin in aggression, and which, after crippling the commerce, checking the prosperity, and exhausting the finances of the empire, ended only in the full and unrestrained cession of the province in dispute.”

The habits of the emperor are also considered to have been extravagant, and his morals defective; and the chief cause of his personal unpopularity is said to have been, his never having considered, or comported, himself truly a Brazilian.

He often said, “that the only true strength of a government lay in public opinion;” yet he seems not to have understood how to conciliate the good opinion of the people over whom he reigned.

“The native Brazilians believed that they were beheld with suspicion, and hence became restive under a government which they regarded as nurturing foreign interests and a foreign party. At length, after fruitless efforts to suppress the rising spirit of rebellion in different parts of the empire, Dom Pedro found himself in circumstances as painful and as humiliating as those which forced his father, Don John VI., to retire to Por-

tugal. Opposition, which had long been covert, became undisguised and relentless. The most indifferent acts of the emperor were distorted to his prejudice, and all the irregularities of his private life were brought before the public. Individuals to whom he had been a benefactor deserted him, and perceiving that his star was on the wane, had the baseness to contribute to his overthrow. The very army which he had raised at an immense sacrifice, which he had maintained to the great prejudice of his popularity, and on which he had unfortunately placed more reliance than upon the people, betrayed him." —*Kidder*.

After various popular agitations, which increased the jealousies and differences between the imperial party, and that, which called its members, the patriots, the populace of Rio de Janeiro assembled in the Campo de Santa Anna on the 6th of April, 1831, and demanded the dismissal of the new ministry, and the reinstatement of some individuals who had that very morning been dismissed. Dom Pedro issued a proclamation, signed by himself and the existing ministry, assuring the people that the administration was perfectly constitutional, and that its members would be governed by constitutional principles. A magistrate was sent to read this document to the people; which he had scarcely finished, before it was torn from him and trampled under foot. The demand for the reinstatement of the cabinet became uproarious; the multitude rapidly increased its numbers; and, about six o'clock in the afternoon, three justices of peace were dispatched to the imperial residence to demand that the "ministry who had the confidence of the people" should be called to office.

The emperor refused. "I will do every thing for the people," he said, "but nothing by the people."

This answer being transmitted to the Campo, seditious cries were raised, and the troops began to make common cause with the multitude. The emperor declared he would rather suffer death than agree to this popular dictation. His power was, however, now at an end. The battalion styled the emperor's, quartered at Boa Vista, went to join the people in the Campo. The imperial guard of honour, which had been summoned to the palace, followed; and the populace supplied themselves with arms from the adjoining barracks.

"The emperor," says Mr. Kidder, "in these trying moments, is said to have evinced a dignity and a magnanimity unknown in the days of his prosperity. On the one hand, the empress was weeping bitterly, and apprehending the most fatal consequences; on the other, an envoy from the combined assemblage of the troops and populace was urging him to a final answer. Deserted, harassed, irritated, and fatigued beyond measure, he at length found it necessary to yield to circumstances."

He, without even informing the ministry of his resolution, at two o'clock in the morning, wrote his abdication in the following words:—

"Availing myself of the right which the constitution concedes to me, I declare that I have voluntarily abdicated in favour of my dearly beloved and esteemed son, Dom Pedro de Alcantara.

"Boa Vista, 7th of April, 1831, tenth Year of the Independence of the Empire."

He then rose, and addressing himself to the messenger from the Campo, said—"Here is my abdication; may you be happy! I shall retire to Europe,

and leave the country that I have loved dearly and that I still love." In tears he retired to an adjoining room, in which were the empress and the English and French ministers. He afterwards dismissed all his ministers but one, and by a decree dated the 6th of April, nominated Jozé Bonifacio de Andrada guardian to his children.

Mr. Kidder remarks on this filial act :—"It was a striking illustration of the ingratitude with which he was treated in the hour of misfortune, that from all those upon whom he had conferred titles and riches; he was obliged to turn away to the infirm old man whom, at a former period, he had rejected and cruelly wronged."

After arranging his household affairs, he embarked in one of the boats of the English line-of-battle ship the *Warspite*, accompanied by the empress, and his eldest daughter, the present Queen of Portugal.

The instrument of abdication was received in the Campo de Santa Anna with demonstrations of joy, and with vivas to Dom Pedro II.

Early in the morning, all the deputies and senators in the capital, together with the ex-ministers of state, met in the senate house and appointed a provisional regency, consisting of Vergueiro, Francisco de Lima, and the Marquis de Caravellas, to administer the government until the appointment of a permanent regency provided for by the constitution. The son of Dom Pedro, in favour of whom the emperor abdicated, was not six years old; he was, however, borne in triumph to the city, and the ceremony of his acclamation as emperor was performed with great enthusiasm. Meantime the *corps diplomatique* assembled at the residence of the pope's nuncio. The American chargé d'affaires declined being present at this meeting, apprehending that its object was to protect the common interests of royalty. The other foreign members agreed to present an address to the existing authorities, in which they stated that the safety of their several countrymen was endangered in the popular movements, and demanded for them the most explicit enjoyment of the rights and immunities conceded by the laws and treaties of civilised nations.

The 9th of April was appointed as the first court day of Dom Pedro II., while the ex-emperor still remained in the harbour. A Te Deum was chanted in the imperial chapel. The troops were reviewed, and an immense concourse of people, distinguished by the "avore nacional," as a badge of loyalty, crowded the squares and other public places. They detached the horses from the imperial carriage, and drew the infant sovereign to the palace; where he was exhibited at the window, and the multitude passed before him. He there received the personal compliments of the *corps diplomatique*, none of whom were absent.

The provisional government offered Dom Pedro a national ship. He declined the offer on account of the delay that would be necessary in the outfit.

On the 13th, the English corvette *Volage*, and the French corvette *La Seine*, put to sea, the former bearing the ex-emperor and empress, and the latter his sister and her husband.

The return of Dom Pedro to Portugal, and his subsequent fortunes, do not belong to Brazil.

On the 17th of June, the *Assembléa Geral* proceeded to the election of the permanent regency. The persons elected were Lima, Costa Carvalho, and Joao Braulio Muniz.

Senhor Antonio Carlos de Andrada presided in the Chamber of Deputies. Jozé Bonifacio, who had been appointed by the ex-emperor as tutor to his children was confirmed, or rather re-appointed, by the "Assembléa;" as that body decided that the former appointment was invalid. On accepting his charge that distinguished Brazilian declared that he should receive no compensation for the services he might render in that important capacity, which declaration he maintained in the spirit of a true patriot.

The public tranquillity was scarcely at all disturbed. Some disorders were committed by the troops on two different occasions, but with no political object.

On the 7th of October official despatches arrived, bringing congratulations, to Brazil from the government of the United States, upon the changes effected by a bloodless revolution.

On the 3rd of April, 1832, there was a revolt of the troops in the forts of Santa Cruz and Villegagnon. One hundred of those landed at Bota Fogo and marched to the Campo da Honra, but they were soon dispersed. A few days after about 300 persons disturbed the public peace at St. Christopher's, but were also routed by the national guards, thirteen of the insurgents were killed.

In July following, the minister of justice in his relatorio (report), denounced the aged Jozé Bonifacio, suspecting him of having connived at the riots. The committee of the "*Camara dos Deputados*" demanded his dismissal without allowing him to make any defence. The *Camara*, by a bare majority, acceded to this iniquitous demand, but the senate dissented, and this plot failed. The regents then sent in their resignation to the general assembly. A deputation from the chamber of deputies was sent to request them to retain office. They consented, but they immediately organised a new ministry.

In 1833, it was communicated by the minister of state to the general assembly that there was an apprehension that Dom Pedro I. was desirous of his restoration, in Brazil. The ex-emperor never attempted any design for his restoration but he sent to Brazil for his carriages, which had been left behind for the use of his children, and also for the jewels that had formerly belonged to his deceased daughter Paula.

The Marquis de Itanhaen replaced Jozé Bonifacio as tutor to the imperial children.

During the year 1834, important changes were made in the constitution of the empire. Annual assemblies in the provinces instead of the general councils before held were established. The members of the provincial assemblies were to be elected once in two years. Another law abolished the triple regency, and conferred that office upon a single person, to be elected once in four years. The former arrangement originated in a jealousy of one personal executive power; but the triumvirate had actually settled in one man, by the sickness, imbecility, and at last the death of Braulio, one of the regents, and the absence of Carvalho, the other. Francisco de Lima exercised in person the imperial power.

After the election for sole regent took place, the senate delayed for a long time the *apuracao*, or scrutiny of votes, under pretence that all the votes had not yet been had. They even proposed that the "*Camara dos Deputados*" should unite with the senate for the election of a regent, on the old system, in place of the deceased Braulio. This proposal was acceded to, "on condition that the senate should decide that the counting of the votes was impracticable."

The senate declined this responsibility, and agreed to form a convention for the scrutiny. It then appeared that Diogo Antonio Feijo, of San Paulo, was chosen by a majority of 575 electoral votes over Hollanda Cavalcanti of Pernambuco. Feijo was a priest: previous to the scrutiny he had been for many years engaged in political life, and two years had been elected a senator. One of the last acts of the preceding administration had been to elect him Bishop of Mariana, a diocese which included the rich province of Minas Geraes. Feijo was installed sole regent on the 12th of October, 1835. On the 24th he issued a proclamation to the Brazilians, declaring the principles upon which he resolved to govern. During the year an insurrection was suppressed at Pernambuco.

In 1836 the government proposed to employ Moravian missionaries to catechise the Indians. This, together with every other measure originated by the administration, was opposed by Vasconcellos, an old politician of much ability, but of unscrupulous principles. The leading measure of the administration was however, carried. This was a loan of 2000 contos of reis. Numerous active rebellions broke out in Rio Grande do Sul, and also in Para.* At the latter the

* Para had often been a scene of revolt, and some atrocious scenes were executed there after it had ceded on a deception practised by Captain Grenfell, one of Lord Cochrane's officers, Mr. Kidder says, after putting down the revolt, and returning on board, "he received, the same evening, an order from the president of the junta, to prepare a vessel large enough to hold 200 prisoners. A ship of 600 tons burden was accordingly selected. It afterwards appeared, that the number of prisoners actually sent on board by the president was 253. These men, in the absence of Captain Grenfell, were forced into the hold of the prison-ship, and placed under a guard of fifteen Brazilian soldiers.

"Crowded until almost unable to breathe, and suffering alike from heat and thirst, the poor wretches attempted to force their way on deck, but were repulsed by the guard, who, after firing upon them and fastening down the hatchway, threw a piece of ordnance across it, and effectually

president was assassinated, and the Portuguese were indiscriminately murdered. Their most atrocious and desolating effects, were, however, scarcely apparent at the capital, where every thing seemed quiet and prosperous. The general assembly was slow in making provision to suppress these revolts, and when they were about to adjourn, Feijo prolonged the session a month, "that the members might do their duty."

Feijo's administration was not popular. His character partook of the Roman sternness. Whatever course he planned, he pursued it without fearing opposition. He sometimes changed his ministers, seldom his advisers. At length the rebellion of Rio Grande, and the factious opposition that checked his plans for suppressing the revolt, induced him on the 17th of September, 1837, to abdicate the regency. The opposition party then came into power. Vasconcellos was the prime mover, but Pedro Araujo Lima, then minister of the empire, assumed the regency by virtue of a provision of the constitution. "A new policy," says Mr. Kidder, "was adopted towards the boy emperor. Feijo had been reserved and unceremonious; the new administration became over-attentive. More display was made on public occasions, and the inclinations of a people, passionately fond of the pomp and circumstance of royalty, began to be fully gratified."

In October, 1838, the new electoral votes were sanctioned, and Lima was installed regent for a period extending to the majority of the young emperor. Soon after, the latter, and not the regent, received all courtly flatteries.

The regency had throughout to struggle with difficulties, but many improvements were made under its administration.

CHAPTER III.

DOM PEDRO II.

THE contending parties became wearied of the regency, and dissensions arose as to the period of declaring the emperor of age,—and for the purpose of overthrowing the regent. In the debate upon the motion, a proposition was in-

debarred all egress. Suffocation, with all its agonies, succeeded. The aged and the young, the strong and feeble, the assailant and his antagonist, all sank down exhausted and in the agonies of death. Of all the 253, four only were found alive, who had escaped destruction by concealing themselves behind a water-butt."—*Armitage*, vol. ii. p. 108.

"This dreadful scene is, perhaps, unparalleled in history. It has but too much affinity with the treatment of the prisoners taken and confined at the same place, in the subsequent civil revolutions. Vast numbers of these unhappy men were crowded into the prison of the city and of the fort, where they were kept, without hope of release, until death set them free. Besides, a prison-ship, still moored in front of the town, called the *Xin Xin*, was filled to its utmost capacity. I heard it estimated that not less than 300 had died on board this one vessel in the course of the last five or six years."—*Kidder*.

troduced early in July, in the house of deputies, to declare the emperor of age. Objections were at first advanced, by those who contended that the legislature had no power to amend or overstep the constitution. Mr. Kidder affords the only report we have on this crisis. He says;—

“But the plan was arranged, minds were heated, and the passions of the people began to be enlisted. Violence of language prevailed, and personal violence began to be threatened. Antonio Carlos de Andrada, already described as a man of great learning and eloquence, but at the same time fiery and uncontrollable, stood forth as the champion of the assailing party, accusing the regent and his ministry of usurpation, especially since the 11th of March, when the imperial princess, Donna Januaria, became of age. His efforts were powerfully resisted, but his cause rapidly gained favour both in the assembly and among the people.

“Galvao, until recently attached to the other party, made an impressive speech on the side of immediate acclamation as inevitable.

“Alvares Machado demanded that party trammels should now be abandoned. ‘The cause of the emperor was the cause of the nation, and ought to receive the approbation of every lover of the country.’

“Navarro, a young but powerful member from Matto Grosso, followed in a violent and denunciatory speech, in which he stigmatised the regent, and all his acts, in the most opprobrious language. While in the heat of his harangue, he suddenly exclaimed, *Viva a maioridade de sua majestade imperial!* The crowded galleries had hitherto observed the most religious silence, but this exclamation drew forth a burst of enthusiastic and prolonged applause. Navarro, no longer able to make himself heard, drew his handkerchief from his bosom to respond to the vivas from the gallery. Members of the other party sitting near him, imagined they saw a dagger gleaming in his hand, and not knowing whose turn might come first, began to flee for their lives. One seized Navarro to keep him quiet; but he, not perceiving the reason of the assault, furiously repelled it. For a few moments the most intense and uncontrollable excitement prevailed, but order was soon restored.

“Crowds of people now assembled out of doors, demanding the elevation of the young emperor. Some went so far as to proclaim his majority in the public squares of the city.

After much opposition to the measure, the committee was appointed, and a momentary calm ensued. During the night both parties reviewed their positions. The clubs and lodges held their sessions, and the opposition met *in caucus*. The regent and his ministry were also in conclave. Vasconcellos, who had long been obnoxious on account of great moral delinquencies, was called in as their counsellor.

“The session of the chamber of deputies next day was opened in the midst of the deepest anxiety.

“Navarro accused the majority of the committee of treacherously intending delay. He urged the immediate and unceremonious declaration of the emperor's majority. He appealed to the galleries, and received a deafening response of vivas to Dom Pedro II. Indescribable confusion ensued. The president of the chamber attempted to call up the order of the day, but it was impossible. The more moderate of the opposition wished the young emperor's elevation deferred till his birthday, the 2nd of December. The more violent exclaimed vehemently against any delay whatever. The debate was protracted to an unusual length. In the midst of it, a messenger entered bearing documents from the regent. They were read by the secretary. The first was a nomination of Bernardo Pereira de Vasconcellos as minister of the empire. At the mention of the name of Vasconcellos irrepressible sensations of indignation were apparent throughout the house. The secretary proceeded to read the second document, which proved to be an act of prorogation, adjourning the general assembly over from that moment to the 20th of November following.

“Confusion and indignation were now at their height. The people in the galleries

could not be restrained. They poured down a torrent of imprecations upon the administration, mingled with *vivas* to the majority of Dom Pedro II. Antonio Carlos, Martin Francisco, Limpo de Abrêo, sprang to their feet, and one after the other entered their vehement protests against this act of madness on the part of the government.

"The president of the house attempted to enforce the act of prorogation, but was prevented. Antonio Carlos now started forth, and called upon every Brazilian patriot to follow him to the halls of the senate. His friends in the house, and the people en masse, accompanied him. The multitude increased at every step. On the arrival of the deputies at the senate, the two houses instantly resolved themselves into joint session, and appointed a deputation, with Antonio Carlos at its head, to wait upon the emperor and obtain his consent to the acclamation. The multitude without had increased to the number of several thousand. No soldiers appeared, but the cadets of the military academy, in the heat of their juvenile enthusiasm, rushed to arms, and prepared to defend their sovereign.

"Presently the deputation returned, and announced that his majesty had consented to assume the reins of government, and had ordered the regent to revoke his obnoxious decrees, and to pronounce the chambers again in session. Thunders of applause followed this announcement. The enthusiasm of the people knew no bounds. The country was saved, and no blood was shed!

The Marquis of Paranaguá, president of the senate, declared that neither house was now in session, but that the members of both composed an august popular assemblage, personifying the nation, demanding that their emperor be considered no longer a minor. It was finally resolved to remain in permanent session until his majesty should appear and receive the oath prescribed by the constitution in their presence. The assembly consequently remained in the senate-house all night. A body of the national guards, the alumni of the military academy, and numerous citizens, also remained to guard them."

At daylight the people began to meet. By ten o'clock, eight or ten thousand of the most respectable citizens surrounded the palace of the senate. The president of the assembly then made a formal declaration of the objects of the convocation. In both houses the legal number, both of senators and of deputies, being present, the president arose and proclaimed—"I, as the organ of the representatives of this nation in general assembly convened, declare that his majesty, Dom Pedro II., is from this moment in his majority, and in the full exercise of his constitutional prerogatives. The majority of his majesty Senhor Dom Pedro II.! Viva Senhor Dom Pedro II., constitutional Emperor and perpetual defender of Brazil!! Viva Senhor Dom Pedro II!!!"

General *vivas* from the members of the assembly, from the spectators in the gallery, and from the multitude in the campo, rent the air. Deputations were appointed to wait upon the emperor, and to prepare a proclamation to all the people of Brazil. At half-past three o'clock the imperial escort appeared. His majesty preceded by the dignitaries of the palace, and followed by his sisters. His tutor occupied a place in the same carriage with himself. On the approach of the emperor the enthusiasm of the populace was uproarious. *Vivas* were roared forth from the campo during the whole ceremony. His majesty was received with courtly ceremonies and conducted to the throne, near which, the members of the diplomatic corps were seated in the uniform of their courts. The emperor knelt

down and received the oath prescribed by the constitution, whereupon was read aloud and solemnly signed, the following act, viz.:

"Know all men to whom this public instrument shall come, that on the 23rd day of July, in the year of our Lord 1840, and in the twenty-ninth year of the independence of the empire of Brazil, in this most loyal and heroic city of Rio de Janeiro, in the palace of the senate, and in the presence of both houses of the imperial legislature, to wit—thirty-three members of the senate, and eighty-four deputies, under the presidency of his Excellency the Marquis of Paranaguá, assembled in order to witness the fulfilment of the 103rd article of the constitution: being also present, his Imperial Majesty Senhor Don Pedro-de-Alcantara-Joao-Carlos-Leopoldo-Salvador-Bibiano-Francisco-Xavier-de-Paula-Leucadio-Miguel-Gabriel-Raphael Gonzaga, second emperor and perpetual defender of Brazil, the legitimate son and first heir of the late emperor, Dom Pedro I., and of the late empress, Donna Maria-Leopoldina-Josefa-Carolina, Archduchess of Austria. The most excellent president of this assembly having offered the emperor a missal, the latter laid his hand upon it, and recited in an audible voice the following constitutional oath:—"I swear to maintain the Roman Catholic Apostolic religion, and the integrity and indivisibility of the empire; to observe, and to cause to be observed, the constitution and the laws of the Brazilian nation, and to promote the general well being of Brazil by every means in my power." Wherefore, in perpetual memory of this event, duplicates of this document are signed and witnessed," &c. &c.

The following proclamation, was then approved by the assembly:—

"BRAZILIANS;—The General Legislative Assembly of Brazil, recognising that happy intellectual development with which it has pleased Divine Providence to endow his Imperial Majesty Dom Pedro II., recognising also, the inherent evils which attach themselves to an unsettled government; witnessing, moreover, the unanimous desire of the people of this capital, which it believes to be in perfect accordance with the desire of the whole empire, viz., to confer upon our august monarch the powers which the constitution secures to him; therefore, in view of such important considerations, this body has, for the well-being of the country, seen fit to declare the majority of Dom Pedro II., so that he may enter at once upon the full exercise of his powers as constitutional emperor and perpetual defender of Brazil. Our august monarch has just taken in our presence the solemn oath required by the constitution.

"Brazilians!—The hopes of the nation are converted into reality. A new era has dawned upon us. May it be one of uninterrupted union and prosperity. May we prove worthy of so great a blessing!"

After these ceremonies his majesty proceeded to the city palace, accompanied by the national guards, and the people in vast crowds. In the evening a brilliant cortejo took place, and the city was generally illuminated.

Such were the events of this remarkable and sudden revolution. The regency was abolished, tranquillity prevailed, and Dom Pedro II., at the age of fourteen and a half years, was invested with all the prerogatives of the imperial throne of one of the largest territorial and least populous empires of the earth.

On the 24th day of July, the following new ministry was organised:—

Department of the Empire—Antonio Carlos Ribeiro d'Andrada Machado; of Finance—Martin Francisco Ribeiro d'Andrada; of Foreign Affairs—Aureliano de Souza Oliveira Coutinho; of Justice—Antonio Paulino Limpo d'Abréo; of Marine—Antonio Francisco de Paula Hollanda Cavalcanti; of War—Francisco de Paula Cavalcanti d'Albuquerque.

On the 26th a *Te Deum* was celebrated in the imperial chapel, in commemo-

ration of the late events. It was followed by a levee at the palace, where the diplomatic corps complimented the emperor in the following address, delivered by the Baron de Rouen, minister of France, and senior member of that body.

“SENHOR :—The members of the diplomatic corps, accredited at this court, have the honour to present you the homage of their profound respect.

“It is with the deepest solicitude that they come, on this memorable day, to mingle their congratulations with those of your own subjects that have already been presented before your throne, and to express, in behalf of the sovereigns and the governments which they have the honour respectively to represent, those desires which they will never cease to cherish for the glory of your reign, for the happiness of your august family, and for the prosperity of Brazil.”

Congratulations in similar terms became the order of the day. Every society, each institution, every province, and nearly each town from the capital to the bounds of the empire, hastened to celebrate the event with extravagant rejoicing, and to send a deputation to the emperor, with “their most profound sentiments of joy at his elevation to the sovereignty, and their cherished hopes of his prosperity and happiness.”*

* As specimens of the style and sentiments used on these occasions, and as characteristic of the formalities and education of the Brazilians, the reader is presented with two translations. The first is the official address of the senate, presented to his majesty by a special deputation on the 28th of July.

“SENHOR :—The senate, impelled by the most elevated patriotism, transported with the most sincere pleasure, in view of the favour which your imperial majesty has just condescended to confer upon the empire, by entering at once upon the full exercise of your inalienable rights, has sent us in solemn deputation to congratulate your imperial majesty upon the memorable event which fills your majesty’s subjects with confidence and delight.

“If Brazil has received from your renowned ancestors, since the days of King Dom Manoel, benefits, which, progressively increasing up to the time when the cry of independence was first uttered at Ypiranga by the hero of both the Old and the New Worlds, enabled her at length to become a free nation, much stronger hopes of future glory do the Brazilians discover, in the patriotism of your imperial majesty.

“Divine Providence has endowed you with a great and magnanimous heart ; and in his eternal wisdom has destined you to rule over the empire of Santa Cruz. He, for our greater good, has in a wonderful manner overruled the late unlooked-for events, so as to bring your majesty before your subjects like a brilliant sun emerging from portentous clouds, and causing unmingled happiness.

“May the government of your imperial majesty serve as a polar star, to illumine all America, and to guide the inhabitants of this great continent in the path of order and of true glory ! Deign, therefore, to receive kindly the sincere well-wishes of the senate—they are those of the nation itself. Heaven grant, that the precious days of your imperial majesty may run on through many and happy years, so that national liberty may be maintained, and the true prosperity of the empire may be established.”

To this panegyric, his majesty replied :—

“I am very grateful for the sentiments which the senate expresses in view of my having assumed the exercise of my constitutional prerogatives.

“Gentlemen, you may assure the senate, that I shall endeavour to satisfy the desires of the nation, by maintaining a harmony between ourselves and foreign powers, by sustaining the constitution and laws of the empire, and by promoting the happiness of the nation.”

In the course of a month a steam-vessel carried to Pará the news of this revolution, and the accession of the emperor. The provincial assembly was then in session. A *Te Deum* was celebrated immediately, and an orator appointed, who recited a pompous discourse. The address was as follows :—

“Illustrious deputies !—The imperial court has just been the theatre of an event of the most interesting and promising character for Brazil. The people, and their representatives, have given to the empire and to the world the most decisive testimony of their adhesion to the person and throne of his Majesty Dom Pedro II., as well as an extraordinary perception of the wisdom and virtues which eminently distinguish him.

“The elevation of his imperial majesty to the throne, is decreed by the unanimous declaration of the people and their most worthy representatives. The fame of this glorious event has

Party feelings did not cease with the minority of the emperor. For a time it slumbered. A popular revolution afterwards, in 1842, almost destroyed the constitution—but the monarchical principle prevailed; and yet its success is attributed altogether to the passive obedience or indifference of the uneducated populace.

On the 29th of July, 1840, Senhor Antonio Carlos made a declaration of the policy and principles of the new administration. His speech on the subject was eulogised as one of the most able parliamentary efforts ever pronounced in Brazil. It summed up the leading principles upon which ministerial action would be based under the new order of things:—

“1. Simplicity in the plan of collecting, and economy in the disbursement, of the public revenues.

“2. Scrupulous respect to law literally constructed, and a total disregard of fanciful interpretations.

“3. Adhesion to existing institutions, and a cautious use of executive power.

“4. Energetic opposition to the rebellion of Rio Grande, but a disposition to listen to any overtures from the insurgents, that may be entertained with due respect to the national honour.

“5. Conciliation of opposing parties, without any wavering to accommodate either.

“6. Harmony of views and actions between the government and all its agents.

“7. All proper means to induce harmonious action in the two legislative bodies, but no resort to corruption or intrigue.

“8. Unanimity in the cabinet upon all questions of moment.”

“The nation,” says Mr. Kidder, “at large was perfectly exhilarated with the idea of the glorious revolution that had transpired; but the legislature, tired by its recent paroxysms, soon fell back into its old method of doing business. The first leading measure of the opposition was the appointment of a council of state, to hold the office of special advisers to the emperor. It became an immediate and protracted subject of discussion, but did not succeed till late in the following year. Things throughout the empire moved on in their ordinary course, save that, when the subject of the emperor’s elevation lost its novelty, that of his approaching coronation became the theme of universal interest and of unbounded anticipation.

“The early part of the year 1841 was fixed upon for the coronation. Preparations for that event were set on foot long in advance of the time. Expectants of honours and emoluments attempted to rival each other in parade and display. Extraordinary embassies were sent out from the different courts of Europe, in compliment to Brazil.”

Before the next session of the General Assembly, several of the provinces had resisted the new appointments of presidents, and in so doing had manifested tendencies to revolution. But the most serious difficulty was the long-existing rebellion in Rio Grande do Sul. To bring this internal war to a close, Alvares Machado was appointed an agent of the government to treat with the rebels. Great confidence had been reposed in his personal influence with Bento Goncalvez and others. But with all the facilities offered them, the insurgents refused to compromise. Machado was then appointed president of the province.

“In this office,” says Kidder, “instead of wielding a rod of iron, as his predecessors

resounded throughout the provinces of the empire, and we can now perceive the star of hope beaming brightly over us.

“Gentlemen, a most important era has occurred in the history of our nation; and as the proper organ of the people of Pará, let us employ our efforts to aid the emperor in the grand task of placing Brazil upon a level with the most enlightened nations of the world.”

had done, or had attempted to do, he adopted conciliatory measures, and rather entreated a negotiation. This attitude was stigmatised as dishonourable to the empire, and such an outcry was made about it, as to excite general alarm lest the interests of the throne should be betrayed. This outcry was aimed at the ministry. A change was demanded, and was at length obtained. On the 23rd of March the Andradas and their friends, with the single exception of Aureliano, were dismissed."

Araujo Vianna, a former tutor of the emperor, was now appointed the chief of the new cabinet, and the men who had brought about the new order of things, were supplanted "just in time for their opponents to secure the decorations and the emoluments that were soon to be distributed."

"Mortifying as this circumstance may have been in some of its bearings, it caused no grief to the Andradas in view of their personal wishes. They could point to the early days of their political prosperity, in proof of their disinterested devotion to their country. They could now, as then, retire in honourable poverty, preserving the boast of pure patriotism as a more precious treasure than wealth or titles. Theirs was the distinction that would cause posterity to inquire why they did not receive the honours they had deserved. Other men were welcome to the ignominy of wearing titles they had never merited."

Offices, orders, and honours, were sought for with servile and disgraceful meanness.

"It was thought politic," says Mr. Kidder, "to keep the applicants in suspense, especially those who were in the legislature. In the meantime, their votes might all be secured. The government could make sure of its loans and votes of credit. It could secure a pardon for past extravagances, and an amnesty for any it might choose to commit in future. Besides these controlling motives, there were others of quite a frivolous nature, that nevertheless had their weight. The imperial crown had been sent to England for alteration, and had not returned. One of the envoys-extraordinary that was expected had not arrived; and moreover, the harnesses for seven state carriages were as yet unprovided."

For two months longer than the time first mentioned, the coronation formed the all-engrossing topic of conversation and of preparation in every circle, from the emperor and princesses, down to the barefooted slaves. That event was at length celebrated on the 18th of July, 1841.*

There were circumstances connected with the pomp and expenditures of this coronation, which embarrassed those who had to manage the finances of the empire, then in a diminishing and almost bankrupt state. The money expended in the ceremony, including an expense of 100,000 dollars for an imperial crown, was borrowed, and added to an immense public debt.† The government was far from being stable. Its councils were divided—its policy vacillating.

* "It was magnificent beyond the expectations of the most sanguine. The splendour of the day itself—the unnumbered thousands of citizens and strangers that thronged the streets—the tasteful and costly decorations displayed in the public squares, and in front of private houses—the triumphal arches—the pealing salutes of music and of cannon—the perfect order and tranquillity that prevailed in the public processions and ceremonies of the day, together with nearly every thing else that could be imagined or wished, seemed to combine and make the occasion one of the most imposing that ever transpired in the New World. The act of consecration was performed in the imperial chapel, and was followed by a levee in the palace of the city. The illuminations at evening were of the most brilliant kind, and the festivities of the occasion were prolonged nine successive days."—*Kidder*.

† "It deserves mention here, that the honourable insignia of the coronation of Dom Pedro II, were not all confined to Brazilians. A general concession of orders and stars was made to each

After the coronation, the General Assembly resumed its sittings. On the 23rd of November, a law was passed, establishing the *Conselho de Estado*.

"This body was modelled upon the double basis of the ordinary and extraordinary privy council of Great Britain. Lima, Calmon, Carneiro Leão, and Vasconcellos, the very individuals who opposed the Andradas at the period of the young emperor's elevation, and who were then put down by acclamation, had, in the short space of a year, not only managed to get back into public favour, but also to secure life appointments of the most influential kind.

"Vasconcellos, it is true, sought for no titles. They were playthings which he could easily dispense with for the gratification of his fellow partisans. But he loved power, and neither mortifications nor defeat deterred him an instant from its pursuit. He finally gained a position which probably suited his inclinations better than any other, and in which, as the master spirit of the body, his influence must be widely felt."

The year 1842 was marked by disturbances in different parts of the empire. They commenced with the elections.

"Various frauds had been enacted, by suddenly changing the day, hour, and places of elections. What was worse, bodies of armed men were introduced to influence votes, while crowds of voters were brought in from other districts. In short, bribery, corruption, and force, triumphed over the free exercise of public opinion. It is not to be presumed that one party was guilty of these measures alone; but it appeared in the issue, that the opposition had succeeded, and that the ministerial party was in the minority. A change of administration would have been an immediate consequence of the regular opening of the session on the 3rd of May. This the ministry resolved to resist. They accordingly drew up solemn papers, advising the emperor to dissolve the chamber of deputies, urging, that on account of the illegality of the elections, it could not be a constitutional body. The preparatory session was held as usual, and proceeded in the reception of credentials, with no great scruple as to the manner in which they had been obtained."

His majesty was not allowed to open the regular session of the assembly. A decree was issued for a new election, and an extraordinary session, to commence on the 1st of January following. The members separated peaceably; but in May following rebellions appeared in parts of the empire, where they had scarcely ever been dreaded.

The causes or pretences for these revolts were the organisation of a council of state, and the changes which had been made adopted in the criminal code of the empire.

The first outbreak of actual rebellion was in the province of San Paulo. About the middle of May a movement was made at Sorocaba, in which Senhor Raphael Tobias was *acclaimed* president, in opposition to the Baron of Monte Alegre, his legitimate successor in office. Soon afterwards the rebellion was manifested in the province, north, south, and west of San Paulo. The general government at once endeavoured to repress these revolts. In the province of Minas Geraes the rebellion became formidable, first along the borders of the province of Rio de Janeiro, and then throughout the most populous settlements.

member of the diplomatic corps who took part in the ceremonies, and whose government allowed the acceptance of such distinctions. The individuals prohibited sharing in these honours by regulations of their own governments, were the British minister, and the representatives of the several American republics."—*Kidder*.

It was reported that within the city of Rio Janeiro, plans were concerted for a revolutionary movement. On the 17th of June a proclamation was posted up at the corners of the streets, "calling upon the people to free the emperor from the domination which had been imposed upon him, and to rescue both the throne and the constitution from threatened annihilation."

The militia was ordered out in arms, and martial law was proclaimed in the disturbed provinces. A proclamation signed by the emperor, declared that the supremacy of the laws must be maintained at all hazards, and calling upon the disaffected to lay down their arms. Several persons in the capital were arrested on suspicion, and many of them were banished without trial.

About the same time revolutionary movements took place at Pernambuco and Ceará. Order was at last restored without the loss of many lives. Public confidence was, however, enfeebled, and the imperial revenue underwent serious deterioration.

On the 1st of January, 1843, the emperor opened the general assembly in person, and the usual levee of New Year's Day, was made an occasion of uncommon splendour. Parties had also to a considerable degree assimilated.

It has been remarked, that "parties in Brazil are not true parties—they are factions, without definite system or object. Personal antipathies and predilections spoil all sound political concert on either side."

The administration had now, to a great extent, accomplished its purposes; but, notwithstanding, a new ministry was formed on the 20th of January. Aureliano, who had directed the department of foreign affairs, since the abolition of the regency, was displaced by Soares de Souza, the late minister of justice.

During the year 1843, the imperial marriages were celebrated with rejoicings and magnificence.

In July, 1842, Dom Pedro II. had ratified a contract of marriage with the Princess Senhora Donna Theresa Christina Maria, sister of the King of the Two Sicilies. The marriage was solemnised at Naples, and on the 5th of March a Brazilian frigate and two corvettes sailed from Rio de Janeiro to the Mediterranean, to bring the young empress to Brazil.

On the 27th of March, a French squadron arrived, under the command of Prince de Joinville of France. This prince had previously visited Brazil; and, soon after this second visit he made a proposal of marriage through the special mandate of the King of the French, to her Imperial Highness Donna Francisca. On the 1st of May the marriage was solemnised at Boa Vista. On the 13th of May the prince with his imperial bride sailed for Europe.

The empress, Donna Theresa, arrived at Rio Janeiro on the 3rd of September, after a pleasant voyage from Naples, and was received with splendid ceremonies and all expressions of cordiality on the part of the Brazilians.

On the 28th of April, 1844, her Imperial Highness Donna Januaria, was married to the Count of Aquilla, brother of the Empress of Brazil, and of the

King of the two Sicilies. Thus within a period of less than a year the imperial family of Brazil formed three alliances with the royal families of Europe.

A ministerial change occurred in the early part of 1844. The regular session of the legislative assembly commenced on the 3rd of May, and ended without any very remarkable circumstance. The same body was ordered to convene on the 1st of January, 1845. The elections, which took place preparatory to this extra session, were attended with serious disturbances in several of the provinces, particularly in Alagoas. The president of that province, *Senhor Franco*, who had presided formerly in Pará, was driven from the city of Maceió by the insurgents, and forced to embark on board a vessel of war that happened to be lying in the port.

There is no part of the habitable globe, which possesses a greater variety of, or more splendidly munificent resources than the empire of Brazil. An empire in its area as large as seventy-seven kingdoms of the same area as Portugal,—and nearly as extensive as all Europe. If we estimate its soil, climate, and water-courses, Brazil appears capable of being rendered, probably threefold, more productive than all the regions from the Atlantic to the Oural Mountains, from the Mediterranean to the Arctic Sea. This empire, however, does not possess in its population—which is little, if more in number than the inhabitants of Belgium, the power of becoming great, wealthy, and powerful, for a long period to come; unless every facility and security be afforded to the immigration of industrious Europeans, or of the citizens of the United States of North America;—unless the utmost security is guaranteed to person and property;—unless the prejudices against the persons and the religion of foreigners be forgotten;—unless the bigotted attachment of the Brazilians for hereditary customs, and for a make-shift system of agriculture, and handicraft trades, be supplanted by intelligence, industry, and enterprise;—and, unless the trade and navigation of every part, and port, of Brazil is relieved from restrictive commercial laws, and from high duties on commodities. Then, and not till then, can they advance in that progress of wealth, greatness, and power, of which they have so marvellous an example in Anglo-Saxon North America.

In the last book of this volume will be found more detailed descriptive sketches, and several statistic tables of this empire.

BOOK IV.

SPANISH AMERICAN REPUBLICS.

CHAPTER I.

SPANISH COLONIAL POLICY.

THE Republics of Mexico and of Central and of South America, exhibit in their political, moral, social, productive, and commercial condition, an extraordinary contrast to the progress and present state of the great Anglo-American Republic.

It was the misfortune of the former, to have been, previously to their independence, ruled, or rather awed into passive obedience, by the most darkening, monarchical and ecclesiastical, government: a government, and hierarchy that grew up, and acquired strength, during centuries of ignorance, tyranny, bigotry, and intolerance: under a government, and a church, that profited not by the march of modern civilisation, and religious liberty; but that enchained the freedom of written, and spoken language, and the expansion of the intellectual faculties.

The history of the Spanish colonies, is not celebrated by examples of that persevering, laborious, and enduring character,—animated, and cherished, and supported by the spirit, and the love, of civil and religious liberty, which so eminently distinguished the Pilgrim Fathers, the Quakers, and even the British Roman Catholics,—who first encountered and overcame all the privations, difficulties, and dangers of the American wilderness.

The character and conduct of the conquerors and colonists of Spanish America, and of their civil and ecclesiastical government ever afterwards, present a contrast, which, on becoming independent of Spanish authority, rendered the moral, intellectual, and even physical character of the people, and of those who were called upon to rule, incompatible with intelligent, tolerant government,—with impartial justice,—and with civil and religious liberty.

The colonial policy of Spain was selfish, intolerant, restrictive, and fallacious, from the foundation of the first settlement, in Hayti, until the expulsion of Spanish power from the continent of America.

This policy excluded all but Spaniards from those regions, and confined the trade to a direct intercourse with Spain. Agriculture was discouraged, in order

that Spain might possess the monopoly of supplying with food all the people of the vast territory conquered, by her adventurers, in the West. Spain proved haughty and intolerant; based her commercial and colonial system, on possessing and securing within herself all articles of necessity—all kinds of luxury—all the materials of wealth—all the elements of power. First, by prohibiting the entrance for home consumption of the products of any country, except those of her colonial empire; and secondly, by forcing the latter to consume no manufactured article, and none of food, except those exported from certain ports in Spain. This pernicious legislation was grounded on the specious policy,—that, as all the precious metals would necessarily be transported to the mother country, they would remain in Spain, if they were not required to pay for foreign commodities; that the precious metals constituted riches; and that wealth constituted power.

But in defiance of this fallacious policy, the gold, silver, and precious stones flowed off to foreign countries, both from the colonies and from Spain, nearly as rapidly as they were robbed from the natives of Hayti, Mexico, and Peru,—or drawn from the mines, by the millions of American and African slaves, who have been exterminated, under the cruel toils to which they were, by avarice and tyranny, doomed.

The effects which resulted from the Spanish conquests, in the islands, and on the continent of America, are remarkable. Into no country did such immense treasures flow as into Spain. In no country was there so little money to be found, either in circulation, or in the royal treasury. There was neither order nor economy in the finances of the government, nor in the expenditure of individuals. Money was borrowed at usury. Gold and silver, which the galleons brought annually to Cadiz from the New World, did not suffice to pay the debts which Spain owed in the Old. Agriculture, at home and in the colonies, was despised and neglected. Other branches of industry decayed, and several disappeared altogether. The Indies, instead of strengthening the power of Spain, rendered that monarchy gradually impotent in Europe. This poverty and weakness was chiefly caused by the genius of the Spanish policy. In order to retain conquests, the natives were exterminated. The spirit of government was tyranny,—the doctrine of the church was persecution,—the maxim of trade was monopoly. The long duration of those fallacies, rendered them, in Spanish wisdom, venerable. The Spaniards, believed the precious treasures of the New World exhaustless. They imagined their power invincible. Their ambition and pride measured no limits. The consequent wars in Europe, and the retention of the Indies, diminished the number of inhabitants,—and demoralised the remaining population. The country became exhausted, by its decreased powers of production at home, and by the plunder of its fleets by the enemy. The Spanish troops were ever brave,—yet they

were ill paid, badly fed, and wretchedly clothed. They were skilfully disciplined, and gallantly commanded,—but they were generally defeated. The people of the united provinces—a mere fragment of Spanish dominion, a marsh, a debris of river deposits, and sea sand, assumed and effected independence,—and constructed fleets, which swept those of their former tyrants from off the ocean. Spain, by insulting, roused and organised the power of other nations. Of England and France, Spain was especially jealous. England, and afterwards Holland, became her most formidable naval rivals. The precious metals of America enervated the Spaniards. The spirit of industry, trade, and navigation rendered the English and Dutch active, hardy, bold, and victorious.

The enterprising Anglo-Saxon colonists, who planted the New England and middle provinces of North America, were not slow in discovering profitable channels of commerce; and they soon commenced a very lucrative contraband trade with the Spanish settlements in Cuba, Mexico, and South America. It rapidly increased to a prodigious value and certain gain, by the interchange of all sorts of British manufactures for the precious metals and gems. These were nearly all remitted to England. A small part only was retained for a currency in the British plantations. The Spanish colonists gave all possible, illicit, encouragement to a commerce, which supplied them with the best articles, at half the price that were paid for those of the parent country. The Spanish colonial authorities contrived to share in the profits, and connived at a trade, which was undermining the whole commercial and colonial policy of Spain.

The Spanish monarchy, at length, to suppress this commerce, stationed a fleet of *guarda-costas* along the shores of Cuba, Porto-Rico, and the Gulf of Mexico. The indiscriminate seizure of all British vessels, met with near those coasts, was the chief cause of the war of 1734 between Great Britain and Spain.

After the war, the contraband trade with the Spanish settlements was resumed with activity by the Anglo-American colonists, until the English government agreed to assist Spain in effectually suppressing it. British war-cruisers were directed to seize, in order to be confiscated, all British merchant vessels found near the shores of the Spanish colonies. The avidity and severity of the commanders of these cruisers nearly destroyed the trade, and formed one of the great causes of discontent which led to the American revolution. After the independence of the United States, the contraband trade with the Spanish colonies was resumed, and continued with extraordinary activity and success, both from the continental ports of Anglo-America, and from the Bermudas, Bahamas, and other places, until the year 1809, when the Spanish West Indian and American ports were, by necessity, in consequence of the peninsular war, opened to foreign trade. But, while we are compelled to expose the pernicious effects of the colonial system acted upon by Spain, the unwise commercial policy, and the previous legislative acts, of England, before the indepen-

dence of the British Provinces, and afterwards, until the opening the ports of the Spanish colonies, will not admit of justification.

By the treaty between Great Britain and Spain, signed at Madrid, 13th (23d) May, 1667, it was provided that, perfect reciprocity of navigation and trade should be established between the King of Great Britain and the King of Spain, and their respective people, subjects and inhabitants. These privileges are stipulated for, in the fullest manner, both as to subjects, merchandise, and the duties to be paid.* These privileges extend to all dominions, including colonies and islands; but, as Great Britain and Spain both restricted the trade of their colonies to the mother country of each, it was stipulated, that the immunities and privileges, provided for in the treaty of 1667, were not to extend to the colonies, unless such intercourse should be at any future time allowed to the ships and subjects of any other foreign state. The treaties of peace and of friendship signed at Utrecht, between Great Britain and Spain, 2d (13th) of July, 1713, provided, that all privileges of trade and navigation, which should be enjoyed or granted, by either contracting power to the subjects of any other foreign state, should also be enjoyed in all the ports and dominions of the Kings of England and Spain, by their respective subjects.

All the foregoing treaties were renewed by the treaty of Versailles, 1783, and by the treaty of 5th of July, 1814. Both England and Spain have generally observed the faith of these treaties, and the wines of Spain, and of the Two Sicilies under Spain, have been treated upon their importation into England upon the same terms, as to duty, as those of Portugal under the Methuen treaty; while those of France and Germany continued to be subjected to a high differential duty. Any breach of faith, in regard to these treaties, will be found attributable to the frequent wars between the two countries,—to misinterpretations put on their provisions by the custom-house authorities in Great Britain and Spain, and to the suddenly disturbed administrations of the latter, which resulted, generally, in power being held by those who were ignorant both of commerce and of commercial treaties; and of whose neglect it would be not only unworthy, but dishonourable in a great nation to take advantage.

Although the ports of Spain, in the West Indies, and America, were opened to foreign trade in 1809, the old system of monopoly would have probably been renewed, at the peace, had not Spanish trade and industry been thoroughly paralysed before the year 1814. When the Spanish American republics achieved their independence of Spanish monarchical rule, the leading men, and the whole people, were not only ignorant of the true principles of trade and industry, but they retained, by tradition, and by habit, an hereditary attachment to all that

* See Articles 4, 5, 6, 7, 8, 10, and 11; and 38th of the Treaty of 1667.

† See Article of Treaty of 1670. See Treaty of Utrecht, 1713.

was unsound in the old Spanish colonial policy, and to all that was bigoted in the church. This was especially true in regard to Mexico: and to this ignorance, and to this intolerance, may we assuredly ascribe the impotent condition of that naturally rich, and still extensive, republic.

If we compare the natural fertility, and numerous advantages of the countries in America, discovered, conquered, and planted, by Spain and Portugal, and compare their present population, condition, and power, with those discovered, conquered, and colonised by the Anglo-Americans, we may form something like a conception of what would have been, at this day, the productive riches, and the internal, and external commerce, and navigation of Mexico, of Guatemala, of Brazil, and of the several republics of Spanish America, had they been colonised by a race animated and conducted by the same spirit, habits, industry, intelligence, and invention, which in agriculture, in the arts, in navigation, and in commerce, have distinguished the Anglo-Saxon race.

We have collected and condensed, with great labour, care, and expense materials in order to enable us to present to the public, the commercial and industrial statistics of the Spanish and Portuguese settlements in America. Our manuscripts, statements, and tables, would form many volumes in print. But such has been the vacillating legislation of those governments, that we are compelled to make but scanty use of those statements, and tables, and we shall confine our statistical accounts of these countries to such information only as we consider the most accurate, and most useful to manufacturers, merchants, and ship-owners.

CHAPTER II.

DIVISIONS OF SPANISH AMERICA UNDER THE MONARCHY.

PREVIOUSLY to the independence of the countries, in North and South America, comprised under the regal government of Spain, the Spanish colonies were administered in the following arrangement: viz,—

- 1.—In NORTH AMERICA—The *Viceroyalty of New Spain*, and the *Captain-generalship of Guatemala*.
- 2.—In SOUTH AMERICA, the *Viceroyalty of New Granada*, the *Captain-generalship of Caraccas*, the *Viceroyalty of Peru*, the *Viceroyalty of La Plata*, or *Buenos Ayres*, and the *Captain-generalship of Chili*.

The population of these vast regions, we believe never to have been, even as an approximate statement, ascertained. The following table is compiled on the

authority of Humboldt, Alcedo, and others ; and is estimated to include the natives and slaves :—

COUNTRIES.	Inhabitants.	Acres.	CAPITALS.	Inhabitants.
	number.	number.		number.
New Spain.....	6,500,000	1,690,000	Mexico.....	137,000
Guatemala.....	1,200,000	186,000	Guatemala.....	19,000
Cuba.....	690,000	43,350	Havannah.....	35,000
Puerto Rico.....	136,000	3,865	Puerto Rico.....	very populous.
New Grenada.....	1,800,000	Santa Fé de Bogota.....	30,000
Caraccas.....	900,000	Caraccas.....	20,000
Peru.....	1,300,000	3,350,000	Lima.....	54,000
Chili.....	800,000	Santiago.....	36,000
Buenos Ayres or La Plata..	1,100,000	Buenos Ayres.....	60,000
Making.....	14,336,000	5,273,215		

The above is exclusive of the unnumbered Indians of the Viceroyalty of La Plata. The Portuguese subjects in Brazil were estimated at the same time, to amount to 3,000,000: of whom one million and a half were slaves, one million Indians, and the remainder of European race.

Of the above total of 14,336,000 souls, there were 3,000,000 whites born in the country, 200,000 Europeans, and the remaining 11,136,000 were Indians, negroes, and mixed races, or castes, of which the Indians amounted to by far the greater proportion. The negroes in Caraccas amounted to 54,000, in Cuba to 212,000 ; the other states having comparatively very few slaves.

I.—VICEROYALTY OF NEW SPAIN.

Under the Viceroy, and the Supreme Councils (*Audienzas Reales*), New Spain was sub-divided into the three Provinces of *New Mexico*, and *Old* and *New California*, and the twelve intendencies of *Durango*, or *New Biscay*, *Sonora*, *St. Louis Potosi*, *Zacatecas*, *Guadalajara*, *Valadolid*, or *Mechoucan*, *Mexico*, *Puebla*, or *Tlascala*, *Vera Cruz*, *Oaxaca*, or *Guaxaca*, and *Merida*, or *Yucatan*.

The whole administration may be said to have been under the absolute despotism of the viceroy, the archbishop, and bishops, and the *Audienzas Reales*.

II.—CAPTAIN-GENERALSHIP OF GUATEMALA.

The account which, in its spirit, and in the simplicity of its description and statements, conveys the best proof of authenticity relative to this captain-generalship, under the Spanish sovereignty, is the work of Don Domingo Quarras, a native of the country. According to his authority, the government of this kingdom, as it was then named, was administered by the royal audiencia of Guatemala, the president of which was governor and captain-general of the kingdom, having a great number of inferior officers for the better regulation of the provinces. The spiritual affairs were directed by the Archbishop of Guatemala and three suffragans, except in the small district of I'ten, which was under the charge of the Bishop of Yucatan. The ecclesiastical division of the

kingdom consisted of four bishoprics, viz., Guatemala, which as metropolitan, extended over the whole kingdom; but the peculiar territory of the archbishopric of Guatemala extended 214 Spanish leagues from the plains of Motocinta, the most westerly village of the diocese, to the boundaries of the curacy of Conchagua, the most easterly; and 116 leagues from the Gulf on the northward, to the shores of the Pacific southward. In this district there were 108 curacies, twenty-three collated curacies of regulars, sixteen under charge of the Dominicans, four of the Franciscans, and three of our Lady of Mercy; 424 parochial churches, and 539,765 inhabitants. This bishopric was erected by Pope Paul III., under a bull bearing date December 18, 1534; from that period to 1809 the chair has been occupied by seven archbishops and sixteen bishops. The second bishopric is Leon, having jurisdiction over the intendancy of Nicaragua, and the government of Costa Rica: in it there were thirty-nine curacies, three establishments for the conversion of infidels, eighty-eight parochial churches, and 131,932 inhabitants. From its erection to the year 1809, this diocese has had thirty-seven bishops. The third was Ciudad Real, its jurisdiction comprehended the three divisions of the intendancy of Chiapa; it contained thirty-eight curacies, 102 parish churches, and 69,253 inhabitants. The fourth is Comayagua, the jurisdiction of which was confined to the intendancy of Honduras: within its territory there were thirty-five curacies, one establishment for the conversion of infidels, 145 parish churches, and 88,143 inhabitants.*

The civil government of the kingdom was divided into fifteen provinces, of these eight were superior *alcaldias*, viz., Totonicapan, Sololá, Chimaltenango, Sacatepeques, Zonzonate, Verapaz, Escuintla, and Suchiltepeques; two were *corregimientos*, viz., Quezaltenango, and Chiquimula; one a government, Costa Rica; and four were intendancies, Leon, Ciudad Real, Comayagua, and St. Salvador. Five of these provinces were situated on the shores of the Pacific; five on the Atlantic, and five interior.

In Guatemala, as well as in all other parts of Spanish America, the real power exercised by the bishops and other ecclesiastics, was much greater than that exercised by the civil government.

* In computing the number of inhabitants of the kingdom: parishioners of the dioceses, and inhabitants of the provinces, recourse has been had to the census taken by order of the King of Spain in 1788, as being the most recent and complete that could readily be consulted, because it gives the numbers in the separate provinces and districts. It may, however, be considered too low; for, by comparing it with the enumerations made by order of the bishops, there has been found a material discrepancy; if we add together the numbers of the different districts of the bishopric of Comayagua in the royal census of 1778, the amount will be no more than 81,143; whereas, that taken by order of the bishop in 1791, makes the number 93,501. In Chiapa, in 1778, the number given was 62,253, but, by a census in 1796, it was 99,001: similar increase has been perceived in the other two dioceses.—*Alcedo*.

III.—VICEROYALTY OF NEW GRANADA.

New Granada was bounded on the north by the Caribbean Sea, and the province of Costa Rica in the kingdom of Guatemala ; on the east by the government of Caraccas, Spanish Guiana, and Portuguese Guiana ; on the west by the Pacific Ocean ; and on the south by the river Marañon, and the viceroyalty of Peru : it extended from 3 deg. 30 min. south latitude, to 12 deg. north latitude.

This extensive viceroyalty was divided into numerous provinces, governed by intendants and governors under the orders of the viceroy.

These provinces were named Jaen de Bracamoros, Quixos, Maynas, Quito, Tacamees, Popayan, Antioquia, Santa Fé, San Juan de los Llanos, Merida, Santa Marta, Carthagena, Choco, Darien, Panama, and Veragua ; the three last of which were known by the distinctive appellation of Tierra Firme.

IV.—CAPTAIN-GENERALSHIP OF CARACCAS.

Caraccas is named after a tribe of Indians, and given to the country which included New Andalusia, or Cumana, with Margarita, Barcelona, Venezuela or Caraccas Proper, Maracaybo and Coro, on the coast of the Caribbean Sea, Varinas and Spanish Guiana, in the interior.

It was bounded on the north by the Caribbean Sea, east by the Atlantic, south by Peru and Dutch Guiana, and west by the kingdom of Santa Fé or New Granada.

Caraccas was subdivided into seven provinces : viz., New Andalusia or Cumana, Barcelona, Venezuela or Caraccas Proper, containing Venezuela and Coro, Maracaybo, Varinas, and Guiana, with the detached government of the island of Margarita ; the whole of these were under the superintendence of a personage of the highest rank, who was styled captain-general of the provinces of Venezuela, and the city of Caraccas.

V.—VICEROYALTY OF PERU.

Peru, as a viceroyalty, was bounded on the north by the southern provinces of Quito, Maynas, Jaen de Bracomoros, and Guayaquil ; on the west by the Pacific Ocean ; on the east, by the Portuguese possessions, and the provinces of Buenos Ayres ; and on the south, by the government of Chili and the viceroyalty of La Plata. It was formerly the most extensive kingdom of South America, but in the year 1718 the provinces of Quito in the north, as far as the river Tumbez, were annexed to the government of New Granada, and in 1778, Potosi, and several other of its richest districts, on the east, were annexed to the viceroyalty of Buenos Ayres. It extended, therefore, from the Rio Tumbez, in 3 degrees 30 minutes, south latitude, to the chain of Vilcanota, in 15 degrees south latitude.

Its eastern settlements bounded on Colonna, or the land of the missions, the Pampas del Sacramento, and the region of the savage nations of the Pajonal, a vast steppe covered with long grass.

Peru was, as a viceroyalty, divided into seven intendancies, viz.—Truxillo, Tarma, Huancavelica, Lima, Huamanga, Arequipa and Cuzco, each of which was governed by an intendant, nominated by the viceroy, a nobleman of the highest rank, who was sent from Spain, and whose appointment was one of the first consequence in Spanish America.

The salary of the viceroy was only 12,600*l.*, but enormously augmented by the monopoly of certain manufactures, by grants, and by the colonial situations and titles he could confer.

Peru was the seat of two royal audiencias, that of Lima and that of Cuzco. The audience of Lima was established in 1543, and was composed of a regent, eight oidores or judges, four *alcaldes*, and two *fiscals*, the viceroy being president. It was divided into three chambers, and was the superior court of appeal for the whole government. The royal treasury was the next great office of state, composed of the viceroy, the regent of the council, the dean of the tribunal of accounts, and other officers, and the revenue appeals were determined by the tribunal of accounts.

VI.—VICEROYALTY OF BUENOS AYRES, OR LA PLATA.

This viceroyalty was bounded on the north by the vast steppe of the Amazons, or, according to some authorities, by that great river itself; on the east the territories of the Portuguese and the Atlantic ocean were its limits; on the west it was divided by the Andes from Peru and Chili, having also a province bordering on the South Sea; and on the south its boundary was the Pampas and Patagonia.

From Cape Lobos on the Atlantic to the most northerly settlements on the Paraguay, its extent was estimated at 1600 miles; and from Cape St. Antony, at the mouth of the Plata, to the Andes of Chili, its breadth was about 1000 miles.

This extensive region was erected into a viceroyalty in 1778, and at that time several provinces were added to it from Peru and Chili. It was divided into five governments, Los Charcas, Paraguay, Tucuman, Cuyo, and Buenos Ayres, which were again subdivided into departments and districts.

The whole was governed by a viceroy, and the ecclesiastical affairs of the country were under the guidance of the archbishop of La Plata, in Charcas, who had six suffragans.

VII.—CAPTAIN-GENERALSHIP OF CHILI.

The kingdom of Chili or Chil  was the most southerly of the governments. which composed the Spanish American empire.

It extended from the 24th degree to the 45th degree of south latitude, and comprised the continent bounded by the ocean on the west, and the Andes on the east; with the islands on its coasts. Its greatest length was about 1260 miles, and its greatest breadth 300.

It was bounded on the north by La Plata, and from Peru it was separated by the desert and province of Atacama; on the east it was bounded by the Buenos Ayrean provinces of Tucuman and Cuyo, and by Terra Magellanica, or Patagonia; on the west, the Southern Pacific washed its shores; and on the south, the unconquered and desert countries of Terra Magellanica, completed its limits.

Chili was governed by a personage of high rank, appointed by the court of Madrid, and who held the title of Captain-General of the kingdom of Chili, having under his orders all the inferior governors of departments and military posts. He was likewise commander-in-chief of the Chilian forces, and president of the court of the royal audiencia of Santiago.

Chili was divided into continental and insular partidos, or departments, over which intendants, or lieutenants, presided.

The continental part, or Chili Proper, was divided into thirteen partidos, which extend from the twenty-fourth degree to the thirty-seventh degree of south latitude, and were named Copiapo, Coquimbo, Quillota, Aconcagua, Melipilla, Santiago, Rancagua, Colchagua, Maule, Itata, Chillan, Puchucay, and Huilquilemu. From the thirty-seventh degree to the islands of Chiloe, the country was chiefly under the power of three native tribes, the Araucanians, the Cunches, and the Huilliches.

Insular Chili, comprehending the archipelago of Chiloe, and Chonos or Guaytecas, and the Andean parts of Chili were inhabited by independent tribes.

CHAPTER III.

SPANISH AMERICAN REPUBLICS.

ALL the power of Spain has disappeared in continental America and we have now to refer to its subdivisions as republican governments.

POPULATION of each, as stated in the American Almanac for 1845.

COUNTRIES.	Popula- tion.	CAPITALS.	COUNTRIES.	Popula- tion.	CAPITALS.
SPANISH REPUBLICS OF NORTH AMERICA.	number.		Spanish Republics of S. America (<i>cont.</i>)	number.	
Mexico	*7,044,140	Mexico.	Bolivia	1,500,000	Chuquisaca.
Central America	2,000,000	San Salvador.	Chili	1,500,000	Santiago.
Yucatan	580,948	Merida.	Venezuela	800,000	Caraccas.
Haiti	933,000	Cape Haytien.	Equator	500,000	Quito.
Texas	250,000	Austin.	Isthmus of Panama	300,000	Panama.
			Paraguay	150,000	Assumption.
			Uruguay		Monte Video.
SPANISH REPUBLICS OF SOUTH AMERICA.			EMPIRE.		
Argentine Republic	2,000,000	Buenos Ayres.	Brasil	5,130,418	Rio Janeiro.
Peru	1,700,000	Lima.			
New Grenada	1,931,684	Bogotá.			

* According to the census prepared in 1841, by the Mexican "National Institute of Geography and Statistics. But this number includes Yucatan and Texas.—See Statistics hereafter.

The above must be considered as little more than approximate estimates.

CHAPTER IV.

MEXICO.

DESCRIPTION AND NATURAL RESOURCES.

IF the population, and productive industry, and the commerce of Mexico were commensurate with its natural fertility, and with the extent of the earth's surface which it comprises, it would have been before the present time one of the wealthiest and most powerful states of the world.

The united states, or federal republic of Mexico lies between 15 deg. and 42 deg. north latitude; the most southern limit being near Port Angelos (15 deg. 10 min. north latitude) and the most northern near Cape St. Sebastian. The most eastern point is on the shore of the peninsula of Yucatan, near the island of Cancun, which extends to near 86 deg. 48 min. west longitude; and the most western point is Cape Mendocino, in 124 deg. 40 min. west longitude. Yucatan, however, although nominally one of the federal states, is, *de facto*, an independent government.

On the west and south, Mexico is bounded by the Pacific Ocean; and on the east by the Gulf of Mexico. Its south-eastern angle borders on central America, and the British settlement of Belize. Between Mexico and Central America, the boundary-line is not exactly known, further than that it commences somewhere near the Barra de Tonato, thence north to the volcanic region of Soconusco, and thence irregularly over the slopes of the table-land of Guatemala to the Rio Usumasinta; it then follows the western side of the elevated country of Yucatan, somewhat south of 18 deg. north latitude to the Rio

Hondo, which as far as the sea, is considered the boundary between Yucatan and Belize.

On the north, and partly on the east, Mexico borders on the United States of North America. The northern boundary-line commences on the Pacific in 42 deg. north latitude and runs along that parallel to the Rocky Mountains; on the east of which range, before the independence of Texas, it followed the course of the Arkansas river to the 100th meridian, thence due south to the Red River, which it followed as a boundary as far as 94 deg. west longitude, and then the line ran due south to the River Sabina, and along that river to the Gulf.

From the boundary of Guatemala to 42 deg. north latitude, Mexico is about 2400 miles in length. Its breadth varies greatly. At the Isthmus of Tehuantepec, where it is narrowest, the distance is little more than 130 miles across. Its greatest width, when it included Texas, was near 32 deg. north latitude, whence it extended about 1230 miles from the Rio Sabina to Upper California. By the annexation of Texas to the United States of North America, this breadth is reduced to the distance between the Rocky Mountains bounding New Mexico, and the United States, in latitude 42 deg. north, and longitude 109 deg. 45 min. west, and Cape Mendocino, in latitude 40 deg. 30 min. north, and longitude 124 deg. 10 min. west, or about 700 miles.

Our accounts of Mexico are far from being complete. The country has been so imperfectly explored,—that it is even asserted that there are within it independent nations, living in large towns, which are only known by report. Our brief descriptions are necessarily confined to the districts which have been settled or travelled over: but we have adhered to what appeared to us the best Spanish, English, and American accounts; not only of Mexico but of the other Spanish American republics. Our most authentic recent accounts, excepting the work of M. Chevalier, are all written by citizens of the United States. We have but little information that can be relied on, by British travellers in Mexico, with the exception of the valuable and comprehensive work of Mr. Ward,—who resided in the country as minister, after its independence of Spain, in 1826. The citizens of the United States have exclusively, since 1840, acquired a more accurate knowledge of the Mexican territories, especially of the northern parts, than ever was known before, unless it were formerly by the Jesuits, and the ecclesiastics of the Indian missions.

The works of Clavigero, Alcedo, Humboldt, and Ward, are the usual authorities in describing Mexico. The work of Latrobe, and the notes of Poinsett, are also referred to. The most recent accounts upon which we can rely as to the present state of Mexico, and the best local descriptions, are found in the work of Mr. Brantz Mayer, who was Secretary to the United States Legation at Mexico, in 1841 and 1842; of New Spain or Northern Mexico, in Mr. Gregg's work on the "Commerce of the Prairies and Santa Fé; and of California, in that admirable work, "The Account of the United States Exploring

Expedition, under the Command of Captain Wilkes;” and of California, in the “Narrative of the Exploring Expedition, in the Years 1842, 1843, and 1844, under Captain Fremont, of the Topographical Engineers, to the Rocky Mountains, Oregon, and North California;” from each of these works, we have extracted and condensed the most instructive information, relative to a country to which great interest must in future be directed. Of many parts there is certainly little known; but we have more certain accounts, through the indefatigable perseverance of Anglo-American travellers, of the towns and districts through which the old Spanish roads and routes passed, and of California and Northern Mexico, than we possess of other parts of Spanish or Portuguese America.*

CHAPTER V.

TERRITORY.—POPULATION AND DEPARTMENTS.

ACCORDING to the best authorities, the territory of the Mexican republic contains an area of 1,650,000 square miles, exclusive of Texas: and the area of the United States of Anglo-America may, exclusive of Texas, be estimated at 2,300,000. “If we allow,” says Mr. Mayer,† “that the square mile will maintain, under ordinary careful cultivation, a population of 200 persons, we shall have the sum of 330,000,000 for the total ultimate capability of the Mexican soil, and 460,000,000 for the United States.—or, 130,000,000 less in Mexico than in our union.”

In 1792, according to a report made to the King of Spain by Conde de Revellagigedo, the population of New Spain, exclusive of the Intendencies of Vera Cruz and Guadalaxara, was as follows:—

CASTES AND CLASSES.	Population.	CASTES AND CLASSES.	Population.
	number.		number.
Indians.....	2,319,741	Total brought forward.....	4,483,529
Europeans.....	7,904	To which may be added the population of	
White creoles.....	677,458	Vera Cruz and Guadalaxara, according	
Different castes.....	1,478,426	to the estimate of 1803.....	786,500
Total.....	4,483,529	Total population, in 1793.....	5,270,029

The Baron Humboldt estimates the population to have been, in the year 1803, 5,837,100; and Mr. Poinsett, in 1824 (from the best data of the period), 6,500,000.

* We have just received a recently-published Journal of Travels in Mexico, by Mr. Gilliam, who had been appointed United States consul in California, to which he does not appear to have proceeded further than to the neighbourhood of the Gulf. This book appears, when confined to mere detail, to contain truthful accounts of the places and people he met with. But the style is ludicrous, inflated, and abounds in, not *Yankeeisms*, but in painful attempts to write sentiments composed of superlative adjectives.

† Mexico. By Brantz Mayer, Secretary of the United States Legation to that country in 1841 and 1842.

In 1830, Mr. Burkhardt, a German traveller, rates the several classes of Mexicans thus:—

CASTES AND CLASSES.	Population.	CASTES AND CLASSES.	Population.
	number.		number.
Indians.....	4,500,000	Brought forward.....	5,506,000
Whites.....	1,000,000	Mestizos, and other castes.....	2,490,000
Negroes.....	6,000	Total.....	7,996,000
Carried forward.....	5,506,000		

The most accurate of the recent calculations, is said to be the one which was made by the government without special enumeration, as a basis for assembling a Congress to form a new constitution, similar to the plan of that adopted in Tacubaya in 1842:—

DEPARTMENTS.	Population.	DEPARTMENTS.	Population.
	number.		number.
Mexico.....	1,389,520	Brought forward.....	5,973,484
Jalisco.....	670,311	Sinaloa.....	147,000
Puebla.....	661,902	Chiapas.....	141,206
Yucatan.....	580,948	Souora.....	124,000
Guatemala.....	512,006	Queretazo.....	129,560
Oajaca.....	500,278	Nuevo Leon.....	101,108
Michoacan.....	497,906	Taunaulipas.....	100,068
San Louis Potosi.....	321,840	Cosahuila.....	75,340
Zacatecas.....	273,575	Aguas Calientes.....	69,698
Vera Cruz.....	254,380	Tabasco.....	63,589
Durango.....	162,618	Nuevo Mexico.....	57,926
Chihuahua.....	147,600	Californias.....	33,439
Carried forward.....	5,973,484	Total, in 1842.....	7,015,509

Mr. Mayer states that “since the year 1830, the population of the republic has been dreadfully ravaged by smallpox, measles, and cholera. In the capital alone, it is estimated that about 5000 died of the first-named of these diseases, 2000 of the second, and from 15,000 to 20,000 of the third. The mortality must have been in a corresponding ratio throughout the territory.

“I am, however, by no means satisfied that the estimates of both Poinsett and Burkhardt are not too high; yet, assuming the statements of 1842 and of 1793 to be nearly accurate, we find in forty-nine years an increase of only 1,774,111 in the entire population. Again, if we assume the population to have been 6,000,000 in 1824, (the year, in fact, of the establishment of the republic,) we find that, in the course of eighteen years of liberty and independence, the increase has not been greater than 1,044,140.

“In the United States of America, with only 650,000 more of square miles of territory *now*, and not so large a space at the achievement of our independence, the increase of our population during the first twenty years of freedom cannot have been less than two millions and a half; while, in the course of the last thirty years, it has averaged an increase of rather more than thirty-three per cent, every ten.

“The several castes and classes of Mexicans may be rated in the following manner:—

CASTES AND CLASSES.	Population.	CASTES AND CLASSES.	Population.
	number.		number.
Indians.....	4,000,000	Brought forward.....	5,006,000
Whites.....	1,000,000	All other castes, such as zambos, mestizos, mulattoes, &c.....	2,009,509
Negroes.....	6,000	Total.....	7,015,509
Carried forward.....	5,006,000		

“It appears, therefore, that the Indians and negroes amount to 4,006,000, and the whites, and all other castes, to 3,009,509. A very respectable and aged resident of Mexico, who is remarkable for the extent and accuracy of his observations, estimates

that, of the former, (or negroes and Indians,) but two per cent can read and write; while of the latter, at a liberal estimate, but about twenty per cent.

"If we take this computation to be correct, as I believe from my own observation it is, and using the estimate of the decree of 1842 for the basis of the population, we shall have:—

CASTES AND CLASSES.	Population.
	number.
Of Indians and negroes who can read.....	80,120
Of whites and all others.....	607,628
Total able to read and write out of a population of 7,000,000.....	687,748

"This would appear to be a startling fact in a republic the basis of whose safety is the capacity of the people for an intellectual self-government. Let us, however, carry this calculation a little further. If we suppose that out of the 1,000,000 of *whites*, 500,000, or the half only, are *males*, and of that 500,000, but twenty per cent., or but 100,000 can read and write, we will no longer be surprised that a population of more than 7,000,000 has been hitherto controlled by a handful of men; or that, with the small means of improvement afforded to the few who can read, the selfish natures of the superior classes, who wield the physical and intellectual forces of the nation, have forced the masses to become little more than the slaves of those whose wit gives them the talent of control."—*Mayer's Mexico*.

CHAPTER VI.

CONFIGURATION, SOIL, AND CLIMATE.

THE configuration, soil, surface, and climate of Mexico, comprehend every variation of character. Low and unhealthy lands, along many parts of the sea-coast, especially the low plain of Cuertlachtlán, facing the Gulf, along the shores of which sandhills frequently rise. Low lands form only exceptions along the Pacific; and occur at the Bay of Tehuantepec, and at Acapulco; but generally the mountain or table-land approaches the shores of the Pacific and of the southern part of the Gulf of California.

The peninsula of YUCATAN, is one of the provinces or states of Mexico, but politically, as well as physically, almost independent of the Mexican republican government. This state is surrounded on three sides by the sea, the Gulf of Guanajos, or of Honduras, and the Gulf of Mexico. It is bounded on the south by the former province and *alcaldia mayor* of Vera Paz, and on the south-west by Chiapa, and by about 250 miles of Tabasco. It lies between the latitudes 18 deg. and 21 deg. north, and longitudes 87 deg. and 91 deg. west. Its length is about 250 miles from south-west to north-east, and its breadth is about 200 miles from east to west at the widest part. Alcedo describes its climate as—

"A very hot and moist temperature. Its territory is for the most part stony, but fertile. It has no other river throughout the whole of it than that of Lagartos, which is, however, very abundant. (This is not true, several small rivers flow through parts of

the state.) It is argued that it has many subterraneous waters, and this is pretty well proved, through certain deep chasms of stone, which they call *zenotes*, and in which water has been seen to run.

"The land is plain, covered with shady trees, and abounding in honey, wax, and cotton, and of the latter they make spun and woven stuffs, which they die of various colours, and which are highly esteemed in all Nueva Espana. It also produces some cochineal, and from the above productions, as well as from some Campeche-wood, and some rigging, which they manufacture, do they maintain a commerce. In its forests are excellent sorts of woods, of which some ships have been built; and one sort of these woods, called *habin*, is so hard that it is impossible to drive a nail into it without first boring a hole. Here are many wild beasts, such as tigers and leopards; also snakes and venomous insects, and a species of spider, which the Indians call *ham*, since, whenever a person is bitten by it, the excruciating pain he suffers causes him to cry out this word, and this he continues doing till he dies, no remedy ever having been found against its fatal influence. Both sheep and neat cattle are scarce in this province, through want of water and pastures; but here are abundance of swine, as well as of all kinds of fruit of a warm climate. On the sea coasts is found much amber."

The recently explored ancient ruins are remarkable. (See Mr. Steven's work.) Mr. Ward considers Yucatan the most sterile and poor state in the confederation. We have no recent account upon which we can place much reliance, and our consular returns (See trade of Mexico hereafter) convey little information relative to Yucatan, a country which may, to a great extent, be considered a wilderness. We believe that portions of this state are susceptible of the most productive tropical cultivation.

TABASCO, which has been politically united to the Mexican republic, but which is but little more than nominally annexed, adjoins on the east Yucatan, and on the south Chiapa, and the kingdom of Guatemala, from whence it is separated by a *cordillera*, or *serrania* of mountains: on the west it is bounded by the province of Oaxaca, in Nueva Espana, and it fronts the Gulf on the north. It is about 180 miles long, and about 60 broad. Alcedo describes it as—

"Of a hot and moist temperature, and the territory is low and plain, but very full of woods in which there are abundance of cedars, brazil, and many other sorts of woods. The country is unhealthy from the abundance of rain, and the prevalence of strong winds, which last for nine months together; but it is very fertile in fruits of the country, such as *mameyes*, *zapotes*, *aguacates*, *quaybas*, and man" others of a delicate taste, as also in European productions.

"It produces much maize, of which there are three or four crops annually; rice and cocos, which are sent for sale to Vera Cruz; pulse, garden and many medicinal herbs, tobacco, and, above all, *cacao*, this being the most abundant production of any, and that which is the greatest source of commerce; it being also in this that the natives used to pay their tribute to the Emperors of Mexico. It is not less abundant in pepper, which is much esteemed, and of which great quantities are carried to all parts, although of inferior quality to the pepper of the east. The breed of cattle, of all species, has increased greatly in this country; and in the woods there are leopards, *dantas*, small boars, rabbits, deer, monkeys, squirrels, *tapeyes*, *quintes*, similar to stags but smaller; and very many birds, such as pheasants, parrots, quails, hens, pigeons, doves, and an infinite number of others, large and small. Although the cotton-tree be here in abundance, the fruit is made no use of, since it is eaten by the monkeys before it ripens, as also by the squirrels, and other small animals, with which the country is overrun. But all these plagues are less obnoxious than the mosquitoes, of different kinds, which will scarce suffer men to exist; for no one can sleep except covered by a canopy, the heat caused by which is intense.

"This province is watered by different rivers, which fertilise it ; but the most considerable is that of its name. The capital is the settlement of the same name, called also De Nuestra Senora de la Victoria."

TABASCO ISLAND, or rather a neck of land, lies in the south-west part of the Gulf of Mexico, and at the bottom of the Gulf of Campeachy: on it is built the town of Tabasco, in latitude 18 deg. 34 min. north, and longitude 93 deg. 36 min. west. Alcedo says:—

"It is the capital of a province of the same name, and is situate at the mouth of the river Grijalva, seventy-six miles east of Santa Ana, and 127 miles east-south-east of Vera Cruz. It was considerably enriched by a constant resort of merchants and tradesmen at Christmas. The river Grijalva divides itself near the sea into two branches, of which the western falls into the river Tabasco, which rises in the mountains of Chiapa, and the other continues its course till within four leagues of the sea, where it subdivides and separates the island from the continent. Near it are plains, which abound with cattle and other animals, particularly the mountain cow, so called from its resembling that creature, and feeding on a sort of moss found on the trees near great rivers."

The state of Tabasco, naturally fertile, may be considered as chiefly in a wilderness state.

CHIAPA was formerly a province and *alcaldia mayor* of the kingdom of Guatemala; bounded on the north by Tabasco, east by Vera Paz, west by Nueva España, and south-west by Soconusco. It extended, as a Spanish province, eighty-five leagues from east to west, and is nearly thirty across at its widest part. It was under Spain divided into districts, or *alcaldias mayores*, viz., those of Zoques, Chontales, Los Llanos, and Xiquipila. Its climate is of a warm and moist temperature, although in some high parts cold predominates.

"Its woods," says Alcedo, "abound with large trees of pine, cypress, cedar, and walnut; and of others of a resinous kind, from which are extracted aromatic gums, balsams, and liquid amber, tacamaca, copal, &c. It produces also, in abundance, swine, maize, honey, cotton, cochineal, which is only made use of for the purpose of dyeing the cotton; also cacao, and much pepper and achote, or the heart-leaved bixa; also various kinds of domestic and wild birds, especially parrots, which are very beautiful and highly esteemed; a small bird, called toto, less than a young pigeon, with green wings; this is caught by the Indians, who pluck from its tail some feathers, which they prize highly, and then restore it to liberty; it being a capital offence, according to their laws, to destroy it. The sheep, goats, and pigs, which have been brought from Europe, have multiplied in this province in a most extraordinary manner; so also have horses, which are of such an esteemed breed, that the colts are taken from hence to Mexico, a distance of 500 miles. In the woods breed many *lions* (?) leopards, tigers, and wild boars, a great number of snakes, some being twenty feet in length, and others of a beautiful crimson colour, streaked with black and white. The territory is, for the most part, rugged and mountainous, and watered by different rivers: none of these, however, are of any particular consideration, although that which bears the name of this province is the medium by which the aforesaid productions are carried to the other provinces; and although this province may be accounted comparatively poor, from being without mines of gold or silver, it is, nevertheless, of the greatest importance, as being the outwork or barrier to New Spain, from the facility with which this kingdom might be entered by the river Tabasco. The capital is the royal city of Chiapa, situated on a delightful plain. It is the head of a bishopric, erected in 1538; and has for arms a shield, upon which are two *sierras*, with a river passing between them: above the one is a golden castle, with a lion rampant upon it; and above the other a green palm, bearing fruit, and another lion, the

whole being upon a red field. These arms were granted by the Emperor Charles V. in 1535. The cathedral is very beautiful. It contains three convents of the order of St. Francis, La Merceda, and St. Domingo; a monastery of nuns, and five hermitages. Its population is scanty and poor, and the principal commerce consists in cocoa-nuts, cotton, wool, sugar, cochineal, and other articles. Its nobility, although poor, are very proud, as having descended from some ancient families of the first nobility of Spain; such as those of Mendoza, Velasco, Cortes, &c. The women suffer great debility at the stomach on account of the excessive heat, and they can never fast long."

This state has not improved since its independence of Spain.

VERA-PAZ was formerly a province and *alcaldia mayor* of the kingdom of Guatemala; bounded north by Yucatan, south-south-west and south-east by Guatemala, west by the province of Chiapa, and east by the Gulf of Honduras. It was, under the Spanish rule, in extent forty-eight leagues from north to south, its widest part. The Missionaries of St. Domingo gave it this name, by order of the Emperor Charles V., who commanded it to be so called, inasmuch as its natives were conquered merely by preaching, and without bloodshed.

"The country," as described by Alcedo, "is rough and broken, full of deep ravines, with a *llanura* which is half a league in extent, and covered with thick and impenetrable woods. Half of this province is of a mild and benign temperature, and the other half is hot and abounding in mosquitoes of various kinds. The rains here continue nine months in the year, and the province abounds in vegetable productions and cattle, and has many mountains covered with trees, and vast caverns, in which many rivers laving the province, lose themselves. Between two lofty sierras is found a cave of very great extent, entirely of stone, within which are formed, by the dripping of waters, several pillars resembling alabaster. In this cave the cold is extraordinary, and the noise of the waters is very great, which, bursting forth at various mouths, forms a lake, which from its depth is seen to have waves like a sea, and from it rises a river, which, in the small distance that it runs, is not fordable. Besides the several rivers which water this province, great torrents of water are seen rushing down from the most lofty rocks, forming a delightful spectacle; and thus the soil is constantly so moist that the maize rots in the ground.

"This province is very subject to great tempests of thunder and lightning, strong winds, and earthquakes; and in its mountains and forests are large trees of excellent kinds of wood, imparting a balmy fragrance to the surrounding air; and amongst these we must note in particular the liquid amber of a thick and rough wood, and various kinds of balsams *copales*, *xuchicopales* *almacigos*, and dragon plants, from which is extracted the gum, called dragon's blood. Here are canes of 100 feet long, and of such thickness and size as to have at each of their knots a cavity able to contain an *arroba* of water. These canes serve as timber in building. Moreover, here are Guaya-canes, which are incorruptible, and another sort of wood, which, sawed asunder, represents on its plane pretty vary-coloured figures.

"This province is extremely fertile in all European fruits and flowers; these yielding their sweets to the labours of an infinite variety and innumerable swarms of bees; some without sting, and noted for making the clearest honey, others, like those of Spain, and others only as large as flies, others, again, whose honey causes giddiness; with this peculiarity, however, equally attached to all, that they make no honeycomb, but work under ground, forming their nests in the roots of trees. Their honey has an acid flavour, which is got rid of in a great measure by boiling; and it is not unfrequently kept and used after the same manner as the vinegar from oranges, for several domestic purposes. The woods of this province are thronged with animals and wild beasts; the largest of these is the *danta*, as big as a calf, though somewhat short and thicker set in all its joints, which on the whole resemble those of the elephant; it has on its claws, three joints on the fore feet and four on the hind feet; the head is large, the forehead is sunk in, the eyes small, and the lower jaw hangs down five or six inches, and is raised when the animal

is angry, thereby discovering its teeth and tusks, which are like those of a pig; its ears are peaked, the neck is sunk in the shoulders, and the tail short, with little bristles. The hide is six fingers thick, double at the loins, and, when dried, resists every kind of arms. This animal is ferocious and terrible when irritated, and with its tusks destroys every thing it meets in its course, not excepting trees of considerable strength. Here are likewise lions, tigers, bears of an enormous size, cats, and mountain goats, monkeys of various kinds, wild boars, porcupines, squirrels, and a variety of other animals. Also amongst the birds are eagles, small eagles, *buairones*, sea-crows, *alcatraces*, bitterns, storks, parrots, and others esteemed for their plumage and their song. This province is also filled with vipers and snakes of various kinds. The fountains and small rivers are numerous and run into the Gulf of Mexico."

CHAPTER VII.

MEXICO PROPER.

THE high mountains, called the Andes, which converge in Central America diverge north of the Isthmus of Tehuantepec, and approaching the shores of the Pacific on the west, and towards the Gulf of Mexico on the east, spread into the most extensive plateaux in the world. The great central plateau, or table-land, of Anahuac, extends north to about 24 deg. north latitude; and the plain, or great broad fertile valley, of Chihuahua, and even the great Prairies, may be considered as a further extension of the Mexican plateau. Along the Pacific, the low lands of Cinaloa, Acapulco, and Tehuantepec, are the widest districts between the sea and the mountains. In other places numerous low hills intervene, while frequently the mountains rise almost abruptly from the ocean.

On the eastern coast, the low districts, of the provinces of Vera Cruz and New Santander, extend northerly along the gulf to the Rio del Norte, the assumed boundary of Texas. This coast has no good harbours: Vera Cruz being the best; and, at the mouth of the Lake Panuco, Tampico the next port of any consequence. The mouth of the Rio Santillana, or Barra de Santander, also admits small vessels; and to the south of the highlands, called the Sierra de St. Martin, which intervene between the Plain of Cuétlachtlan and the Isthmus of Tehuantepec, several small rivers flow into the gulf, the principal entrance of which, the Coalzacoalcos, was recently surveyed with a view of digging a canal across the Isthmus. The shallowest water over the bar is in that survey given as 6.2 metres, nearly twenty feet: we doubt the fact.

The low coast of the Gulf of Mexico, north of 21 deg. north, is lined with sand-hills, and within which are large and small lagoons; the principal of which are the lagoons of Tamiagua, Tampico, Morales, and Madre. The breadth of the plains, or low country, from the gulf to the high or undulating lands, is stated to vary from about eight miles south of Vera Cruz, to from twenty, fifty, and sixty

miles further north. On the western coast, north of about the twenty-fourth degree, the shores of the Gulf of California present a diversity of surface, in some few parts low, and, generally, undulating at no great height above the sea; the soil tolerably fertile, with little wood except in the river valleys. The climate is described as healthy: the rainy days during the year being on an average about ninety. Towards the northern parts, or the head of the Gulf of California, the lands are often low, and faced with sand-hills, but the soil behind, except in the undulated country, is not considered fertile.

The great table lands of Mexico, and those extending north to the American prairies, are the most important, both with respect to soil and climate; and, although Mexico has the disadvantages of few good harbours, along the sea or gulf coast, and a climate the most fatal to human life, along the latter, yet, the soil and mines of the extensive regions of elevated plains, are adapted, under a secure, liberal, and permanent government, to maintain a population of more than 100,000,000 inhabitants, and to render Mexico a state of great power and wealth.

The ascent from the Plain of Vera Cruz to the table-land of Anahuac is rather abrupt, and the road from Vera Cruz, which was kept in good repair, is now, in many parts, described as in the most wretched and broken condition. It leads over a number of ascents, with intervening plains.

On these plains isolated mountains rise. Near the eastern boundary of the table-land, and bordering the Plain of Cuertlactlan, the Pic de Orizaba, rises 17,373 feet above the sea, and the Nauhcampatepetl, or Coffre de Perote, to 13,415 feet in height. These mountains are, north to south, about thirty miles distant from each other. In about 19 deg. north longitude, and 98 deg. 10 min. west longitude, the Popocatepetl rises to 17,884 feet, and is supposed to be the highest mountain in North America; north of which the Iztaccihuatl, is 15,704 feet high. Further west is the Nevado de Toluca, 15,271 feet high. The Pic de Tancitaro, near the Pacific, 10,509 feet high; not far from which the volcano of Colima rises 9193 feet above the sea. Four of these mountains only rise above the region of perpetual frost, or, in Mexico, about 15,000 feet above the sea. Nearly all these mountains are evidently of volcanic origin; three are said to be in a state of activity—the Orizaba, the Popocatepetl, and the volcano of Colima. In 1759, a volcano burst forth on one of the lower plains near the Pacific, which was called the volcano of Jorullo, it rose about 1700 feet above the plain. We are not certain if it be still in activity.

The highest elevation of the plateaux of Anahuac adjoins, or extends between, the foregoing named mountains and the isolated peaks above-mentioned. From the western base of the Orizaba and Nauhcampatepetl, the table-land of Tlascala extends in breadth about seventy miles, and in length about 100 miles. Its plateaux rises about 7200 feet above the sea. On the west of this table-land is the Plain of Mexico, or Tenochtitlan, which rises still higher, or about 7500

feet above the sea. It is about fifty miles long, and about twenty-five miles broad. Beyond the latter plain lies the most elevated of the Mexican plateaux, the Plain of Toluca, the average height of which is nearly 9000 feet. The table-land of Michoacan, west of Toluca, varies in height from 6000 feet to 6500 feet. It is interspersed with high hills and detached ridges. It is about ninety-six miles broad, and 100 miles in length. A lower country lies between Michoacan, and the Pacific. This lower district is occasionally hilly and undulating.

That section of table-land which extends south-easterly from the Plains of Tlascala and Mexico, to the Isthmus of Tehuantepec, is called the plateaux of Mixtecapan; the average height is stated to be about 5000 feet above the sea. It is traversed towards the Pacific, however, by broad valleys. The town of Oaxaca, situated in the largest valley, is about 4800 feet above the sea; the adjoining high ground, on which are the ruins of the palace of Mitla, is 5300 feet high. Along the sea-coast to the north-west, and sloping down to Acapulco, the table-land is traversed by deep valleys, extending in an east and west direction. The road from Mexico to Acapulco passes across four of them. They decline towards the sea.

It is rather presumptuous to speak positively of a country so ill explored as Mexico, but all authorities agree in stating that no continuous range of mountains traverses the southern section of table-land, except the hilly ridges which separate the plains from each other. These rise 500 feet or 600 feet—some peaks above 1000 feet, above the plains. In about 20 deg. north latitude, the heights, which bound the limit of the plain west of the city of Mexico, rise in a continuous range, called the Sierra Madre. This range follows in a west-north-west direction near the town of St. Felipe, and thence north-westerly to the south of the town of Durango. This northern Andean chain extends in greater breadth north-north-westerly, along the eastern boundary of the Plain of Chihuahua, separating that plain from the low region of Cinaloa, and the mountainous district of Sonora. Near the Presidio de S. Bernardino, about 32 deg. north, rises the mountain de las Esquelas. The elevation of this great range is not well ascertained, but it rises to a considerable height east of the town of Durango, where the mines, in valleys, are from 8000 to 9000 feet above the level of the ocean.

The region between 20 deg. and 24 deg. north latitude comprises the elevated plains (about 6500 feet above the sea) of Querétaro, S. Luis de Potosi, and Guadalajara. The two first border on the Sierra Madre: Querétaro extending along the south, S. Luis de Potosi to the north. The fertile district of Baxio in Querétaro extends along the banks of the Rio de Santiago. East of the plateau of S. Luis de Potosi, and above the low lands which extend back from the Gulf of Mexico, a range of mountains, the Catorce, rises about 2000 feet above the plain, and to about 8000 feet above the sea.

The plain of Querétaro extends westward to about 101 deg. 40 min. west longitude, where it is traversed by a hilly region, between which the country descends, and the table-land of Guadalupe, which extends westward to the shores of the Pacific, is considered not higher than from 3000 feet to 4000 feet above the sea, and the surface is diversified by hills, depressions, and valleys.

The great plateau of Anahuac is of varied fertility. In some places the surface exhibits bare rocks, in others tough moving clay. The vegetable mould is usually dry. The aridity of the soil is accounted for by the great elevation of the table-land, the rapid evaporation, and the volcanic structure of the rocks of the mountains. The plains are, in general, destitute of wood, which occurs but seldom, except in the valleys. There are numerous lakes, usually shallow, and their water brackish; running streams and springs are rare.

RIVERS OF ANAHUAC.—From the dryness of the atmosphere and the nature of the soil, Anahuac has few rivers. The streams which flow from it are only navigable for a short distance from the sea; they are rapid and shallow. The Rio Santiago, called also Rio Grande, and by the aborigines Tololotlan, rises in the small lake of Lerma, to the east of the volcano of Toluca, and winds for a distance of about 405 miles to the sea. It traverses the plains of Toluca and Querétaro, in a north-west direction. It is generally deep and not rapid, but it does not appear that it is navigated in these parts. It gradually turns to the west, and flows by a rapid course to the Plain of Xalisco, and through the large lake of Chapala. Rushing from that lake, it descends at the Puente del Rio Grande, in a distance of about one league over fifty to sixty falls of various heights, and flows with impetuous rapidity to near its estuary, in which rise several islands. On its southern bank is the port of San Blas.

The Rio Panuco rises in the plateau of Tenochtitlan; for the water conveyed by the canal of Huehuetoca from the lake of Zumpango forms its most extreme source. It is for a great distance rapid, and becomes only navigable for boats at Tanquichi, about 170 miles from its mouth. Ten miles lower down it is joined by the Rio Tamoin, which flows from the west; above which its name is the Moctezuma, and between which it is called the Panuco. It passes the town of Panuco eighty miles from its mouth. Vessels drawing not more than twelve feet water ascend to this town. It falls into the Gulf of Mexico, at the port of Tampico, about 400 miles from its source.

The lakes of Mexico are numerous, and occasionally occupy a considerable portion of the plains. One-tenth of the plain of Tenochtitlan is covered by the lakes of Zumpango, Christovol, Tezcuco, and Chalco. The largest lake is that of Chapala, on the plain of Xalisco, and is traversed by the Rio Santiago. It is about ninety miles long, and from twelve to eighteen miles wide.

That portion of the Mexican isthmus which lies between 24 deg. and

32 deg. north lat., contains four different regions: the western coast, the Sierra Madre, the elevated plain of Chihuahua, and the eastern Lowlands.

The western coast of Mexico north of latitude 24 deg. north, occupies the shores of the Gulf of California. The district south of the Rio Yagui, in 28 deg. north latitude, is a level with undulations. The soil, consisting chiefly of sandy clay, with little wood. The beds of the rivers are many feet below the surface of the plain, and are bordered with rich alluvial soils. The climate is temperate, although the rainy season lasts, generally, from the end of June to the end of September. The country between the Rio Yagui and 32 deg. north latitude comprises ranges of high hills, often approaching the sea, and intersected by deep, narrow ravines. In some places this hilly country extends nearly to the shore. In other parts these extensive plains between the shore and the hill country, towards the north head of the Gulf of California, are low, and covered with brushwood, and separated from the sea by sand-hills, about twenty feet in height, and about fifty yards from the shore. These plains are arid, and with few or no inhabitants. Several streams rising in the mountains flow down to the Gulf: the soil is either sandy, or a hard clay.

The Yagui, or Rio de Sonora, rises to the north of the parallel of 32 deg. in the Sierra Madre. Its whole course is, probably, not less than 400 miles. It does not appear that it is navigated. Its waters are used for irrigating the adjoining lands where cultivated.

The plateau of Chihuahua, extending along the eastern base of the Sierra Madre, is a continuation of the table-land of S. Luis de Potosi. It extends from south-south-east to north-north-west, about 600 miles, and is terminated on the north by a line drawn from the Presidio de S. Bernardino to the Paso del Norte, near the parallel of 32 deg. It varies from 150 to 200 miles in width. Its southern extremity, contiguous to the table-land of S. Luis de Potosi, is considered to be nearly 6000 feet above the sea. It declines towards the north. This region has been compared to the steppes of Asia. The surface of this table-land is generally level. The soil is impregnated with nitre, muriate of soda, and carbonate of potash; is entirely destitute of wood, except along the streams, which are bordered with poplars and some other trees. Its pastures feed sheep during the winter months. In dry weather the verdure disappears, except along the rivers. In some districts, distant from the rivers, there are dry salt-lakes, from which salt is collected. These salt-lakes render the country excessively unhealthy; for whenever there is any wind, the air is filled with saline particles and dust, which oppress respiration and cause numerous diseases. The rivers, along which alone the cultivated tracts occur, flow generally in ravines several feet below the surface of the plain, and terminate (with the exception of the Rio Conchos) in lakes without outlets. The principal rivers are the Rio de las Casas Grandes, the Conchos, and the Rio Grande.

The Rio de las Casas Grandes, which rises in the Sierra Madre, runs northerly, about 100 miles, into the Lake of Guzmán. The Rio Conchos rises in the Sierra Madre, bends to the south, and then flows north, being increased in its course by numerous tributaries from the west, for about 300 miles, into the Rio Grande del Norte, nearly opposite the Presidio del Norte. The valley of this river is the most populous and best cultivated part of the plain of Chihuahua. The Rio Grande of the plain (a different river from the Rio Grande del Norte), rises in the Sierra Madre, west of the town of Zacatecas, and runs at first north-east, as far as the place where it descends into the plain, through which it winds in a north direction, terminating in the lake of Parrus, about 27 deg. north lat. Its valley is tolerably well cultivated, and is said to be embellished with orchards.

The north-eastern part of the plain of Chihuahua is occupied by a mountain region, at least towards its northern extremity, called the Bolson de Mapimi. Very little is known of this region. It extends northerly to the banks of the Rio del Norte. The mountains of Salinas and Pesquoria attain an elevation of more than 10,000 feet above the sea, but from 27 deg. to 28 deg. north latitude, the mountain range scarcely rises above the level of the plain of Chihuahua.

A low country, which may be considered an extension of the low plain of New Santander, intervenes between the Bolson de Mapimi and the Gulf of Mexico. Its width, as far as we know, varies between sixty and 120 miles. It is covered with wood only in part, and comprises extensive prairies covered with grass. Along the coast the land is low, and the soil either sandy or swampy, and skirted in many parts by sand-hills. Further back the soil is fertile; but the want of good harbours has, with other causes, retarded the settlement and cultivation of this region.

A vast plain extends from the head of the Gulf of California eastward, and on both sides of the Rio Gila, over the continent to the banks of the Rio del Norte, north of the Paso del Norte, between 32 deg. and 34 deg. north latitude. This plateau is very little known, but it has been described as a sandy, sterile, and nearly uninhabitable country.

CLIMATE.—No country has greater extremes and varieties of climate than Mexico. Great difference of temperature would naturally be found in regions extending from the latitudes of 16 deg. and 42 degrees 30 min. north, even if the whole were of about an equal altitude above the sea; but the great inequality of surface, from districts scarcely more than a few feet above the sea, to the tablelands, which rise to 8000, and even 9000 feet above that level, and to the mountain summits, accounts sufficiently for the extremes of temperature and variety of climate.

The rains, which fall abundantly south of the tropic, occur from about the

middle of the month of June, to the middle or end of September; these rains are greater on the low sea-coast than on the plateau of Anahuac.

The tropical rains extend north of the tropic, but are less abundant, and fall later. On the plain of Chihuahua, and the mountain-region of Sonora the rainy season begins early in September, and lasts to the end of October, and sometimes to the middle of November. About 30 deg. north latitude the rainy season continues a month or six weeks, and the quantity that falls is less than more southerly. In the arid plain of the Rio Gila, about 32 deg. north, little or no rain falls.

With respect to climate, Mexico is divided into *tierras calientes*, hot countries; *tierras templadas*, temperate countries; and *tierras frias*, or cold countries. The first term is applied to the low coasts, the second to the districts from 4500 to 6000 feet above the sea, and the last to those which exceed in elevation 6000 feet above the sea. The *tierras frias* comprehend more than two-thirds of the surface south of the tropic; the *tierras calientes*, perhaps one-sixth; and the *tierras templadas*, still less.

At Vera Cruz, the mean annual temperature is about 77 deg.; the greatest heat prevails during, and shortly before, the rains; the thermometer usually rising to 81 deg. and 82 deg.; in December and January it falls to about 70 deg. to 73 deg., which it seldom exceeds during those months. During the prevalence of the northerly winds, which often blow strongly from October to March, the thermometer sometimes sinks to 60 deg.

On the *tierras frias* the temperature of heat and cold varies less than on the sea coast. The climate is described as that of a perpetual spring; the thermometer varying only from 10 deg. or 12 deg. The mean annual temperature in the city of Mexico being about 62 deg. The greatest heat occurs during the weeks preceding the rains, in April and May; the thermometer then rises to from 64 deg. or 68 deg. The evaporation during the rainy season diminishes the heat from 2 deg. to 5 deg. The mean temperature of the winter is about 56 deg.; and sometimes the thermometer, occasionally, but not often, descends to the freezing point, and a small quantity of snow falls. The climate of all the table and uplands is salubrious. The climate of the sea coast within the tropics may be considered generally unhealthy.

The climate of Vera Cruz and Tampico, the chief and the only ports worthy of any notice within the Gulf of Mexico, and of Acapulco on the Pacific, is remarkably fatal to human life. Alcedo, in describing the climate, soil, and productions of the province of Vera Cruz, observes:—

“It is situated under the burning sun of the tropics, and extends along the Mexican gulf, from the Rio Baraderas (or De los Lagartos) to the great river of Panuco, which rises in the metalliferous mountains of San Luis Potosi.

“There are few regions in the new continent where the traveller is more struck with the assemblage of the most opposite climates. All the west part of the intendancy of Vera Cruz forms the declivity of the *cordilleras* of Anahuac. In the space of a day the inhabitants descend from the regions of eternal snow to the plains in the vicinity of

the sea, where the most suffocating heat prevails. The admirable order with which different tribes of vegetables rise above one another by strata, as it were, is nowhere more perceptible than in ascending from the port of Vera Cruz to the table-land of Perote. We see there the physiognomy of the country, the aspect of the sky, the form of plants, the figures of animals, the manners of the inhabitants, and the kind of cultivation followed by them, assuming a different appearance in every step of our progress.

"As we ascend, nature appears gradually less animated, the beauty of the vegetable forms diminishes, the shoots become less succulent, and the flowers less coloured. The aspect of the Mexican oak quiets the alarms of travellers newly landed at Vera Cruz. Its presence demonstrates to him that he has left behind the zone so justly dreaded by the people of the north, under which the yellow fever exercises its ravages in New Spain. This inferior limit of oaks warns the colonist who inhabits the central table-land how far he may descend towards the coast, without dread of the mortal disease of the *vomito*. Forests of liquid-amber, near Xalapa, announce by the freshness of their verdure, that this is the elevation at which the clouds suspended over the ocean come in contact with the basaltic summits of the *cordillera*. A little higher, near La Banderilla, the nutritive fruit of the banana-tree comes no longer to maturity. In this foggy and cold region, therefore, want spurs on the Indian to labour, and excites his industry. At the height of San Miguel, pines begin to mingle with the oaks, which are found by the traveller as high as the elevated plains of Perote, where he beholds the delightful aspect of fields sown with wheat. Eight hundred metres higher the coldness of the climate will no longer admit of the vegetation of oaks; and pines alone there cover the rocks, whose summits enter the zone of eternal snow. Thus, in a few hours, the naturalist in this miraculous country ascends the whole scale of vegetation from the heliconia and the banana-plant, whose glossy leaves swell out into extraordinary dimensions, to the stunted parenchyma of the resinous trees!

"The province of Vera Cruz is enriched by nature with the most precious productions. At the foot of the *cordillera*, in the ever-green forests of Papantla, Nautla, and S. Andre Tuxtla, grows the epidendrum vanilla, of which the odoriferous fruit is employed for perfuming chocolate. The beautiful convolvulus jalapæ grows near the Indian villages of Colipa and Misantla, of which the tuberosc root furnishes the jalap, one of the most energetic and beneficent purgatives. The myrtle (*myrtus pimenta*), of which the grain forms an agreeable spice, well known in trade by the name of *pimenta de tabasco*, is produced in the forests which extend towards the river of Baraderas, in the east part of the intendancy of Vera Cruz. The cocoa of Acayucan would be in request if the natives were to apply themselves more assiduously to the cultivation of cocoa-trees. On the east and south declivities of the Pic d'Orizaba, in the valleys which extend towards the small town of Cordova, tobacco of an excellent quality is cultivated, which yields an annual revenue to the crown of more than 18,000,000 of francs (750,060*l.* sterling). The simlax, of which the root is the true sarsaparilla, grows in the humid and umbrageous ravines of the *cordillera*. The cotton of the coast of Vera Cruz is celebrated for its fineness and whiteness. The sugar-cane yields nearly as much sugar as in the island of Cuba, and more than in the plantations of St. Domingo.

"This intendancy alone would keep alive the commerce of the port of Vera Cruz, if the number of colonists were greater, and if their laziness, the effect of the bounty of nature, and the facility of providing without effort for the most urgent wants of life, did not impede the progress of industry. The old population of Mexico was concentrated in the interior of the country on the table-land. The Mexican tribes who, according to Humboldt, were supposed to have come from the north countries, gave the preference in their migrations to the ridges of the *cordilleras*, because they found on them a climate analogous to that of their native country. No doubt, on the first arrival of the Spaniards on the coast of Chalchiuhtecan (Vera Cruz), all the country from the river of Papaloapan (Alvarado to Huastecapan), was better inhabited and better cultivated than it now is. However, the conquerors found, as they ascended the table-land, the villages closer together, the fields divided into smaller portions, and the people more

polished. The Spaniards, who imagined they founded new cities when they gave European names to Aztec cities, followed the traces of the indigenous civilisation. They had very powerful motives for inhabiting the table-land of Anahuac. They dreaded the heat and the diseases which prevail in the plains. The search after the precious metals, the cultivation of European grain and fruit, the analogy of the climate with that of the Castilles, and many other causes of a similar description, all concurred to fix them on the ridge of the *cordillera*. So long as the *encomenderos*, abusing the rights which they derived from the laws, treated the Indians as slaves, a great number of them were transported from the regions of the coast to the table-land in the interior, either to work in the mines, or merely that they might be near the habitation of their masters. For two centuries the trade in indigo, sugar, and cotton, was next to nothing. The whites could by no means be induced to settle in the plains, where the true Indian climate prevails; and one would say that the Europeans came under the tropics merely to inhabit the temperate zone.

"Since the great increase in the consumption of sugar, and since the new continent has come to furnish many of the productions formerly procured only in Asia and Africa, the plains (*tierras calientas*) afford, no doubt, a greater inducement to colonisation. Hence, sugar and cotton plantations have been multiplying in the province of Vera Cruz, especially since the fatal events at St. Domingo, which have given a great stimulus to industry in the Spanish colonies. However, the progress hitherto has not been very remarkable on the Mexican coast. It will require centuries to re-people these deserts. Spaces of many square leagues are now only occupied by two or three huts (*hattos de ganado*), around which stray herds of half-wild cattle. A small number of powerful families, who live on the central table-land, possess the greatest part of the shores of the intendancies of Vera Cruz and San Luis Potosi. No agrarian law forces these rich proprietors to sell their *mayorazgos*, if they persist in refusing to bring the immense territories which belong to them under cultivation. They harass their farmers, and turn them away at pleasure.

"To this evil, which is common to the coast of the Gulf of Mexico, with Andalusia and a great part of Spain, other causes of depopulation must be added. The militia of the intendancy of Vera Cruz is much too numerous for a country so thinly inhabited. This service oppresses the labourer. He flees from the coast to avoid being compelled to enter into the corps of the *lanceros* and the *milicianos*. The levies for sailors to the royal navy are also too frequently repeated, and executed in too arbitrary a manner. Hitherto the government has neglected every means for increasing the population of this desert coast. From this state of things results a great want of hands, and a scarcity of provisions, singular enough in a country of such great fertility. The wages of an ordinary workman at Vera Cruz are from five to six francs (4s. 2d. to 5s.) per day. A master mason, and every man who follows a particular trade, gains from fifteen and twenty francs per day, that is to say, three times as much as on the central table-land."

Such was the description given of the country along and back from the Gulf, immediately before Mexico declared its independence of Spain.—(See Port of Vera Cruz hereafter.)

CHAPTER VIII.

ROUTE AND COUNTRY FROM VERA CRUZ TO THE CITY OF MEXICO.

IN describing Mexico according to accounts written since 1840, we are confined altogether to the works of American travellers.

Mr. Mayer, on leaving Vera Cruz, in 1841, observes:—

"It was entirely too warm, even in this middle of November, to stir out of the house with satisfaction. We, therefore, dressed ourselves in summer apparel, and took an excellent dinner very quietly, resolved not to expose our persons unnecessarily, as we understood there had been recent cases of vomito. They say that the country has been lately scoured by troops of dragoons, but that it is still infested with robbers; and, although we are to have a military escort, our friends appear to intimate that Colt's revolving pistols, double-barrelled guns, and a stock of resolution will be our best safeguards.

"At sunset, a countryman was so good as to call for us to walk with him to the *Alameda*. We sallied from the south gate, and took our way into a desolate and melancholy country. On every side were marks of solitude and misery. The ruins of houses and churches, filled with weeds and creepers; neglected fields, overgrown with aloes, and made still more sad by the long pensile branches of the solitary palm; and, over all lay the dark shadows of evening, as the last rays of the sun fell aslant on the stagnant pools. A sergeant was drilling a few recruits to the tap of the drum. The music seemed to be a dead march, and the step of the soldiers was slow and solemn. Nothing could be more dreary—more heart-sickenening. We loitered on, like the rest of folks, but there was no liveliness—no spirit. The people were not cheerful and joyous, but strolled along in silent pairs, as if oppressed by the sadness of the melancholy wastes on the one side, and the cold, dreary, illimitable sea on the other.

"The appropriate termination of this walk through the ruined *Alameda*, was the burying-ground. As we reached it, a funeral had just entered, and in the chapel they were saying some annual service for the dead! It may be wrong to indulge in such emotions, but here there really seems to be an utter *hopelessness in death*. We love to think, that when it falls to our lot to share the common fate of humanity, we shall, at least, repose near our kindred and friends, in some beautiful spot, where those we have loved shall moulder beside us, until the dust we cherished in life shall be as blent as were the spirits that animated it. We love to think that our graves will not be solitary or unvisited. But, on this dismal shore, where the Shadow of Death for ever hangs over the prospect, the grave is not a resting-place, even for tired spirits, and the soul seems to perish as well as the body!

There was a continual hubbub in the square under our windows all night long. First of all, the guard was to be set, and that produced drumming, fifing, braying of trumpets, and bustle of troops; next, my bed was too short for me; then, just as I was coaxing myself into a doze, I discovered that the servant had neglected to put down the net, and consequently, came the onset of a colony of mosquitoes, ravenous for the fresh blood of a foreigner; next, the clock on the opposite tower struck *every* quarter, and that was backed, by the watchman under the *portalis*, who prefaced his song with an 'Ave Maria Purissima' that would have waked the dead. And thus, from hour to hour, I tossed and tumbled, while the clock struck, the watchmen howled, and the mosquitoes sucked.

"One of my fellow-travellers who was anxious to avoid the risk of waiting in Vera Cruz for the diligence, informed me about ten o'clock, that he had made arrangements for a *litera* to carry him to Xalapa, there to await the stage and rejoin our party. He was so good as to offer me a part of his couch, which I eagerly accepted, and immediately set to work packing my extra baggage for the Arrieros, as the diligence, and the muleteers who accompany *literas*, will carry but a limited burden. At four the *litera* arrived, but the muleteers would allow but one passenger. There was nothing but submission. Pancho had his bundles strapped on, stepped into his vehicle, or rather stretched out on its bed, lighted his cigar, tied on a Guayaquil *sombrero*, and waved us farewell.

"During the last two days of our stay at Vera Cruz, it blew a norther. The wind was high, and made it impossible for ships to enter the port. We spent the last afternoon at the water-gate of the city, watching the waves as they spent their fury on the Mole, and the ships, anchored under the lee of the castle, tugging at their cables like impatient coursers struggling to get loose.

"After supper we made our final preparations for departure. Trunks were strapped

on the diligence, old and warmer clothing put on, and, at midnight, nine of us got into the coach for our journey to the capital.

"The stories of numerous robberies, and the general insecurity of the road, had been dinned into our ears ever since we arrived. Scarcely a diligence came in that did not bring accounts of the levying of contributions.

"It was very dark when we issued from the gates of the city, where our passports were demanded. Accustomed, of late years, to the unmolested travelling of our Union, I had put mine at the bottom of the trunk, and forgot all about the necessity of having it in my pocket. The drowsy guard, however, took my word for the fact that I had one, and permitted us to pass on.

"A warm, drizzling rain was pattering down, driven in by the norther, which was still raging and dashing the sea in long surges on the sandy beach along which our road lay for several miles. We could see nothing; the way soon became almost impassable through the deep sand, though our heavy coach was drawn by eight horses; and proposing that the curtains should be let down, at least on my side, I was soon in a profound sleep, nor did I awake until near sunrise, as we were passing the estate of Santa Anna, at Manga de Clavo. His *hacienda* was in the distance, to the right of the road, and appeared to be a long, low edifice, buried among forests, but without those signs of improvement and cultivation which make the property of our great landlords so picturesque. He owns an immense body of land in this neighbourhood, lying for *leagues* along the road, but all seemed as barren and unattractive as the wildernesses of our far west.

"During the night, an escort of three troopers had joined us at Boccherone. At daylight I caught sight of them, for the first time, in their long yellow cloaks, trotting along behind us on their small, but tough and trusty horses. They were three as poor-looking wretches as I ever saw: one of them appeared to be just out of a fit of fever; the other a little the worse for an extra cup of *aguardiente*; and the third, as though he had just recovered from a month's chattering of the ague.

"The road thus far had been tolerably good, although much cut up by the recent passage of baggage-waggons and trains of artillery. About seven o'clock we halted at the village of Manantial for breakfast. It is the usual stopping-place for the diligence, and we were of course immediately supplied with chocolate and biscuit.

"The houses in this part of Mexico are mostly built of split bamboos, set upright in the ground, with a steep roof, thatched with palm-leaves, and prepared, of course, to admit freely the sun, wind, and rain, which, during the season, is sufficiently abundant. Upon the whole, they are very respectable and picturesque *chicken-coops*.

"Here our guard quitted us. It seems, notwithstanding the written orders and promise I had from the commandant at Vera Cruz for an escort, that these fellows had received no directions to accompany us, and had only ridden thus far, because they thought the new Minister of Finance, Senor Trigueros, was in the stage. But I can hardly think they were a loss.

"We were soon called to coach, and mounting our vehicle with better spirits for the refreshment and morning air, we shortly entered a rolling country, with an occasional ruinous hamlet and plantation. Although the scenery was in spots exceedingly romantic, interspersed with upland and valley, and covered with a profusion of tropical trees and flowers, there was over the whole that air of abandonment which could not fail to strike one painfully. In a new country, as a traveller passes, by a solitary bridle-path, over the plains and hills, hidden by the primeval forests fresh as they came from nature's hand, there is matter for agreeable reflection, in fancying what the virgin soil will produce in a few years when visited by industry and taste. But here, nature, instead of being pruned of her luxuriance with judicious care, has been literally sapped and exhausted, and made old even in her youth, until she again begins to renew her empire among *ruins*. It is true, that traces of old cultivation are yet to be found, and also the remains of a former dense population. The sides of the hills, in many places, as in Chili and Peru, are cut into terraces; but over those plains and terraces is spread a wild growth of mimosas, cactus, and acacias, while a thousand flowering parasite plants trail

their gaudy blossoms among the aloes and shrubbery which fill up the rents of time and neglect in the dilapidated buildings. It is the picture of a beauty, prematurely old, tricked out in the fanciful finery of youth !

"We wound along among these silent hills until about ten o'clock, when a rapid descent brought us to the National Bridge, built by the old Spanish government, and enjoying then the sounding title of *Puente del Rey*. Changed in name, it has not, however, changed in massive strength, or beauty of surrounding scenery. Indeed, the neglect of cultivation, has permitted nature to regain her power ; and the features of the scenery are therefore more like those of some of the romantic ravines of Italy, where the remains of architecture and the luxuriant products of the soil are blent in wild and romantic beauty.

"The Puente Nacional spans the river Antigua, which passes over a rocky bed in a deep dell of high and perpendicular rocks. The adjacent heights of this mountain pass have been strongly fortified during the wars ; among their fastnesses and defiles the revolutionary generals lay concealed in Iturbide's time, and finally descended from them to conclude the fight in favour of independence.

"At Puente, there is a village containing the usual number of comfortable cane huts, before which the neighbouring Indians had spread out for sale their fruits and wares ; while the Mexicans (as it was Sunday) were amusing themselves by gambling at *monté* for *clacos*. At the inn a breakfast of eggs and frijoles was prepared for us. The eggs, the beans, the bread, and a bottle of tolerable claret went down famously, with the seasoning of our mountain appetites ; but I cannot say as much for the stew of mutton and fish fresh from the river. What with onions, and lard, and garlic, and chilé peppers, I never tasted such a mess.

"Our route westward to Plan del Rio was through a mountainous country of short and gradual ascents, in most of its characteristics resembling the one we had passed over during our morning ride. At length, a steep descent over a road as smooth as a bowling-green brought us to the village of Plan. The guard trotted after us leisurely ; the day had become cloudy and the scenery dreary, and the fear of robbers among these solitary wildernesses again came over us.

"The host at Plan del Rio received us warmly, though his house was as cold and uninviting as the day. He speedily produced a smoking dinner of fowls and rice, to which I found myself able to do but little justice. But the dinner had been served—we had tasted it—a bottle of claret had been drunk, and though our appetites had been frugal, the *nine* of us were obliged to pay two dollars each for the service ! The two fowls which made the stew, cost, at the most, a *real* each ; the rice as much, the salad grew for the planting, and the claret stood our host about seventy-five cents the bottle ; so, for what, with service and cooking and original cost, taxed our Padrone not more than three dollars at the extreme, he had the modest assurance to charge our coach-load *eighteen* !

"What with sour wine, sour spirits, and imposition, I doubt much if there was ever an angrier coach-load on any highway. We were effectually ill-tempered, and we looked to our primings with the full disposition to defend ourselves nobly. It would have fared ill with any one who had ventured to attack us during our first hour's ride. In addition to this, our road, as soon as it left the river, ascended rapidly and passed over a track which would in any other country be called the bed of a mountain stream, so rough and jagged was its surface. Although it is the duty of the government to keep this highway in order, yet as the chief travelling is on horseback, and the principal part of merchandise is transported on mules, no one cares how these animals get along. Sure-footed and slow, they toil patiently among the rents and rocks, and their drivers are too well used to the inconveniences to complain. Besides this, in case of insurrections, it is better for the roads to be in bad condition, as it prevents easy communication between the several parts of Mexico, and the disjointed stones serve to form, as they have often done, breastworks and forts for the insurgents.

"But over this mass of ruin we were obliged to jolt in the ascent of the mountain, during the whole afternoon, meeting in the course of it fifty waggons laden with heavy machinery for factories near Mexico.

"I must not forget to mention one redeeming spot in the gloomy evening. On looking back over the province of Vera Cruz, as we were near the summit of the mountain, I caught a glimpse of the plains and hills over which we had been all day toiling. The view was uninterrupted. Before us lay valley upon valley, in one long graceful descending sweep of woodland and meadow, until they dwindled away in the sands to the east, and the whole was blent, near the horizon, with the blue waves of the Gulf of Mexico. Just then the sun broke out from the region of clouds which we were rapidly approaching in our ascent, and gilding, for a moment, the whole lowland prospect, I could almost fancy I saw the sparkle of the wave crests as they broke on the distant and barren shore.

"At the village on the mountain we could get no guard. This is said to be a very dangerous pass; but the commanding officer told us he had been stationed here for two weeks, during which he had scoured the mountains in every direction, and believed his district to be free from robbers. Cigars would not avail us this time! His men were tired and he could give no escort.

"Night soon fell dark and coldly around us. In these elevated regions the air is cold and nipping; but we dared not put down our coach curtains for fear of an attack. We therefore donned our cloaks and over-coats, and laid our guns and pistols on the window-frames. John, the old gray hero, was on the look-out, with his blunderbuss, from the box, and the driver promised to have an eye to windward.

"Thus we jolted on again, at times almost *stalled*, and, in sudden smooth descents, swinging along with a rapidity in the dark and moonless night, that seemed to threaten our destruction among the rocks. Six, seven, eight, and half-past eight o'clock passed, and no robbers appeared, though there had been several false alarms. The road became worse and worse, the coach heaving over the stones like a ship in a head sea, and the driver being obliged to descend from his seat and *feel* for the track. We saw lights passing over the heath in many places, and it was *surmised* they might be the signal lights of robbers. After due consultation, it was determined *that they were!* As we approached them they proved to be fire-flies! We felt for our percussion-caps and found them all right, and, at that moment, the coach was brought to a dead halt in the blackest looking ravine imaginable.

"At half-past nine we rolled into the court-yard of an excellent inn at Xalapa, where a good meal served both for dinner and supper.

XALAPA AND PEROTE.—"When the Neapolitans speak to you of their beautiful city, they call it, 'a piece of heaven fallen to earth;'* and tell you to 'see Naples *and die!*'

"It is only because so few travellers extend their journey to Xalapa and describe its scenery, that it has not received something of the same extravagant eulogium.

"The town has about ten thousand inhabitants, and is, in every respect, the reverse of Vera Cruz; high, healthy, and built on almost precipitous streets, winding, with curious crookedness, up the steep hill-sides. This perching and bird-like architecture makes a city picturesque—although its highways may be toilsome to those who are not always in search of the romantic.

"The houses of Xalapa are not so lofty as those of Vera Cruz, and their exteriors are much plainer; but the inside of the dwellings, I am told, is furnished and decorated in the most tasteful manner. The hotel in which we lodged was an evidence of this; its walls and ceilings were papered and painted in a style of splendour rarely seen out of Paris.

"The vapour rising from the sea, driven inland by the northern winds, here first strikes the mountains; and, lodging in rain and mist and dew among the cliffs, preserves that perennial green which covers this teeming region with constant freshness and luxuriance. Xalapa is consequently a 'damp town,' yet it enjoys a great reputation for its salubrity. It is now the best season of the year; but scarcely a day passes without rain, while the thermometer ranges from 52 deg. to 76 deg., according to the state of the

*—"Un pezzo de cielo caduto in terra."

clouds and winds. As soon as the mountains have discharged their vapours, the sun blazes forth with a fierceness and intensity, increased by the reflection from every hill, into the town; as to a focus.

"Yet I saw enough to justify all the praises even of extravagant admirers. Its society is said to be excellent, and its women are the theme of the poets throughout the republic.

"After despatching our breakfast, for which we paid (together with our night's lodging and dinner) the sum of *four dollars*, we mounted the diligence at ten o'clock, prepared as usual for the robbers, and set out for Perote.

"In driving from the town we passed through the public square; and in the market which is held there I first saw in perfection the profuse quantity of tropical fruits (and especially the *chirimoya*, and *granadita*,) for which Xalapa is renowned. The market is supplied by the numerous small cultivators from the neighbourhood, the females of whom bear a resemblance to our Northern Indians, which is perhaps even stranger and more remarkable than that of the men.

"*Maize*, the great staff of life for biped and quadruped in our western world, is chiefly used in the *tortillia* cakes, of which we hear so much from Mexican travellers.

"The sellers of these tough, buckskin victuals, sit in lines along the curb of the sidewalks with their fresh cakes in baskets covered with clean napkins to preserve their warmth. There they wait patiently for purchasers; and as *tortillias*, with a little *chilé*, or red pepper boiled in lard, are indispensable at least twice a day for the mass of the people, they are quite sure of a ready sale.

"With the great mass of Mexicans there is no such thing as domestic cookery. The labourer sallies forth with his *clacos* in his pocket, and two or three of them will purchase his cakes from an Indian woman. A few steps further on, another Indian woman has a pan boiling over a portable furnace, and containing the required *beans* or *chilé*. The hungry man squats down beside the seller—makes a breakfast or dinner-table of his knees—holds out his *tortillia* spread flat on his hand, for a ladle of *chilé* and a lump of meat—then doubles up the edges of the cake sandwich fashion, and so on until his appetite is satisfied. He who is better off in the world, or indulges occasionally in a little extravagance, owns a *clay platter*. Into this he causes his frijoles, or *chilé* and meat, to be thrown, and making a spoon of his *tortillia*, gradually gets possession of his food, and terminates his repast by eating the spoon itself! There is great economy in this mode of housekeeping, which recommends itself, especially, to the tastes of old bachelors. There are no dishes to be washed—no silver to be cleaned, or cared for. Your Indian flings down his *clacos*—stretches himself to his full height—gives a valetudinary grunt of satisfaction over a filled stomach—and is off to his labour. Whether this frugality is a virtue, or the result of indolence, it is not necessary for me to stop to inquire. The reader may draw his own conclusions. But all classes are content with less physical comfort than the inhabitants of other countries. Their diet is poor, their lodging miserable, their clothing coarse, inelegant and inadequate for the climate; and yet, when the energies and intelligence of the very people who seem so supine are called into action, few men manifest those qualities in a higher degree. Let me, as an illustration, notice the arrieros, or common carriers of the country, by whom almost all the transportation of the most valuable merchandise and precious metals is conducted. They form a very large proportion of the population, yet, by no similar class elsewhere are they exceeded in devoted honesty, punctuality, patient endurance, and skilful execution of duty. Nor is this the less remarkable when we recollect the country through which they travel—its disturbed state—and the opportunities consequently afforded for transgression. I have never been more struck with the folly of judging of men by mere dress and physiognomy, than in looking at the arrieros. A man with wild and fierce eyes, tangled hair, slashed trousers, and well-greased jerkin that has breasted many a storm—a person, in fact, to whom you would scarcely trust an old coat when sending it to your tailor for repairs—is frequently in Mexico the guardian of the fortunes of the wealthiest men for months, on toilsome journeys among the mountains and defiles of the inner land. He has a multitude of dangers and difficulties to contend with. He overcomes them all—is never robbed and never robs—and, at the appointed day, comes to your door with a

respectful salutation, and tells you that your wares or moneys have passed the city gates. Yet this person is often poor, bondless, and unsecured—with nothing but his fair name and *unbroken word*.

“I regret that I have been able to give only the faintest pencilling outline of Xalapa, which, with all its beauty, has doubtless hitherto been associated most nauseously in your mind with the drug growing in the neighbourhood to which it has given its name.*

“A beautiful scene, embracing nearly the whole of this little Eden, broke on me as we gained the summit of the last hill above the town. A dell, deep, precipitous, and green as if mossed from the margin of a woodland spring lay below me, hung on every side with orange trees in bloom and bearing, nodding palms and roses and acacias, scenting the air with their fragrance, and peering out among the white walls of dwellings, convents, and steeples. In the next quarter of an hour, the mists that had been gathering around the mountains, whirled down on the peaks along which we were travelling, and as the wind occasionally drifted the vapour away, we could see around us nothing but wild plains and mountain spurs covered with volcanic *débris*, flung into a thousand fantastic forms, among which grew a hardy race of melancholy-looking pines, interspersed with fallen trunks, aloes, and *agaves*. Thus the road gradually ascended among desolation, until we reached a height where the clouds were lodged on the mountain tops, and a cold drizzling rain filled the air. In this disagreeable manner, travelling among the clouds, we reached the village of St. Michel, and afterward La Hoya, over a road paved with basalt. From the latter place the scenery is described as magnificent when the day is clear, and the sun is out in its brilliancy. The vapour is said to be then spread out below you like a sea, and the mountain tops and little eminences peer above it like so many islands.

“We passed through the village of ‘Las Vigas,’ described by Humboldt, as the highest point on the road to Mexico. The houses in this neighbourhood are of different construction from those below the mountains, and are built of pine logs, each tree furnishing but one piece of timber of four inches thickness, and the whole width of its diameter; these are hewn with the axe, and closely fitted. The floors of the dwellings are laid with the same material, and the roofs are shingled. As the houses indicate a colder climate than the one through which we have recently travelled, so does also the appearance of the people, who are hardier and more robust than the inhabitants of the plains skirting the sea.

“After winding along the edge of the mountain for some hours, we obtained an occasional view of the plain of Perote, level as the ocean, and bounded by the distant mountains. The Peak of Orizaba again appeared in the south-east, while the Coffre of Perote towered immediately on our left, and, seemingly in the midst of the plain, rose the Peak of Tepiacualca. Beyond it, on the remotest horizon, was sketched the outline of the snow-capped mountains. All these plains have doubtless been the basins of former lakes; but they now appear dry and arid, and it is not easy to distinguish how far they are cultivated at the suitable season. During the summer, they present a very different prospect, and, losing the guise of a waste moor, only fit for the sportsman, put on a lively livery of cultivation and improvement, far more agreeable than the dark and thorny maguey and the wilted foliage of dwarfish trees, with which they are now mostly covered. We occasionally see the stubble of last year, but the chief agriculture is evidently carried on upon the slopes and rising ground, where the irrigation is more easy from the adjacent mountains, and is not so rapidly absorbed as in the marshy flats.

“We had not travelled this road without our usual dread of thieves. Our guns were constantly prepared for attack, and we kept a wary watch, although during nearly the whole day we were accompanied by a party of lancers, who clattered along

* To give you an idea of the profusion of fruit in Xalapa, I will state a fact. I gave a French servant a *real* (twelve and a half cents) to purchase me a few oranges, and in a short time he returned with a handkerchief bursting under the load—he had received *forty* for the money.

I told the story to a Xalapanian with surprise: “They cheated him,” said he; “they should have given him nearly double the number.”

after us on nimble horses. Some leagues from Perote we approached the 'Barranca Secca,' a noted haunt of the *ladrones*; and, as we came within gunshot of the place, a band of horsemen dashed out from the ruins of an old *hacienda* on our right and galloped directly to the carriage. The mist had again come down in heavy wreaths around us, obscuring the prospect at a dozen yards' distance; and the guard of troopers had fallen considerably in the rear. What with the fog and the dread of our foes, we were somewhat startled—cocked our weapons—ordered the coach to stop—and were half out of it, when the lancers reined up at full tilt, and after a parley with the new comers, assured us that they were only an additional troop kept here for security. I questioned, and still doubt the truth of this story, as I never saw a more uncouth, or better mounted, armed, and equipped set of men. Their pistols, sabres, and carbines were in the best order, and their horses staunch and fleet; but they may have composed a band of old well-known robbers, pensioned off by the government as a guard; and willing to take regular pay from the authorities, and gratuities from travellers, as less dangerous than uncertain booty with constant risk of life.

"Accompanied by these six suspicious rascals and the four lancers, we quickly passed the wild mist-covered moor, and entered the Barranca, a deep fissure worn by time and water into the plain, and overhung, on all sides, by lofty trees, while the adjacent parts of the flat country are cut up into similar ravines, embowered with foliage. With all the aids of art, the thieves could not have constructed a more suitable covert; and, to add to our dismay, soon after entering the Barranca, our coach broke down!

"We tramped about in the mud while the accident was repairing, and the guard and its auxiliaries scoured the pass. The quarter of a mile through which the ravine extended was literally *lined with crosses*, marking the spot of some murder or violent death. These four or five hundred *mementos mori*, seemed to convert it into a grave-yard; while the broken coach, the dreary day, shrouding mist, approaching night, and savage figures in the scene, made a picture more fit for a Trappist than a quiet traveller fonder of his ease than adventure.

"We were, however, soon again in our vehicle, and for an hour afterward the country gradually ascended, until, at sunset, the sky cleared off, and we entered Perote by a brilliant starlight.

PEROTE, a small town, containing not more than 2500 people, is irregularly built; the houses are of one low and dark story, built with strong walls around large court-yards. In the middle of the town there is a large square, abundantly supplied by fountains with pure water from the neighbouring hills.

"The *Meson* is at the further end of the town, and encloses a spacious court-yard, around which on the ground-floor (which is the only floor) are a number of brick-paved, windowless stalls, furnished with a bed, a couple of chairs, and a table. No landlord made his appearance to welcome us. We waited a considerable time in the court-yard for his attendance; but as we received no invitation, S—— and myself got possession of a consumptive-looking candle, and sallied out to hunt for lodgings. We took possession of one of the dens I have described, and sent in our luggage; and carefully locking the door afterwards (as Perote is the head-quarters of villany, and the court-yard was full of unshaved, ill-looking devils wrapped up in blankets).

"On one side of the gateway is the *fonda*, or eating part of the establishment, where two or three women were employed cooking sundry strange-looking messes. We signified our hunger, and were soon called to table. Several officers of the garrison, as well as the stage-load coming from Mexico, were then before us. The cooking had been done with charcoal, over furnaces, and the colour of the cooks, their clothes, the food, and the hearth, was identical; a warning, as in France, never to enter the kitchen before meals. The meats had been good, but were perfectly bedevilled by the culinary imps. Garlic, onions, grease, chilé, and other nasty compounds, had flavoured the food like nothing else in the world but Perote cookery. We tasted, however, of every dish, and that taste answered to allay appetite if not to assuage hunger; especially as the tablecloth had served many a wayfarer since its last washing (if it had ever been washed), and had, besides, doubtless been used for duster (if they ever dust). The waiter, too, was a

boy, in sooty rags, who hardly knew the meaning of a plate, and had never heard of other forks but his fingers.

"Disgusted, as you may well suppose we were, with this supper, I did not remain long at table. We were a set of baulked hungry men, and withal, tired and peevish. I put my face for a moment outside of the gate, to take a walk, as the night was beautiful; but S—— pulled me back again, with a hint at the notorious reputation of Perote. It was not eight o'clock, but the town was already still as death. Its population had slunk home to their cheerless dwellings, and the streets were as deserted as those of Pompeii, save where a ragged rascal now and then skulked along in the shadow of the houses, buried up in his broad-brimmed sombrero and dirty blanket.

"We, therefore, at once retired to our cells; I threw myself on the bed wrapped in my cloak, in dread of a vigorous attack from the fleas, and slept without moving until the driver called us at midnight to start for Puebla.

"In half-an-hour, we were once more in the coach galloping out of the town, followed by three dragoons furnished by the officer we had met at supper, who seemed to entertain as poor an opinion as we did of this citadel of vagabondism.

"Although the sky had been clear, and the stars were shining brightly when we retired to bed, a mist was now hanging in low clouds over the plain. The road was, however, smooth and level; and we scampered along nimbly, fear adding stings to our coachman's lash, inasmuch as he was the driver of a diligence that had been robbed last spring, and had received a ball between his shoulders, from the effects of which he had just sufficiently recovered to drive on his first trip since the conflict. We galloped during the whole night, stopping only for a moment to change horses; nor did we meet a living thing except a pack of jackals, that came bounding beside the coach along the level and almost trackless plain. I never saw half so frightened a man as our coachman, especially when we passed the spot where he had been wounded. Every shrub was a robber—and a maguey of decent size was a whole troop!

"The early morning, from the rain which had fallen during the night on this portion of the plain, was as cold and raw as November at home; nor was it until an hour after sunrise that the mists peeled off from the lowlands, and, folding themselves around the distant hills, revealed a prospect as bare and dreary as the Campagna of Rome.

CITY OF PUEBLA.—"From Perote to Puebla, the road led among deep gulleys, and was exceedingly dusty on the plains. The towns were usually built of the common *adobes*, or sun-dried bricks of the country, and neither in their architectural appearance, nor in the character of their inhabitants, offered any attractions for the attention of a traveller. It was, indeed, a tedious and uninteresting drive over the solitary moors, and I have seldom been more gratified at the termination of a day's fatigue than I was when we entered the gateway of our spacious and comfortable inn at Puebla. In addition to the usual discomforts of the road, we had suffered greatly from the heat during the two or three last hours of our ride, and were annoyed by a fine dust, which, heated by a blazing sun, rolled into our coach from every side, and fell like a parching powder on our skins. A bath was, therefore, indispensable before the dinner, which we found excellent after our fare of the previous night at Perote. In the afternoon I paid a visit to the governor, who promised an escort of dragoons for the rest of the journey to the capital; and I then sallied forth, to see as much as possible of this really beautiful city.

"My recollections of Puebla (comparing it now with Mexico) are far more agreeable than those of the capital. There is an air of neatness and tidiness observable everywhere. The streets are broad, well-paved with flat stones, and have a washed and cleanly look. The crowd of people is far less than in the capital, and they are not so ragged and miserable. House rents are one-half or one-third those of Mexico, and the dwellings are usually inhabited by one family; but, churches and convents seem rather more plentiful in proportion to the inhabitants. The friars are less numerous, and the secular clergy greater.

"A small stream skirts the eastern side of Puebla, affording a large water-power for manufacturing purposes. On its banks a public walk has been planted with rows of trees, among which the paths meander, while a neat fountain throws up its waters in the midst

of them. The views from this retreat, in the evening, are charmingly picturesque over the eastern plain.

"On the western side of Puebla lie the extensive piles of buildings belonging to the Convent of St. Francis, situated opposite the entrance of the *Alameda*—a quiet and retired garden walk to which the *cavaliers* and *donzellas* repair before sunset, for a drive in view of the volcanos of Istazihuatl and Popocatepetl, which bound the westward prospect with their tops of eternal snow. Near the centre of the city is the great square. It is surrounded on two sides by edifices erected on arches through which the population circulates as at Bologna. On the northern side is the palace of the governor, now filled with troops; and directly in front of this is the cathedral, equal, perhaps, in size to that of Mexico, but, being elevated upon a platform about ten feet above the level of the square, it is better relieved and stands out from the surrounding buildings with more boldness and grandeur.

"To the right of the altar is the gem of the building. It is a figure of the Virgin Mary, nearly the size of life. Dressed in the richest embroidered satin, she displays strings of the largest pearls hanging from her neck below her knees. Around her brow is clasped a crown of gold, inlaid with emeralds of a size I had never seen before; and her waist is bound with a zone of diamonds, from the centre of which blaze numbers of enormous brilliants!

"But this is not all. The candelabras surrounding the platform before the altar, are of silver and gold, and so ponderous that a strong man could neither move nor lift them. Immediately above the altar, and within the columns of the large temple erected there, is a smaller one, the interior of which is displayed or concealed by secret machinery. From this the *Host*, amid a blaze of priceless and innumerable jewels, is exhibited to the kneeling multitude.

"As I went out of the door in the dim twilight, and found a miserable and ragged woman kneeling before the image of a saint, and heard the hollow sounding of her breast as she beat it with penitential fervour, I could not help asking myself, if the church that subsisted upon alms, in order to be the greatest almoner of the nation, had fulfilled its sacred charge while there was one diamond in the zone of the Virgin, or one homeless and foodless wretch in the whole republic.

PUEBLA TO MEXICO.—"Soon after our departure from Puebla,* we crossed a small stream spanned by a fine bridge, and commenced ascending by a very gradually inclined plain toward the Sierra Nevada. The mountains on our left are a stupendous range, standing out sharply against the bright blue sky, in the clear early light and pure atmosphere, their lower portions covered with dark pine forests, from which the conic peak of Popocatepetl, with its eternal snow, emerges majestically; while, further north, towers its gigantic rival, Iztaccihuatl. Between us and the mountains is the Pyramid of Cholula. As we approach this elevated region, the country becomes well watered, and the plain is just sufficiently inclined for irrigation; the soil rich, the estates extensive, and cultivated with the greatest care. Immense herds of cattle are spread over the fields, and the land, now preparing for the winter crops, is divided into extensive tracts of a thousand acres,

* It is not over two or three hundred yards from the gates of Puebla, where most of the robberies of which I afterwards heard during my residence in Mexico, occurred. A band of some five, ten, or a dozen men, armed, with their faces covered with crape, usually stood waiting in the early dawn, for the diligence. If there were *armed foreigners* in the coach, they would look in, consult a moment, and then ride off. If the passengers were unarmed, and the boot of the vehicle looked heavy and tempting, the result was the perfect sacking of the whole company. Their persons were first robbed and partially stripped as they descended from the door; they were then made to lie down with their mouths on the ground—and their trunks were rifled. One lady, the present prima donna of the Opera in Mexico, lost 600 dollars in doubloons and jewels, at this very spot—notwithstanding a guard had been promised by the authorities, and paid for. The instances, however, were innumerable and unpardonable, while regiments of cavalry dozed, within a quarter of a mile, in a city almost under martial law.

While I resided in the capital, during Santa Anna's vigorous administration, he had some sixty five or seventy *garrotted*. Two or three every week. This for a time struck terror into the band, but I learn that lately they have again taken to the road with renewed vigour.

along which the furrows are drawn with mathematical accuracy. Among these noble farms a multitude of habitations are scattered, which, enclosing the numerous population necessary for labour, with the requisite chapels, churches, and surrounding offices, gleam out brightly with their white walls from among the dark foliage of the groves, and impress one as favourably as the multitude of tasteful villages that dot the windings of our beautiful Connecticut.

"We breakfasted hastily at San Martin, and for the next league our ascent was almost imperceptible. At length, we crossed several fine streams, and the road, rising rapidly, struck more into the mountain. There was no longer any sign of cultivation, even in the dells, but the dense forest spread out on every side its sea of foliage. The road was as smooth as a bowling-green, and we swung along over the levels, up hill and down, until we passed the Puente de Tsmeluca, over a stream dashing from a mountain ravine like a shower of silver from among the verdure. After again ascending another mountain, and following its descent on the other side, we reached the village of Rio Frio, a collection of the miserable huts of coal-burners, and the nest and nursery of as fierce a brood of robbers as haunt the forests. In proof of this, and, moreover, that the cross, in this land, is no *sign of redemption*, the sacred emblem was again spread out on every side, as yesterday in the Barranca Secca, marking the grave of some murdered traveller. We were once more in the fields of romance and robbery; yet, well guarded to-day by a vigilant troop, and in good spirits at the near termination of our trials, we again launched forth for our final ride. Leaving this narrow and desolate ravine among the hills, the road once more ascends by a series of short windings through the pine woods, among which the wind whistled cold and shrill as over our winter plains; and, thus gradually scaling the last mountain on our route, while the increased guard scoured the recesses of the forest, we reached the lofty summit in about an hour, and rolled for some distance along a level table-land, catching glimpses, occasionally, of a distant horizon to the west, apparently as illimitable as the sea. The edge of the mountain was soon turned, and as the coach dipped forward on the descent of the western slope, a sudden clearing in the forest disclosed the magnificent Valley of Mexico.

VALLEY OF MEXICO.—"I am really afraid to describe this valley to you. I have seen the Simplon—the Spleugen—the view from Rhigi—the 'wide and winding Rhine'—and the prospect from Vesuvius over the lovely bay of Naples, its indolent waves sleeping in the warm sunshine on their purple bed—but none of these scenes compare with the Valley of Mexico. They want some one of the elements of grandeur, all of which are gathered here. Although the highest triumphs of human genius and art may disappoint you, *Nature never does*. The conceptions of Him who laid the foundations of the mountains, and poured the waters of the seas from His open palm, can never be reached by the fancies of men. And if, after all, the exaggerated descriptions of St. Peter's and the Pyramids, we feel sick with disappointment when we stand before them, it is never so with the sublime creations of the Almighty.

"Conceive yourself placed on a mountain, nearly 2000 feet above the valley, and 9000 above the level of the sea. A sky above you of the most perfect azure, without a cloud, and an atmosphere so transparently pure, that the remotest objects at the distance of many leagues are as distinctly visible as if at hand. The gigantic scale of every thing first strikes you—you seem to be looking down upon a *world*. No other mountain and valley view has such an assemblage of features, because nowhere else are the mountains at the same time so high, the valley so wide, or filled with such variety of land and water. The plain beneath is exceedingly level, and for 200 miles around it extends a barrier of stupendous mountains, most of which have been active volcanoes, and are now covered, some with snow, and some with forests. It is laced with large bodies of water, looking more like seas than lakes; it is dotted with innumerable villages, and estates, and plantations; eminences rise from it, which, elsewhere, would be called mountains, yet there, at your feet, they seem but ant-hills on the plain; and now, letting your eye follow the rise of the mountains to the west (near fifty miles distant), you look over the immediate summits that wall the valley, to another and more distant range—and to range beyond range, with valleys between each, until the whole melts into a vapoury distance, blue as the cloudless sky above you.

"Yet, one thing was wanting. Over the immense expanse there seemed scarce an evidence of life. There were no figures in the picture. It lay torpid in the sunlight, like some deserted region where Nature was again beginning to assert her empire—vast, solitary, and melancholy. There were no sails—no steamers on the lakes, no smoke over the villages, no people at labour in the fields, no horsemen, coaches, or travellers but ourselves. The silence was almost supernatural; one expects to hear the echo of the national strife that filled these plains with discord, yet lingering among the hills. It was a picture of 'still life,' inanimate in every feature, save where, on the distant mountain sides, the fire of some poor coal-burner, mingled its blue wreath with the bluer sky, or the tinkle of the bell of a solitary muleteer was heard from among the dark and solemn pines.

"What a theatre for the great drama that has been performed within the limits of this valley! When Cortez first stood upon these mountains, and looked down on the lovely scene, peaceful then and rich under the cultivation of its Indian children; and hills and plains covered with forests, and much of what is now dry land hidden by the extensive lake, in the midst of which rose the proud city of the Aztec kings, filled with palaces and temples; in site, another Venice on its inland sea; in art, the Indian Attica: when he beheld, I say, this tranquil scene at his feet, what must have been the avarice and the relentlessness of an unknightly heart that urged him onward to the destruction and enslavement of a civilised and unoffending people, whose only crime was, the possession of a country rich enough to be plundered to minister to the luxury of a bigoted race beyond the sea!

"Our descent commenced from the eminence where we had halted awhile to survey the valley. Our coachman was an honest Yankee, fearless as the wild horses he drove, and they scoured along under his lash as if we had the level roads of New England beneath us. But, alas! we had not. I question whether there are any such roads elsewhere, in the world; nor can you conceive them, because your experience among the wilds of the Aroostook or the marshes of the Mississippi, can furnish no *symptoms* of such highways. They were gulleys, washed into the mountain side by the rains; filled, here and there, with stones and branches; dammed up, to turn the water, by mounds a couple of feet high; and thus, gradually serpentineing to the foot of the declivity. You may readily imagine that there was no such thing as *rolling* down with our rapid motion over such a ravine. We literally *jumped* from dam to dam, and rock to rock, and in many places where the steep is certainly at an angle of 45 deg., I must confess that I quailed at the impending danger, while the horses bounded along as fiercely as if they bore Mazeppa. But the driver knew what he was about, and in an hour drew up at the Venta de Cordova, where, when I alighted, I found myself deaf and giddy from the heat, dust, and irregular motion. In a few moments, however, the blood poured from my head, and I was relieved, though I felt ill and uncomfortable the rest of the day. Two of the other passengers suffered in the same manner.*

"The succeeding distance of about thirty miles lies along the level, and skirts a detached range of volcanic hills between the lakes of Texcoco and Chalco, the same which I described, some time ago, as rising like ant-heaps from the plain. We passed the village of Ayotla, and through a number of collections of mud-walled huts and desolate hovels, buried up among palm-trees and fields of barley and maguey (resembling the streets of ruined tombs near Rome); but nowhere did I see any evidence of neat or careful cultivation, or of comfort and thriftiness. In this the valley of Mexico is, markedly, different from that of Puebla. Misery and neglect reigned absolute, Squalid Indians in rags, exhibiting almost entirely their dirty bodies, thronged the road; miserable devils coming from market; children, half-starved and naked, and women whose wiry and uncombed hair gave them the mien of porcupines.

"At length, as we gained the top of a little eminence, our driver pointed out the

* Almost all travellers suffer from giddiness and flow of blood to the head on their arrival on the Valley of Mexico. This arises from the great rarefaction of the atmosphere, 7500 feet above the level of the sea.

'City of Mexico:—a long line of turrets, and domes, and spires, lying in the lap of beautiful meadows, and screened, partially, by intervening trees, planted along the numerous avenues leading to the capital. About two leagues from the city we came to the ancient border of the Lake of Tezcoco, now a marshy flat from which the waters have receded. Here we mounted the *calzada*, or causeway, raised above six feet above the surrounding waters.

"This road is not one of the ancient avenues by which the city was approached, across the lake, during the reign of the Indians, but was constructed at great expense by the old Spanish government. Although the land to the north of it is covered with *saline* particles that are perfectly visible as you ride along, yet the southern flats, being watered by the fresher stream from Chalco, which flows through several apertures of the dike, are in no manner discoloured. The northern marsh was covered with myriads of ducks, and looked as if it had been literally *peppered* with wild fowl. The birds are murdered in immense quantities with a sort of infernal machine, formed by the union of a great number of gun-barrels, and they furnish the chief food of the poor of Mexico.

"Thus, about four o'clock, we passed this unprepossessing approach to the capital, driving by the body of a man who had just been murdered, lying on the road-side, with the blood flowing from his recent wound. Hundreds passed, but no one noticed him. At the gates we were detained only a moment for examination, and we entered the city by the Puerto de San Lazaro. A saint who suffered from impure blood, and presides over sores, may well be the patron of that portal and portion of the suburbs through which we jolted over disjointed pavements, while the water lay green and putrid in the stagnant gutter, festering in the middle of close streets, swarmed with ragged thousands. As I looked at them from our window, they seemed more like a population of witches, freshly dismounted from their broomsticks, than any thing else to which, in fancy, I can readily compare them.

"But the journey ended as we drove to the hotel Vergara, where a dirty court-yard, filled with sheep, chickens, horses, bath-houses, and a blacksmith's shop, received our jaded crew. I found that a kind friend had already prepared rooms for me, where, after a bath and dinner, I was made as comfortable as possible, by the attentions of a hospitable landlady."

Mr. Gilliam, who travelled from Vera Cruz in a clumsy-wheeled carriage called a *diligencia*, but who says he neither understood Spanish nor French, confirms the truth of Mr. Mayer's "Descriptive Sketches," and he dwells on the attacks of robbers, the extravagant charges, and bad accommodation on the road—ten dollars being the charge for conveying a trunk from Vera Cruz to the City of Mexico. The journey by the *diligencia*, dragged by eight horses, was agreed to be performed in eighteen days; fifty dollars for each person was the fee charged; they were escorted by a troop which Mr. Gilliam considered as suspicious as the *Ladrones*. He admits that parts of the old road were in good condition, and "looked to him like a well-improved street," and expresses his impatience to escape from the *Tierra caliente* and the *malaria vomito*. He complains of the "half-done frijoles" (black beans) and "half-done fowls," as food which no human being could eat; and says, an old Belgian doctor was so disgusted with half-cooked chickens, "that, in self-defence, he lived on little monkeys." He speaks of the temperate region, *tierra templada*, in contrast "with the gay sultry region of many-blossoming flowers, that border the sea," as abounding in a more stately growth of forest, "for with the varieties of the musquite and the liquid amber, I now beheld the tall cypress; and as the *diligencia* would now and then wind down some craggy steep into a deep glen,

where my ears would be stunned by the wild screams of the parrots, and all the other beautifully-plumed feathered tribes, it was only necessary to ascend the opposite height to be transported again to the *tierra templada*, there to perceive the forest a perfect medley, from its being indiscriminately mixed, and the whole wood so thickly matted and entwined, being apparently impervious to the footsteps of animals, with a scrubby bushy growth of deepest green colour, which universally makes the eye delight to dwell upon it." He describes the region he travelled over as volcanic, and all visible rocks as lava. *

At XALAPA, said to be the most beautiful and agreeable town in Mexico—the place to which the Vera Cruzians retreat from the *vomito*—"perpetual spring," he says, "has her reign there, and vegetation, therefore, is ever verdant and blooming." Mr. Gilliam in describing this town, says, "that which I chiefly delighted in while at Xalapa was, the pleasing sight of the ladies, whose beauty seemed to partake of the eternal blossoming of their native region; for *smiling loveliness* appeared to have *positively delighted to dwell on their symmetrically angelic countenances, and while they could often be seen peering from behind the grated windows, adorned with flowers, yet no blossom was half so lovely as the sweet rose that bloomed under the delicate brunette hue of their cheeks.*"

On ascending to the Plain of Perote, which at the conquest was covered with a forest, Mr. Gilliam says, "to my view it presented not a single tree or spontaneous shrub; all appeared a cold, dry, barren waste, in the midst of which, at an elevation of between seven and eight thousand feet above the sea, sat the dark and dreary-looking Castle of Perote—a state prison." He passed, in his route, numerous "*ranchos*, the miserable open huts inhabited by Indians, the indolent, and the poor." Now and then a hacienda, or "a farm of vast extent, covered with green verdure, having multitudes of flocks feeding upon it, and attended by herdsmen and shepherds, *which would forcibly recall to the mind of any individual the days of the Latins so poetically described by Virgil in his Georgics!!*" "Generally of near proximity to the hacienda would be a pueblo (village), built of sun-burnt bricks, and having also its costly church of lofty towers." "In one or more of the deep valleys of Perote, I saw that the improved American ploughs were used for tillage, and a wealthy Mexican, a noble benefactor of his people, had at one time made a large importation of these ploughs. But one of the glorious revolutions of Mexico was *coeval* with the beneficence of the good citizen, and his ploughs shared a scattered and ruinous fate." "The plough universally used in Mexico is the instrument handed by the Romans to their posterity." "Pueblo de los Angeles," he observes, "is said to contain above 100,000 inhabitants." "In passing the ranges of the Popocateptl and Iztaccihuatl, I was pleased to see that the mountains were covered with a grove of timber of good size, for I there saw

oaks and pines of the same dimensions that I had beheld in Old Virginia." He everywhere passed "crosses of melancholy bearing, being memorials erected over the bones of murdered human beings, and thus consecrated." The meson, or Mexican road tavern, afforded a "cup of chocolate which had been boiled, and frothed by the hands of a beautiful Mexican girl." He met crowds of *arrieros*, with their *cargoes* on packed mules, loaded with the second indemnity from the Mexican to the United States government. But Mr. Gilliam does not experience the "realisation of the sublimity of the scene as the climax of the mountain had been attained," from whence "the far-famed valley of Mexico was then opened out before our view, like a map; and, indeed, it was a lovely and magnificent sight to behold." He says of the plain or valley of Mexico—

"I could only admire the extensive fields spread out before me, for the Valley of Mexico is justly renowned for its fertility, all the lands are said to be capable of cultivation by irrigation, from the abundance of water afforded from streams and lakes. Thus, whilst I might, upon the right hand, be pained to see the sterileness of a tract of country made so perhaps by the neglect of its opulent owner, and appropriated as a common for grazing, on the left I would be greeted with the pleasing prospect of miles of extent, and as far as the eye could reach, of lands cultivated alone in maize, or Indian corn; and while now I would arrive at verdant nooks, with acres of land cultivated in *chilé* or Indian pepper, of which the inhabitants make considerable use,—and I was informed that a single individual, from one crop of *chilé* alone realised the immense sum of fifty thousand dollars—and then I would come upon the green and flowery fields, cultivated to feed the cochineal insect. But what the more attracted my attention was the deep green, wide-spreading aloe, called by the Mexicans, *maquey*. This plant has, in its perfection, a stem shooting up to ten or fifteen feet in height, with an appearance of clustered flowers at its top; when ripe, the stem or stalk, of a liquid pithy substance, is consumed in a raw state by the natives. But such being the variety of the uses to which this spontaneous plant is appropriated by the Mexicans, I shall speak of its multifarious properties and consumption when my longer travels and residence in the country will better enable me to describe them.

"The view of the Valley of Mexico is certainly beautiful and grand, and but for the painful absence of timber, and the vast sterility of much of its territory, might perhaps be the most magnificent sight any where to behold upon the face of the globe. There is no country in the world, from the best information I could obtain, where individual citizens hold as large bodies of land as in Mexico, and it is estimated that from seven millions of inhabitants in all probability less than five hundred thousand are the owners of all the *terra firma* of that rich country."

Mr. Gilliam departed from the city of Mexico on the 8th of January, 1844, on his route northward for St. Francisco, as consul there from the United States, by the diligence for Lagos; he dined the first day at Tula, on Mexican cookery, scorched his throat with *chilé*, slept in the castle of a hacienda, and traversed the Plain of Gueretaro—a hot country with orange and other fruit-trees in bearing.

Gueretaro situated in a ravine, with 10,000 inhabitants, is "a cotton-manufacturing city, and one of the most improved towns in the republic. One cotton factory is owned by an enterprising American gentleman. Gueretaro is famed also for its revolutionary efforts." Mr. Gilliam, from the reports of robberies and *Ladrones*, travelled with, "in each of his breeches' pockets, a six-barrelled pistol, and on his side a good bowie knife." The

towns and haciendas he found garrisoned by Santa Anna. In the streets of Gueretaro, at night, soldiers and priests abounded; the Plaza, with its fountains were lighted up by blazing torches; and groups of people were selling fruits.

He passed through Salamanca, another cotton-manufacturing town, where the machinery was moved by animal power, and cotton cloth which cost $37\frac{1}{2}$ cents to produce, could be made in the United States for $12\frac{1}{2}$ cents. He notices everywhere the supreme authority of the priests, and the universal superstitious observances. He complains of the scrutiny at the internal customs' barriers.

He passed through the town of Guanajuato, celebrated for its productive silver mines, with much gold in the silver, but not now so extensively worked as formerly. From Guanajuato the road was good. He passed several good-looking towns, especially Silao, with 4000 inhabitants; Leon, with several handsome churches; Lago, situated on the largest river he had seen in Mexico, about 400 miles from the capital.¹ Here he met a party of Americans on their way to San Blas, to establish a cotton manufactory,—they were accompanied by their *ladies*. Each man was mounted on a good spirited horse and saddle, with four pistols in the holsters, a double-barrelled gun, &c.

At Lagos, which is conveniently situated, there were "two mills for grinding wheat—the only ones he saw in any town in Mexico." Vegetables were abundant. The houses were painted outside and inside with representations of vineyards, gardens, landscapes, &c. From this place he travelled in a *carretella*, a kind of waggon or coach, hired from a priest. Crossed the plain of La Villota. North of Lagos, the old Spanish road, though not repaired, was still good.

The hacienda of Pennuelles, north of Villota, where he was refreshed with chocolate, had a commodious house and outhouses. The proprietor was a great wheat grower. Inspected his fields, which were of great extent.

At the town of Arqua, containing 4000 inhabitants and formerly prosperous, he met an Italian opera company from Mexico. The town was well-built, and contained numerous squares and churches. He also met waggons belonging to a French merchant residing at Chihuahua, driven by Americans. The waggons had been built in the United States, and made journeys from Chihuahua (1000 miles) to the city of Mexico; also from Santa Fé (2000 miles). The American waggon is admirably adapted for such journeys; the Mexican waggon, on the contrary, is the most rude, clumsy-wheeled carriage possible, and is drawn by from eight to twelve oxen.

Mr. Gilliam considers the Mexicans degenerating in all that regards carriages, implements, harness, &c. Before reaching Zacatecas, he passed the hacienda of San Jancinto, placed in the centre of Indian corn-fields several miles in length and breadth—with wheat and other crops. Further onward, at the hacienda

of Del Refugio, he observed herds of sheep, numbering several thousands: and on advancing north, herds of all kinds were seen.

At Zacatecas, religious processions were numerous, and the bells of the churches were perpetually ringing. The streets were crooked and narrow. On leaving that town, Mr. Gilliam considered he would be fortunate, if he escaped being murdered by "the lawless Mexicans who infest the highways, or by the merciless Cumanches."

He accuses other nations of egotism, and he tells the Mexicans that "in the timely moment, the angry war-spirited eye of the United States is more to be feared than disregarded."

He describes the *Alemada* of Zacatecas as a lovely, romantic place. Misdemeanours are punished by subjecting the offenders to hard labour on the streets and highways. They are manacled two and two; and he calls them "the united brethren."

In the *Mesons* (inns) the boarders do not dine together: each sends or goes for his meals to the *fonda* at any hour. The poor, when they die, are buried without coffins, and naked. The price of iron, on account of the protective system, is more than one shilling the pound weight.

On travelling north from Zacatecas, he engages an United States citizen as interpreter, who cheats him, and would have betrayed and murdered him.

The ascent from Zacatecas over the Malanoche is by a road constructed under an English engineer, and the labour was performed by criminals. He says the Mexicans never wash when travelling. He had numerous encounters with the Indians on the Madre Monte, and had various escapes and adventures before arriving at Canales.

The following abstracts are descriptive of the country, and especially the silver-mining districts between Zacatecas and the north-western termination of Mr. Gilliam's journey to near the Gulf of California:—

"The hacienda Paras, signifying a vine, was the only estate in Mexico where the grape was permitted to be cultivated by the King of Spain. It was, previous to the revolution, the property of a Spanish nobleman, but after the independence of Mexico, he sold it to a Spanish house in the city of Mexico, and then it was resold to the house of Staples and Co., of the same city. The Barings of London, afterwards became the purchasers, but were prevented from holding the property by the Deputies of Mexico passing a law preventing foreigners from buying or selling lands in that country; and it is said that the speculations of the hacienda Paras gave origin to the passage of that act. This estate, I was credibly informed, besides the extensive vineyards, producing many thousand gallons of wine and alcoholic liquors, possessed, when the Barings purchased it, upwards of three hundred thousand head of sheep, with a corresponding proportion of other stock.

"SILVER MINES OF ZACATECAS.—As we gradually ascended the plain to the mountains of Zacatecas, we were exposed to a heavy cold wind, that swept over the face of the earth, unimpeded by forest. I was sometimes diverted by the Mexicans in the fields, whose loose serapis would, by the violence of the winds, float from their shoulders like the wings of so many *zopilotes*, buzzards, as if the natives would be flown away with.

"At about three o'clock in the evening, my American companion pointed out to me the rich mountains of Zacatecas, in a deep gorge of which was built the city of the same name. The American had, during his residence in Mexico, been engaged in mining at that place, and could, therefore, from his perfect acquaintance with it, minutely trace out, for my understanding, a vein of silver ore, the only instance of the kind known in the world, which rose to the surface of the plain, and with precision follow its ascent up the mountain, and describe the visible walls and buildings, where shafts had been sunk upon the vein and its branches. I was much surprised when I perceived that the veins of silver ore were perceptible upon the surface.

"The laws of Mexico bountifully provide for the miners, as it is the privilege of any one to search for ores, and to work the veins when found, as his exclusive prerogative. When an individual has made a discovery of rich ore, it is his duty to survey a given number of acres of land, for the use and benefit of the mine, and have the same recorded in the office of the *alcalde*. He must then commence to work it in ten days' time, with a particular number of hands, and, at stated periods, increase his expenditures to an amount limited by law. The discoverer, failing to comply with the requisitions, forfeits all claim and title to the property, and may be ousted by the will of any other occupant who can punctiliously perform the demands of government. The proprietor of the land upon which the discovery has been made, is always pleased at the location of mining-operations upon his territories, for it brings to his doors a ready market for all the surplus of his *hacienda campus*. Being contented with the profits of his grain and stock sold to the operators of the mine, he has hazarded nothing in the uncertain results of opening and proving it: and besides, wherever a shaft is sunk, there is also a town erected, which likewise affords a speculation in lots, to the original proprietor of the soil.

"The principal vein of silver ore at Zacatecas, which first shows itself in the plain, ascends the nearest mountain, and is discovered about midway, where a shaft has been sunk to a great depth, but is not now worked. The vein then descends over the side of the mountain, and, after crossing the next ravine, suddenly ascends to the top of the next cone-shaped peak, and so on, ascending and descending, until it dips under the city, and again rises to the top of a high peak, immediately to the north, overlooking Zacatecas.

"The appearances of the range of mountains, upon which are the veins of ore, are like all others in the interior of Mexico. They are almost deserted by vegetable growth of any kind; for the small amount of soil on these heights, generally, only produces a thorny, scrubby growth, that makes but a thin appearance in places. The silver mountains of Zacatecas, to my view, had something of a peculiar appearance, for they seemed to have been thrown up more abruptly, with a greater number of cones, having nipples crowning their summits. They seemed to have contained more of the native red rock of the country than any other mountain that I had beheld. I was informed that in mountains where silver was most prolific the rock chiefly abounded in porphyry, green, and red-stone.

"But to return—as I approached the mountain a large convent was exposed to my view, which was a present to the order of Gray Friars by the owner of one of the mines. It was surrounded by the village of Guadaloupé, which had a romantic aspect, situated just at the foot of the mountain, commanding the pass, where I was directed the road to Zacatecas. Every town, of any consequence in Mexico, has its *pueblo* of Guadaloupé, erected in honour of the patron saint of the country.

"A GRANARY.—Between the road and the village I perceived a high wall enclosing a large plot of ground, which I supposed to be a fortification; but my friend informed me it was a granary belonging to *Senor Don Garcias*. Such granaries were not common, but had been invented and built by him, to prevent insects from injuring his grain; his speculations in that article having been extensive; in one of which he is said to have made above a hundred thousand dollars by one purchase.

"The plan he adopted to preserve grain for any given time, was to build houses

within the enclosure, of a cone-like form, about twenty feet at the base. They are stuccoed, and when filled with grain, the port or door is also plastered over, light, air, and moisture are all excluded, and the grain never becomes damaged.

WORKING A SILVER MINE.—"I was conducted by the polite Mr. Kimble over his *hacienda beneficio mineral*, the largest one in the world, and where more silver was manufactured than at any other hacienda known. This mine is the only one worked to any profitable extent in the whole country that entirely belongs to a Mexican company. To give my readers an understanding of its magnitude, and the consequent expenditures of raising the ores, and reducing them to silver, Mr. K. assured me that it required an outlay of 50,000 dollars per week to conduct its operation. The mine is worked by steam-power, the fuel costing fourteen dollars per cord.

"The administrador conducted me first to the crushing apartment. In this extensive room were many tons of ore, deposited in the condition in which it was brought from the mine. The ore resembled fragments of stone, fresh hammered for a macadamised road, each piece large enough to pass through an inch ring. In this form it is thrown under the crushing-mill to be pulverised. This machine is similar to a powder mill, with the exception that the beams are heavier and closer together. Having gone through the process of crushing, the ore is removed to the grinding mills, and in this hacienda there are many.

"The grinding mills are circular, and from ten to fifteen feet in diameter. They can be propelled by any kind of power, but in Mexico that of mules is most generally used. The bottoms are of porphyritic rock of the greatest solidity that can be obtained. Over this solid disk are suspended three long heavy stones, also of porphyry. These are held to their places by chains, which connect them to three horizontal beams, extending from the shaft pivot that rests upon the centre of the disk. The stones have their front edges a little elevated, so as to receive the ore, when in motion, while the rear portion performs its duty by grinding it to an impalpable powder.

"When the ore is put into the grinder, water is from time to time added to it, until, in the process of pulverisation, it acquires a thick and paste-like appearance and consistency, which requires much time. The process of grinding completed, the ore is removed to the great square of the hacienda, which I should judge contains about two acres of land, where it is deposited in circular beds of about ten feet in diameter, upon the pavement of the square, in the same manner as a brick-yard. Salt, or salt earth is, in suitable quantities, sprinkled over the pile, as also a little proportion of pulverised pine bark, and if this cannot be secured, dried manure is used as a substitute. The whole is then trodden by horses for some hours, until all the parts have completely acquired an admixture. It is then left for three or four days, when a substance, prepared from copper ore, called *micastral*, is added. The whole mass is then sprinkled with quicksilver in considerable quantities. It is then worked with horses for five or six hours, after which it is left until the next day, when a little water is added, being worked repeatedly from day to day until the whole has effectually amalgamated. When this is consummated, a suitable portion is deposited in an elevated stone vat, so that the water may escape. A large amount of water is again added to the ore, when the whole is rapidly mixed, by a fly-wheel in the vat, propelled by mules, just like the pool of a paper-mill.

"In this process the amalgam of the mineral settles to the bottom, and when the whole mass has been thoroughly washed, the water is discharged, and the offal escapes. The deposited amalgam is cleansed by being filtered through a canvass, until it assumes a plastic state, when it is made into forms of triangular bricks, by means of moulds. These are set up into a circular mass, with interstices between each. A copper bell is then placed over the whole, in the presence of all the officers of the hacienda, which is then covered over with charcoal, and this is kept ignited for about twelve hours, by which time the mercury is all sublimated. Being allowed to cool, the silver is taken out in a pure state, ready to cast into bars.

"It requires six pounds of quicksilver to obtain one mark of silver, including the incorporation and the bath, which is the amalgamation, and in the separation there is a

loss of the same weight of silver, as of mercury, which is a fraction, besides an additional consumption of mercury, that has never been accounted for.

"During the whole of the above process of extracting the silver, that is to say from the commencement of the washing, until the fire is lighted around the bell containing the amalgam, the administrador has his officers summoned to attend, to prevent the secreting of the metal, but after the charcoal is ignited all is safe, for if those left to watch the fire should raise the bell, the inhaling of the sublimed mercury, a certain result of the imprudence, would destroy life.

"The appearance of the amalgam, when the copper bell is lifted from it, is porous, like a honey-comb, which is caused by the quicksilver leaving the silver in sublimation. Thus, it is perceived, that to make pure silver is no easy task, but requires days of labour from man, beast, and machinery, as well as the watchfulness necessary to be bestowed on it.

"After the silver is cast into solid lumps, about the size and shape of pigs of lead, as seen in the United States, it is carried to the mint, when, agreeable to its weight, being previously assayed, its value in coin is received.

"From the office of the administrador it is next carried into the furnace room, where the pigs are melted, for the purpose of casting them into bars, eighteen inches in length, one and a half broad, and a quarter of an inch in thickness. They are then weighed to discover if they correspond with the original weight of the pigs. The bars are then put under the rolling mill, where they are reduced to a flatness consistent with the dimensions of the coin to be manufactured. The thin slips of silver are then taken to machinery, where they are cut to the different sizes of money, and from thence to the edging mill, which prepares it to receive the impression of the Mexican eagle, prickly pear, bee-hive, sun, &c. From thence it has to pass through the pickling, or washing apartment, where the coin is cleansed, and receives its perfect brightness, and is rendered fit for use.

"The silver, from the time of its being first melted into pigs, until it is washed, never passes from the hands of one workman into those of another, without the scrutiny of weight and counting. And thus it is, the invaluable metal, when scattered to the world, in its fluctuating passage, ever creates the greatest solicitude to its possessor, until it returns to nature by invisible atoms.

"The mines of Zacatecas and Frisnillo are said to be about the oldest known in Mexico, and from their richness, and the length of time they have been worked, have produced an amount of bullion that would almost seem incredible. A gentleman, of high standing as a miner, informed me that it had been estimated that Zacatecas and Frisnillo had yielded two hundred millions of the precious metals. There are two kinds of silver mines, designated by the letters A and U, owing to the two different ways that veins of silver make their appearance generally.

CHANGE OF CLIMATE.—"After we had mounted, and were leaving San Alto, I perceived that my previous day's journey had brought me to a warm country, for many of the houses of that place were fenced in by the tall *organo*. This is a species of the prickly pear, and is not only beautiful to look at, but a curiosity in the vegetable kingdom. It is of a perfect deep green colour, and rises from the ground in a solid column, of an equal size, often reaching a height of twenty feet. It is regularly fluted from the bottom to the top, as if done by the exactness of an artist's line.

"The *maguey* also flourished here. It is this plant which, I believe, is said to blossom once in a hundred years. It is true, that the colder the latitude, the later it will flower; but, in the climate of Mexico, it generally blossoms once in seven years.

"My journey, on this day (after leaving the mining town of Sombrereto), was uninterrupted, save by fatigue, hunger, and intolerable thirst; for we found neither pool nor stream of water. The country through which we travelled was uneven and rolling; but, during the latter part of the day, the plain became a dead level, and, from first, having to travel through the low musquite-growth, we came to a cove of broad shady trees, small, and thinly scattered over the land, which might be denominated a forest.

"Just before the set of sun we hove in view of the castle of the Hacienda campus de los Muleros (a place of mules), yet every other kind of stock and vegetation was raised

and cultivated there, for it was one of the finest estates that I had ever beheld. The sight of the premises was most congenial, for it was the first house that I had seen the whole day; although it was full five miles from me, it promised repose from my toils, at no very distant period, and I felt cheered with the hope. Presently we came upon a gang of small red wolves, common in Mexico, and then we approached a herd of many thousand sheep: at length we passed the ranchos of the place, and arrived immediately in front of the great house.

"One of my servants, who had been sent before me to the castle, informed me that the administrador had said, that there was no spare room for strangers; for the house was filled with corn, saving one apartment for himself and wife; and that I would have to seek lodgings in one of the ranchos. The servant also stated, that there was much excitement with the people, resulting from the fact of two murders, that had been committed that day, near Muleros. I felt perplexed and disappointed in not being decently housed, for I had never yet lodged in a filthy rancho.

"However, there was one other good building in the place, from which a well-dressed young Mexican came out, and invited me to accept a room in his dwelling. I thanked him for the offer, which I accepted. Mine host was a gay and conversant gentleman, who had but a few weeks been wedded to a bouncing black-eyed Mexican girl. He informed my interpreter that the proprietor of Muleros was a very inhospitable man, and that he believed that he had a part in all the many robberies and murders which happened in that quarter.

"During that day several things occurred of a diverting nature. First, in passing by an extensive corn-field, I perceived up a distant tree, in the midst of the corn, a nest, and, as I really imagined, a bird in it, and observed to my interpreter that there was the largest zopilote that I ever beheld. He laughed heartily, and informed me that it was nothing more nor less than a Mexican wrapped in his serapi, guarding his crop. Crops in Mexico are watched both day and night, to prevent the stock, and two-legged thieves, from molesting it."

Speaking of some Ladrones whom he passed, he observes—

"It is the rule in Mexico, for the weaker party always to give the way. Our companies were equal; but, as I had extra animals, I certainly was entitled to the road. And if armed men, who are not travellers, do not give the road, it is conclusive evidence, as I had been advised, of their hostile intent. We arrived in safety at San Causin, a hacienda campus. The water was good; the tortillas, the frijoles, the chili, and the stewed mutton, were all, to hungry man, delightful; and sleep, on that night, was never more refreshing.

"On the following morning, all of my men being in readiness to recommence the journey, which was that day to put me in the city of Durango, I gave orders that all of our guns and pistols should be discharged and reloaded, which had not been done since we left Zacatecas, as I felt desirous of witnessing the performances of our weapons. The volley we fired was equal to a commandant's salute, as we numbered about forty rounds, eighteen of which were from my own person and saddle.

"At every place we stopped, accounts of murders and robberies were detailed. We had not travelled more than five leagues before we came upon the corpses of two men, who had been murdered the day previous; one of them appeared to have come to his end by a bullet—the other had several shocking sabre wounds.

"On this day I had to cross the same river twice. The last time I was ferried over in a dug-out, which cost me one dollar and a half, though my animals had to swim across with the Mexican who drove them. I had then travelled about 1400 miles in Mexico, and of the few rivers that I had seen, none of them was above a moderate stone's-throw across.

"The country over which I had passed was thinly covered with musquite growth, and some cotton-wood; but, upon being landed over the ferry, I was upon the plain of Durango, a beautiful level country. Although the table-land was totally divested of timber, yet the mountains of Durango towered with the pine, the cypress, and other spe-

cies of trees ; and, near to the city, Mr. Lakeman, an American, is the proprietor of an iron furnace."

DURANGO. —On the 9th instant, at nine o'clock at night, he entered the city of Durango, and put up at the De la Santa Paula meson. The meson joined a large religious edifice, in which the Inquisition was formerly located. It is called De Cadena Casa, the chain-house. From that building, for some few days in the year, a chain was extended across the street, during which time, if any individual committed any offence or crime against the law, and he could lay hands upon that chain, before arrested by the legal authorities, he escaped all future molestation or prosecution. Thus crime was encouraged through the instrumentality of religion.

"In the De Commercio Plaza, all kinds of fruits, provisions, and merchandise were offered for sale—promiscuously spread upon the pavement ; and in such places my interpreter informed me the ladrone vended such earnings as he desired to part with.

"The Alemada of the city of Durango was as lovely and delightful a retreat as I had ever in my life enjoyed. A grove of trees shaded its clean walks and seats, whilst a fountain of water refreshed and cooled the atmosphere. It is located between the Plaza de los Torros, and the town, and commanded a view of the plain, the city, and the extended mountains around, and a more picturesque scene I never beheld. The convento of the patron saint of the town was situated upon a romantic mound of earth and stone. The view from this edifice excels the imagination of poet and artist, and exceeds any other scene of the kind ever before exhibited to my view. The city of Durango appeared to cover about the same amount of space as the city of Mexico. The buildings are not so high, but are, otherwise, not less in dimensions. Durango is a bishopric, and the two high steeples of the cathedral towered far above those of the many other churches and convents of the place.

"In this town has long been established one of the nine mints belonging to the government. It was not a little amusing to see my Zacatecas servants comparing the coins of their own city with those of Durango ; while one of them said, satirically, that the bird on the Durango coin looked more like a zopilote (buzzard) than the Mexican eagle. Another responded that he would be rejoiced if either of the fowls would build a nest in his pocket, and hatch young ones there. The inhabitants of Durango were fewer than I had supposed, judging from the extent of the city. I was informed that the population did not exceed 30,000.—(See Mr. Gregg's account hereafter.)

"The great silence that prevails in Mexican towns is remarkable, when the church bells are not ringing, and from the garrison the clang of the trumpet-horn is no longer blown. From twelve to three o'clock in the afternoon, all is still, and from a distance no sound is heard ; and, in fact, in the hot valleys, and on the coasts, the doors of the houses are all locked, and the inhabitants so wrapped in sleep, that a traveller might ride through the streets of a town without seeing a human being.

"The city of Durango had, in the month previous to my arrival, suffered a heavy calamity, which resulted in the serious damage, more or less, and the ruin of 400 houses. The cause of this destruction of property had its origin from the heavy rains that had fallen, which had so saturated the sun-burnt bricks, that the crumbling walls were not able to support the roofs, and of course they tumbled in. It was not in the knowledge of any one that, in the month of January, it should rain, and none of the inhabitants had ever experienced, in the wet season, so great and continued a fall of water as came so unexpectedly upon them. The sudden rise of the streams and small rivers was so rapid as to do much damage to the haciendas, to drown stock, and wash down houses.

"On the 12th instant, I had the honour of being presented to Cesmo Sir Gobernador y Commandant General D. Jose Antonio Heridia. I did myself, on this occasion, the distinction of showing the general *an American uniform*. After some conversation, I retired, leaving him uninterrupted in his multifarious public duties. From the government-house I went to that of Mr. John Belden, an American, of the city of New York, who had invited me to dine with him that day. Mr. Belden had been successful in business, and had accumulated a large fortune ; and whether or not to please himself

or the Mexicans, I cannot say, he often wore costly diamond jewels, and hence he was called the Prince of Diamonds.

"The people of the city of Durango, both foreign and native, seemed to be of a better order than any others I had seen in all Mexico. This possibly might result from the circumstance of having such men as Ramires residing amongst them. The Bishop of Durango, also, was the only pious man that I heard of during all my travels in that country.

"This celebrated and beloved bishop is said to be truly religious. I was informed by a distinguished citizen that, sacred to his vow, he never had a female to enter his house, and that all of his servants were men; a fact unknown in relation to any other clergyman in the country. His father-confessor accompanied him on every occasion, and regularly, three times a day, he made confession.

"Much to my regret, I had to exchange my American dress for the Mexican *jaceti*, a roundabout jacket. Long-tailed or frock-coats are never worn, excepting at the capital, or by foreigners; and, as a gentleman informed me, if a man should be seen riding in any other apparel than that of a *jaceti* and leather pants, he would be looked upon as a monster, and accordingly almost stoned to death. It is very important to conform to Mexican costume, both to gratify Mexican vanity, as also to disguise yourself as a native, for the traveller cannot know when he may hear the exclamation, 'Death to all foreigners!' The handy and comfortable little jacket I did not at all regard, but it was the heavy weight of iron and steel with which I was obliged to encumber myself and saddle; for to my belt was a powder-flask, a bag of bullets, two six and one single-barrelled pistols, a bowie-knife, and a sword; while looped to the horn of my saddle was a double-barrelled gun, holsters with two pistols, and my nine-inch barrel rifle pistol, hanging to my right, on the skirt of my saddle.

"As in the journey before me I should be often obliged to *bivouac* in the open air, I had provided myself with a tent, as also an additional supply of London pickled-salmon, and ham, crackers, and jerked beef. At Durango, I was advised to employ a guide, as no one could find the way to Canales, excepting those who had travelled the mountains. I did not discharge my interpreter here, for the reason that I found no serious complaint to lodge against him, and for fear that in an exchange I might not obtain a better one.

"The Governor of Durango furnished me with letters to the Alcalde of Canales, and the Prefect of Tamazula; Mr. Stalknit had at that time despatched ten loads of silver for Mazatlan.

"While at Durango, the two brothers, Stalknits, invited me to a ride of two miles in the country, to visit their cotton factory. The buildings of their establishment were as commodious as any others I had seen of the kind in the Union, working 20,000 spindles, and their complement of looms. The yarns of the factory were all wove into fabrics, with the exception of thread for sewing purposes. The conductors of the manufacturing department were all New Englanders."

Mr. Gregg, in his interesting work on the American and Santa Fé trade, gives descriptive sketches of the trade south of that town, and of the mining districts and towns of Durango and Zacatecas, from which the following extracts are taken:

"The officers of the custom-house were already compromised by certain cogent arguments (bribes) to receive the proprietors of this caravan with striking marks of favour, and the *Senor Administrador de Rentas*, Zuloaga himself was expecting an *ancheta* of goods. Therefore, had they treated us with their wonted severity, the contrast would have been altogether too glaring.

"We arrived at Chihuahua on the first of October, after a trip of forty days, with waggons much more heavily laden than when we started from the United States. The whole distance from *Santa Fé* to *Chihuahua* is about 550 miles,—being reckoned 320 to Paso del Norte, and 230 from thence to Chihuahua. The road (natural) from El Paso south is mostly firm and beautiful, with the exception of the sand-hills before spoken of; and it is only rendered disagreeable by the scarcity and occasional ill-savour of the water. The route winds over an elevated plain among numerous detached ridges of low mountain—spurs, as it were, of the main Cordilleras, which lie at a consi-

derable distance to the westward. Most of these extensive intermediate plains, though in many places of fertile-looking soil, must remain wholly unavailable for agricultural purposes, on account of their natural aridity, and a total lack of water for irrigation.

"The trade to the south constitutes a very important branch of the commerce of the country, in which foreigners, as well as natives, are constantly embarking. It is customary for most of those who maintain mercantile establishments in Chihuahua, to procure assortments of Mexican fabrics from the manufactories of Leon, Aguascalientes, and other places of the same character in the more southern districts of the republic.

FAIRS.—"At certain seasons of the year, there are held regular *ferias*, at which the people assemble in great numbers, as well of sellers as of purchasers. There are some eight or ten of these annual fairs held in the republic, each of which usually lasts a week or more."

The only description of these fairs that we have is by Mr. Gregg, who says :

"I set out from Chihuahua with a party consisting of four men (including myself) and two empty waggons—not a very formidable escort to protect our persons as well as specie and bullion (the only transmissible currency of the country) against the bands of robbers which at all times infest that portion of our route that lay south of Durango. From Chihuahua to that city the road was rendered still more perilous by the constant hostilities of the Indians. On the 7th of March we arrived without accident at the town of Corro Gordo, the northernmost settlement in the department of Durango, and the following day we reached La Zarca, which is the principal village of one of the most extensive haciendas in the north. So immense is the amount of cattle on this estate, that, as it was rumoured, the proprietor once offered to sell the whole hacienda, stock, &c., for the consideration alone of fifty cents for each head of cattle found on the estate ; but that no person has ever yet been able or willing to muster sufficient capital to take up the offer. This estate covers a territory of perhaps a hundred miles in length, which comprises several flourishing villages.

"In two days more we reached Rio Nazas, a beautiful little river that empties itself into Lake Cayman.* Rio Nazas has been celebrated for the growth of cotton, which, owing to the mildness of the climate is sometimes planted fresh only every three or four years. The light frosts of winter seldom destroy more than the upper portion of the stalk, so that the root is almost perennial. About twenty-five miles further we stopped at the mining village of La Noria, where we were obliged to purchase water for our mules. It is not unusual, also, for the proprietors of haciendas to demand remuneration for the pasturage on the open plains consumed by the animals of travellers—a species of exaction which one never hears of in the north of Mexico.

"Our next stopping-place was Cuencamé, which may well be called the Village of Churches, for, although possessing a very small population, there are five or six edifices of this description. As I had business to transact at Durango, which is situated forty or fifty miles westward of the main southern road, I now pursued a direct route for that city, where I arrived on the 16th of March.

DURANGO "is one of the handsomest cities in the north, with a population of about 20,000. It is situated in a level plain, surrounded in every direction by low mountains. It presents two or three handsome squares, with many fine edifices and really splendid churches. The town is supplied with water for irrigating the gardens, and for many other ordinary purposes, by several open aqueducts, which lead through the streets, from a large spring, a mile or two distant ; but as these are kept filthy by the offal that is thrown into them, the inhabitants who are able to buy it, procure most of their water for drinking and culinary purposes from the *aguadores*, who pack it, on asses, usually in large jars, from the spring.

"This is the first northern city in which there is to be found any evidence of that

* The numerous little lakes throughout the interior of Mexico, without outlet, yet into which rivers are continually flowing, present a phenomenon which seems quite singular to the inhabitants of our humid climates. But the wastage in the sand, and still greater by evaporation in those elevated dry regions, is such that there are no important rises in the lakes except during unusual freshets.—Gregg.

variety of tropical fruits for which Southern Mexico is so justly famed. Although it was rather out of season, yet the market actually teemed with all that is most rich and exquisite in this kind of produce. The *maguery*, from which is extracted the popular beverage called *pulque*,* is not only cultivated extensively in the fields, but grows wild every where upon the plains. This being the height of the pulque season, a hundred shanties might be seen loaded with jugs and goblets filled with this favourite liquor.

SCORPIONS.—“Durango is also celebrated as being the head-quarters, as it were, of the whole scorpion family. During the spring, especially, so much are the houses infested by these poisonous insects, that many people are obliged to have resort to a kind of mosquito-bar, in order to keep them out of their beds at night. As an expedient to deliver the city from this terrible pest a society has actually been formed, which pays a reward of a *cuartilla* (three cents) for every *alacran* (or scorpion) that is brought to them. Stimulated by the desire of gain, the idle boys of the city are always on the look out; so that, in the course of a year immense numbers of this public enemy are captured and slaughtered. The body of this insect is of the bulk of a medium spider, with a jointed tail one to two inches long, at the end of which is a sting whose wounds are so poisonous as often to prove fatal to children, and are very painful to adults.

“Although we were exceedingly well armed, yet so many fearful stories of robberies said to be committed almost daily on the southern roads reached our ears that, before leaving Durango I resolved to add to my ‘weapons of defence’ one of those peculiarly terrible dogs which are sometimes to be found in this country, and which are very serviceable to travellers situated as I was.

“On the 22nd of March we left Durango, and, after a few days’ march found ourselves once more in the *camino real* that led from Chihuahua to Zacatecas. As all travellers go armed, it is impossible to distinguish them from banditti;† so that the unsuspecting trader is very frequently set upon by the very man he had been consorting with in apparent good fellowship, and either murdered on the spot, or dragged from his horse with the lasso, and plundered of all that is valuable about him.

AGUASCALIENTES, in 22 deg. N. latitude and 102 deg. 15 min. W. longitude, “is beautifully situated in a level plain, and would appear to contain about twenty thousand inhabitants, who are principally engaged in the manufacture of *rebozos* and other textures mostly of cotton. As soon as I found myself sufficiently at leisure I visited the famous warm spring (*ojo caliente*) in the suburbs from which the city derives its euphonious name.

“It had been originally my intention to continue on to Leon, another manufacturing town some seventy or eighty miles from Aguascalientes; but, hearing that Santa Anna had just arrived there with a large army, on his way to Zacatecas to quell an insurrection, I felt very little curiosity to extend my rambles further. Having, therefore, made all my purchases in the shortest possible time, in a few days I was again in readiness to start for the north.

“That my mules might be in condition for the hard travel before me, it was necessary to have them shod: a precaution, however, which is seldom used in the north of Mexico, either with mules or horses. Owing a little to the peculiar breed, but more still, no doubt, to the dryness of the climate, Mexican animals have unusually hard hoofs. Many will

* Also, from the *Pulque* is distilled a spirituous liquor called *mexcal*. The *maguery* (*Agave Americana*) is besides much used for hedging. It here performs the double purpose of a cheap and substantial fence, and of being equally valuable for *pulque*. When no longer serviceable in these capacities, the pulpy stalk is converted, by roasting, into a pleasant item of food, while the fibrous blades, being suitably dressed, are still more useful. They are manufactured into ropes, bags, &c., which resemble those made of the common sea-grass, though the fibres are finer. There is one species (which does not produce pulque, however), whose fibres, known in that country as *pita*, are nearly as fine as dressed hemp, and are generally used for sewing shoes, sadlery, and similar purposes.—Gregg.

† Travellers on these public highways not only go “armed to the teeth,” but always carry their weapons exposed. Even my waggoners carried their guns and pistolswung upon the pommels of their saddles. At night, as we generally camped out, they were laid under our heads or close by our sides.—Gregg.

travel for weeks, and even months, over the firm* and often rocky roads of the interior, the pack-mules carrying their huge loads without any protection whatever to the feet, save that which nature has provided.

MINING DISTRICT OF JESUS MARIA IN NORTHERN MEXICO.—This mining district was visited by Mr. Gregg, who says, "I set out from Chihuahua on the 15th of October. My party consisted of but one American comrade with a Mexican mule-teen, and three or four mules freighted with specie to be employed in the silver trade; a rather scanty convoy for a route subject to the inroads of both savages and robbers. For transportation, we generally pack our specie in sacks made of raw beef-hide, which shrinks upon drying, and thus presses the contents so closely as to prevent friction. A pair of these packages, usually containing between one and two thousand dollars each, constitutes an ordinary mule load on the mountain routes.

"The road in this direction leads through the roughest mountain passes; and, in some places, it winds so close along the borders of precipices, that by a single misstep an animal might be precipitated several hundred feet. Mules, however, are very sure-footed; and will often clamber amongst the most craggy cliffs with nearly as much security as the goat. I was shown the projecting edge of a rock over which the road had formerly passed. This shelf was perhaps thirty feet in length by only two or three in width. The road which leads into the town of Jesus-Maria from the west side of the mountain is also extremely perilous and steep, and seems almost to overhang the houses below. Heavily laden mules have sometimes slipped off the track, and tumbled headlong into the town. This place is even more pent up between ridges than Zacatecas: the valley is narrower and the mountains much higher; while, as is the case with that remarkable city, the houses are sometimes built in successive tiers, one above another; the *azoteas* of the lower ones forming the yard of those above.

"The first mine I visited consisted of an immense horizontal shaft cut several hundred feet into a hill-side, a short distance below the town of Jesus-Maria, in the Sierra Madre, (latitude 28 deg. N., longitude 107 deg. 10 min. W.,) upon which the proprietors had already sunk, in the brief space of one year, the enormous sum of one hundred and twenty thousand dollars! Such is often the fate of the speculative miner, whose vocation is closely allied to gaming, and equally precarious.

"The most important mine of Jesus-Maria at this time was one called Santa Juliana, which had been the means of alternately making and sinking several splendid fortunes. This mine had then reached a depth of between eight and nine hundred feet, and the operations were still tending downwards. The materials were drawn up by mule-power applied to a windlass: but as the rope attached to it only extended half-way down, another windlass had been erected at the distance of about four hundred feet from the mouth of the cavern, which was also worked by mules, and drew the ores, &c., from the bottom. On one occasion, as I was standing near the aperture of this great pit, watching the ascent of the windlass rope, expecting every moment the appearance of the large leathern bucket which they employ for drawing up the minerals as well as the rubbish and water,† from the bottom, what should greet my vision but a mule, puffing and writhing, firmly bound to a huge board constructed for the purpose, and looking about as demure upon the whole as a sheep under the shears.

"The ore which is obtained from these mines, if sufficiently rich to justify the operation, is transferred to the smelting-furnaces, where the pure metal is melted down and extracted from the virgin fossil. If, on the contrary, the ore is deemed of inferior quality, it is then submitted to the process of amalgamation. The *moliendas*, or crushing-mills (*arrastres*, as called at some mines), employed for the purpose of grinding the ores, are somewhat singular machines. A circular (or rather annular) cistern of some twenty or thirty feet in diameter is dug in the earth, and the sides as well as the bottom are lined

* Some of these table-plain highways, though of but a dry sandy and clayey soil, are as firm as a brick pavement. In some places, for miles, I have remarked that the nail-heads of my shod animals would hardly leave any visible impression.

† Water has sometimes accumulated so rapidly in this mine as to stop operations for weeks together.

with hewn stone of the hardest quality. Transversely through an upright post which turns upon its axis in the centre of the plan, passes a shaft of wood, at each end of which are attached by cords one or two grinding-stones with smooth flat surfaces, which are dragged (by mules fastened to the extremities of the shaft) slowly around upon the bottom of the cistern, into which the ore is thrown after being pounded into small pieces. It is here ground, with the addition of water, into an impalpable mortar, by the constant friction of the dragging stones against the sides and bottom of the cistern. A suitable quantity of quicksilver is perfectly mixed with the mortar; to which are added some muriates, sulphates, and other chemical substances, to facilitate the amalgamation. The compound is then piled up in small heaps, and not disturbed again until this process is supposed to be complete, when it is transferred to the washing-machine. Those I have observed are very simple, consisting of a kind of stone tub, into which a stream of water is made to flow constantly, so as to carry off all the lighter matter, which is kept stirred up by an upright studded with pegs, that revolves in the centre, while the amalgamated metals sink to the bottom. Most of the quicksilver is then pressed out, and the silver submitted to a burning process, by which the remaining portion of mercury is expelled.

"The silver which is taken from the furnace generally contains an intermixture of gold, averaging from ten to thirty per cent; but what is extracted by amalgamation is mostly separated in the washing. While in a liquid state, the gold, from its greater specific gravity, mostly settles to the bottom; yet it usually retains a considerable alloy of silver. The compound is distinguished by the name of *oroche*. The main portion of the silver generally retains too little gold to make it worth separating.

"Every species of silver is moulded into *barras*, or ingots, weighing from fifty to eighty pounds each, and usually worth between one and two thousand dollars. These are assayed by an authorised agent of the government and stamped with their weight and character, which enables the holder to calculate their value by a very simple rule. When the bullion is thus stamped, it constitutes a species of currency, which is much safer for remittances than coin. In case of robbery, the *barras* are easily identified, provided the robbers have not had time to mould them into some other form. For this reason, people of wealth frequently lay up their funds in ingots; and the cellars of some of the *ricos* of the South are often found teeming with large quantities of them, presenting the appearance of a winter's supply of fuel.

"As the charge for parting the gold and silver at the Mexican mints is generally from one to two dollars, and coinage about fifty cents per pound, this assayed bullion yields a profit upon its current value of nearly ten per cent at the United States Mint; but, if unassayed, it generally produces an advance of about double that amount upon the usual cost at the mines. The exportation of bullion, however, is prohibited, except by special licence from the general government. Still, a large quantity is exported in this way, and considerable amounts smuggled out through some of the ports.

"A constant and often profitable business in the 'silver trade' is carried on at these mines. As the miners rarely fail being in need of ready money, they are generally obliged to sell their bullion for coin, and that often at a great sacrifice, so as to procure available means to prosecute their mining operations. To profit by this trade, as is already mentioned, was a principal object of my present visit. Having concluded my business transactions, and partially gratified my curiosity, I returned to Chihuahua.

"It is usual for each trader, upon his arrival in Chihuahua to engage a store-room, and to open and exhibit his goods, as well for the purpose of disposing of them at wholesale as retail. His most profitable custom is that of the petty country merchants from the surrounding villages. Some traders, it is true, continue in the retail business for a season or more, yet the greater portion are transient dealers, selling off at wholesale as soon as a fair bargain is offered.

MODE OF SELLING GOODS.—"The usual mode of selling in Chihuahua is by the lot. Cottons, as calicoes and other prints, bleached, brown, and blue domestics, both plain and twilled, stripes, checks, &c., are rated at two or three *reales** per *vara*, without the least

* 12 *granos* make 1 *real*; 8 *reales*, 1 *peso*, or dollar. These are the divisions used in computation, but instead of *granos*, the copper coins of Chihuahua and many other places, are the *claco* or

reference to quality or cost, and the 'general assortment' at 60 to 100 per cent upon the bills of cost, according to the demand. The *varage* is usually estimated by adding eight per cent to the yardage, but the *vara* being thirty-three inches (nearly), the actual difference is more than nine. In these sales, cloths—indeed all measurable goods, except ribands and the like, sometimes enter at the *varage* rate. Every thing was sometimes rated by the *vara*—not only all textures, but even hats, cutlery, trinkets, and so on! In such cases, very singular disputes would frequently arise as to the mode of measuring some particular articles: for instance, whether pieces of riband should be measured in bulk, or unrolled, and yard by yard; looking-glasses, cross or lengthwise; pocket-knives, shut or open; writing-paper, in the ream, in the quire, or by the single sheet; and then, whether the longer or shorter way of the paper; and many others.

"Before the end of October, 1839, I had an opportunity of selling out my stock of goods to a couple of English merchants, which relieved me from the delays, to say nothing of the inconveniences attending a retail trade: such, for instance, as the accumulation of copper coin, which forms almost the exclusive currency in petty dealings. Some thousands of dollars' worth are frequently accumulated upon the hands of the merchant in this way, and as the copper of one department is worthless in another, except for its intrinsic value, which is seldom more than ten per cent of the nominal value, the holders are subjected to a great deal of trouble and annoyance.

"CITY OF CHIHUAHUA.—This city, when compared with Santa Fé and all the towns of the North, Chihuahua might indeed be pronounced a magnificent place; but, compared with the nobler cities of *tierra afuera*, it sinks into insignificance. According to Captain Pike, the city of Chihuahua was founded in 1691. The ground-plan is much more regular than that of Santa Fé, while a much greater degree of elegance and classic taste has been exhibited in the style of the architecture of many buildings; for though the bodies be of *adobe*, all the best houses are cornered with hewn stone, and the doors and windows are framed in the same. The streets, however, remain nearly in the same state as nature formed them, with the exception of a few roughly-paved side-walks. Although situated about a hundred miles east of the main chain of the Mexican Cordilleras, Chihuahua is surrounded on every side by detached ridges of mountains, but none of them of any great magnitude. The elevation of the city above the ocean is between four and five thousand feet; its latitude is 28 deg. 36 min.; and its entire population numbers about ten thousand souls.

"The most splendid edifice in Chihuahua is the principal church, which is said to equal in architectural grandeur any thing of the sort in the republic.

"Having closed all my affairs in Chihuahua and completed my preparations for departing, I took my leave of that city for the North on the 31st of October, 1839. I was accompanied by a caravan consisting of twenty-two waggons (all of which save one belonged to me), and forty odd men, armed to the teeth, and prepared for any emergency we might be destined to encounter: a precaution altogether necessary, in view of the hordes of hostile savages which at all times infested the route before us."—*Gregg's Commerce of the Prairies.*

jola ($\frac{1}{8}$ real) and the *currtilla* ($\frac{1}{4}$ real). The silver coins are the *medio* ($6\frac{1}{2}$ cents), the *real* ($12\frac{1}{2}$ cents), the *peseta* (2 reales), the *toston*, or half dollar, and the *peso* or dollar. The gold coins are the *doblon* or *onza* (doubloon), with the same subdivisions as the silver dollar, which are also precisely of the weight. The par value of the doubloon is sixteen dollars; but as there is no kind of paper currency, gold, as the most convenient remittance, usually commands a high premium—sometimes so high, indeed, that the doubloon is valued in the North at from eighteen to twenty dollars.

CHAPTER IX.

NEW MEXICO.

THIS country, the most recent account of which is that by Mr. Gregg, is bounded north and east by the territories of the United States, south by that of Texas and Chihuahua, and west by Upper California, it is surrounded by chains of mountains and extensive prairies, extending to a distance of 500 miles or more, except in the direction of Chihuahua, from which its settlements are separated by an uninhabited desert for nearly two hundred miles—and without the means of water communication with any other part of the world. It is entered from Northern Mexico or Chihuahua, by El Paso del Norte.

The whole territory, including extensive bleak regions with which it is intersected, comprises about 200,000 square miles. Mr. Gregg is of opinion that, "To which soever sovereignty that section of land may eventually belong, that portion of it at least, which is inhabited, should remain united. Any attempt on the part of Texas to make the Rio del Norte the line of demarcation would greatly retard her ultimate acquisition of the territory, as it would leave at least one-third of the population accustomed to the same rule, and bound by ties of consanguinity and affinity of customs wholly at the mercy of the contiguous hordes of savages, that inhabit the Cordilleras on the west of them. This great chain of mountains which reaches the borders of the Rio del Norte, not far above El Paso would, in my opinion, form the most natural boundary between the two countries, from thence northward."

RIVERS.—"There is not," it is stated by Mr. Gregg, "a single navigable stream to be found in New Mexico. The famous Rio del Norte is so shallow, for the most part of the year, that Indian canoes can scarcely float in it. Its navigation is also obstructed by frequent shoals and rippling sections for a distance of more than a thousand miles below Santa Fé. Opposite Taos, especially, for an uninterrupted distance of nearly fifteen miles, it runs pent up in a deep *canon* (ravine), through which it rushes in rapid torrents. This frightful chasm is absolutely impassable; and, viewed from the top, the scene is imposing in the extreme. None but the boldest hearts and firmest nerves can venture to its brink, and look down its almost perpendicular precipice, over projecting crags and deep crevices, upon the foaming current of the river, which, in some places, appears like a small rippling brook; while in others it winds its serpentine course silently but majestically along, through a narrow little valley; with immense plains bordering and expanding in every direction, yet so smooth and level that the course of the river is not perceived till within a few yards of the verge. I have beheld this *canon* from the summit of a mountain, over which the road passes some twenty miles below Taos, from whence it looks like the mere fissure of an insignificant ravine."

Baron Humboldt describes an extraordinary event as having occurred in 1752, of which he says the inhabitants of Paso del Norte still preserved the recollection in his day. "The whole bed of the river," he says, "became dry all of a sudden, for more than thirty leagues above and twenty leagues below the Paso: and the water of the river precipitated itself into a newly-formed chasm, and only made its reappearance near the *Presidio* of San Eleazeario.....At length, after the lapse of several weeks, the water resumed its course, no doubt because the chasm and the subterraneous conductors had filled up." This savors of the marvellous, as not the least knowledge of these facts

appears to have been handed down to the present generation. During very great droughts, however, this river is said to have entirely disappeared in the sand, in some places, between San *Elceario* and the Presidio del Norte.

"Notwithstanding the numerous tributary streams which would be supposed to pour their contents into the Rio del Norte, very few reach their destination before they are completely exhausted. Rio Puerco, so called from the extreme muddiness of its waters, would seem to form an exception to this rule. Yet this also, although at least a hundred miles in length, is dry at the mouth for a portion of the year. The creek of Santa Fé itself, though a bold and dashing rivulet in the immediate vicinity of the mountains, sinks into insignificance, and is frequently lost altogether before it reaches the main river. Pechos and Conchos, its most important inlets, would scarcely be entitled to a passing remark, but for the geographical error of Baron Humboldt, who set down the former as the head branch of the 'Red River of Natchitoches.' These streams may be considered the first constant-flowing inlets which the Rio del Norte receives from Santa Fé south—say for the distance of five hundred miles! It is then no wonder that this 'Great River of the North' decreases in volume of water as it descends. In fact, above the region of tide-water, it is almost everywhere fordable during most of the year, being seldom over knee-deep, except at the time of freshets. Its banks are generally very low, often less than ten feet above low-water mark: and yet, owing to the disproportioned width of the channel (which is generally three or four hundred yards), it is not subject to inundations. Its only important rises are those of the annual freshets, occasioned by the melting of the snow in the mountains.

"This river, though its entire length, following its meanders from its source in the Rocky Mountains to the Gulf of Mexico, must be considerably over two thousand miles, is hardly navigable to the extent of two hundred miles above its mouth."

SANTA FÉ, the capital of New Mexico, is the only town of any importance in the province. It is sometimes written *Santa Fé de San Francisco* (Holy Faith of St. Francis), the patron saint. It occupies the site of an ancient Pueblo or Indian village. Its situation in latitude 35 deg. 41 min. N., and longitude 106 deg. W., is twelve or fifteen miles east of the Rio del Norte, "at the western base of a snow-clad mountain, upon a beautiful stream of small mill-power size, which ripples down in icy cascades, and joins the river some twenty miles to the south-westward. The population of the city itself but little exceeds 3000; yet, including several surrounding villages which are embraced in its corporate jurisdiction, it amounts to nearly 6000 souls.* The town is very irregularly laid out, and most of the streets are little better than common highways traversing scattered settlements which are interspersed with corn-fields nearly sufficient to supply the inhabitants with grain. The only attempt at any thing like architectural compactness and precision consists in four tiers of buildings, whose fronts are shaded with a fringe of *portales* or *corredores* of the rudest possible description. They stand around the public square, and comprise the *Palacio*, or governor's house, the custom-house, the barracks (with which is connected the fearful *Calabozo*), the *Casa Consistorial* of the *Alcaldes*, the *Capilla de los Soldados*, or military chapel, besides several private residences, as well as most of the shops of the American traders.

POPULATION.—"The population of New Mexico is almost exclusively confined to towns and villages, the suburbs of which are generally farms. Even most of the *ranchos* and *haciendas* have grown into villages,—a result almost indispensable for protection against the marauding savages of the surrounding wilderness. The principal of these settlements are located in the valley of the Rio del Norte, extending from nearly one hundred miles north to about one hundred and forty south of Santa Fé.† The most

* Its elevation above the ocean is nearly 7000 feet; that of the valley of Taos is no doubt over a mile and a half. The highest peak of the mountain (which is covered with perennial snow) some ten miles to the north-east of the capital, is reckoned about 5000 feet above the town. Those from Taos northward rise still to a much greater elevation.

† The settlements *up the river* from the capital are collectively known as *Rio-Arriba*, and those *down the river* as *Rio-Abajo*. The latter comprise over a third of the population, and the principal wealth of New Mexico.

important of these, next to the capital, is *El Valle de Taos*,* so called in honour of the *Taos* tribe of Indians, a remnant of whom still forms a *pueblo* in the north of the valley. No part of New Mexico equals this valley in amenity of soil, richness of produce and beauty of appearance. Whatever is thrown into its prolific bosom, which the early frosts of autumn will permit to ripen, grows to a wonderful degree of perfection.

"Wheat especially has been produced of a superlative quality, and in such abundance, that, as is asserted, the crops have often yielded over a hundred fold. I would not have it understood, however, that this is a fair sample of New Mexican soil; for, in point of fact, though many of the bottoms are of very fertile character, the uplands must chiefly remain unproductive; owing, in part, to the sterility of the soil, but as much, no doubt, to want of irrigation; hence nearly all the farms and settlements are located in those valleys which may be watered by some constant-flowing stream.†

"The first settler of the charming valley of Taos, since the country was reconquered by the Indians, is said to have been a Spaniard named Pando, about the middle of the eighteenth century. This pioneer of the North, finding himself greatly exposed to the depredations of the Comanches, succeeded in gaining the friendship of that tribe, by promising his infant daughter, then a beautiful child, to one of their chiefs in marriage. But the unwilling maiden having subsequently refused to ratify the contract, the settlement was immediately attacked by the savages, and all were slain except the betrothed damsel who was led into captivity. After living some years with the Comanches on the great prairies, she was bartered away to the Pawnees, of whom she was eventually purchased by a Frenchman of St. Louis. Some very respectable families in that city are descended from her; and there are many people yet living who remember with what affecting pathos the old lady was wont to tell her tale of woe. She died but a few years ago.

CLIMATE OF NEW MEXICO.—"Salubrity of climate is decidedly the most interesting feature in the character of New Mexico. Nowhere—not even under the much-boasted Sicilian skies—can a purer or a more wholesome atmosphere be found. Bilious diseases—the great scourge of the valley of the Mississippi—are here almost unknown. Apart from a fatal epidemic fever of a typhoid character, that ravaged the whole province from 1837 to 1839, and which, added to the smallpox that followed in 1840, carried off nearly ten per cent of the population, New Mexico has experienced very little disease of a febrile character; so that as great a degree of longevity is attained there, perhaps, as in any other portion of the habitable world. Persons withered almost to mummies are to be encountered occasionally, whose extraordinary age is only to be inferred from their recollection of certain notable events which have taken place in times far remote.

"A sultry day, from Santa Fé north, is of very rare occurrence. The summer nights are usually so cool and pleasant that a pair of blankets constitutes an article of comfort seldom dispensed with. The winters are long, but not so subject to sudden changes as in damper climates; the general range of the thermometer, throughout the year, being from 10 deg. to 75 deg. above zero, of Fahrenheit. Baron Humboldt was led into as great an error with respect to the climate of New Mexico as to the rivers; for he remarks that near Santa Fé and a little further north, 'the Rio del Norte is sometimes covered for a succession of several years, with ice thick enough to admit the passage of horses and carriages:' a circumstance which would be scarcely less astounding to the New Mexicans, than would the occurrence of a similar event in the harbour of New York be to her citizens.

"The great elevation of all the plains about the Rocky Mountains, is, perhaps, the principal cause of the extraordinary dryness of the atmosphere. There is but little rain throughout the year, except from July to October—known as the *rainy season*; and as the Missouri traders usually arrive about its commencement, the coincidence has given

* "The *Valley of Taos*," there being no *town* of this name. It includes several villages and other settlements, the largest of which are Fernandez and Los Ranchos, four or five miles apart.

† From the generally barren and desolate appearance which the uplands of New Mexico present, some exceptions have possessed an extraordinary degree of fertility; as is demonstrated by the fact that many of the fields on the undulating lands in the suburbs of Santa Fé, have no doubt been in constant cultivation over two hundred years, and yet produce tolerable crops, without having been once renovated by manure.—*Gregg*.

rise to a superstition, quite prevalent among the vulgar, that the Americans bring the rain with them. During seasons of drought, especially, they look for the arrival of the annual caravans as the harbinger of speedy relief.

POPULATION.—“There has never been an accurate census taken of the population of New Mexico. Of the one attempted in 1832, the Secretary of State at Santa Fé, speaks in the following terms:—‘At present (1841) we may estimate the Spanish or white population at about 60,000 souls or more, being what remains of 72,000, which the census taken seven or eight years ago showed there then existed in New Mexico.’ He supposes that this great diminution resulted from the ravages of the frightful diseases already alluded to. The decrease of population from these causes, however, is greatly overrated. The discrepancy must find its explanation in the inaccuracy of the census referred to.

“If we exclude the unsubjugated savages, the entire population of New Mexico, including the Pueblo Indians, cannot be set down, according to the best estimates I have been able to obtain, at more than 70,000 souls. These may be divided as follows:—White creoles, say 1000; Mestizos, or mixed creoles, 59,000; and Pueblos, 10,000. Of naturalised citizens, the number is inconsiderable—scarcely twenty; and if we except transient traders, there are not over double as many alien residents. There are no negroes in New Mexico, and consequently neither mulattoes nor *zambos*. In 1803, Baron Humboldt set down the population of this province at 40,200, so that according to this the increase for forty years has barely exceeded one per cent per annum.

AGRICULTURE OF NEW MEXICO.—“Agriculture, like almost every thing else in New Mexico, is in a very primitive and unimproved state. A great portion of the peasantry cultivate with the hoe alone—their ploughs (when they have any) being only used for mellow grounds, as they are too rudely constructed to be fit for any other service. Those I have seen in use are mostly fashioned in this manner:—a section of a trunk of a tree, eight or ten inches in diameter, is cut about two feet long, with a small branch left projecting upwards, of convenient length for a handle. With this a beam is connected to which oxen are yoked. The block, with its fore end sloped downwards to a point, runs flat, and opens a furrow similar to that of the common shovel plough. What is equally worthy of remark is, that these ploughs are often made exclusively of wood, without one particle of iron, or even a nail to increase their durability.

“The *labores* and *milpas* (cultivated fields) are often, indeed most usually, without any enclosure. The owners of cattle are obliged to keep herdsmen constantly with them, else graze them at a considerable distance from the farms; for if any trespass is committed upon the fields by stock, the proprietor of the latter is bound to pay damages: therefore, instead of the cultivator’s having to guard his crop from the cattle as with us, the owners of these are bound to guard them from the crops. Only a chance farm is seen fenced with poles scattered along on forks, or a loose hedge of brush. Mud-fences, or walls of very large *adobes*, are also occasionally to be met with.

“The necessity of irrigation has confined, and no doubt will continue to confine agriculture principally to the valleys of the constant-flowing streams. In some places the crops are frequently cut short by the drying up of the streams. Where water is abundant, however, art has so far superseded the offices of nature in watering the farms, that it is almost a question whether the interference of nature in the matter would not be a disadvantage. On the one hand, the husbandman need not have his grounds overflowed if he administers the water himself, much less need he permit them to suffer from drought. He is, therefore, more sure of his crop than if it were subject to the caprices of the weather in more favoured agricultural regions.

“One *acequia madre* (mother ditch) suffices generally to convey water for the irrigation of an entire valley, or, at least, for all the fields of one town or settlement. This is made and kept in repair by the public, under the supervision of the *alcaldes*; labourers being allotted to work upon it as with us upon our county roads. The size of this principal ditch is, of course, proportioned to the quantity of land to be watered. It is conveyed over the highest part of the valley, which, on these mountain streams, is, for the most part, next to the hills. From this, each proprietor of a farm runs a minor ditch, in like manner, over the most elevated part of his field. Where there is not a superabundance of water, which is often the case on the smaller streams, each farmer has his day, or portion of a day allotted to him for irrigation; and at no other time is he permitted to

extract water from the *acequia madre*. Then the cultivator, after letting the water into his minor ditch, dams this, first at one point and then at another, so as to overflow a section at a time, and with his hoe, depressing eminences and filling sinks, he causes the water to spread regularly over the surface. Though the operation would seem tedious, an expert irrigator will water, in one day, his five or six-acre field, if level, and every thing well arranged; yet, on uneven ground, he will hardly be able to get over half of that amount.*

"All the *acequias* for the valley of the Rio del Norte are conveyed from the main stream, except where a tributary of more convenient water happens to join it. As the banks of the river are very low, and the descent considerable, the water is soon brought upon the surface by a horizontal ditch along an inclined bank, commencing at a convenient point of constant-flowing water—generally without dam, except sometimes a wing of stones to turn the current into the canal.

FOOD.—"The staple productions of the country are emphatically Indian corn and wheat. The former grain is most extensively employed for making *tortillas*—an article of food greatly in demand among the people, the use of which has been transmitted to them by the aborigines. The corn is boiled in water with a little lime: and when it has been sufficiently softened, so as to strip it of its skin, it is ground into paste upon the *metate*,† and formed into a thin cake. This is afterwards spread on a small sheet of iron or copper, called *comal* (*comalli*, by the Indians), and placed over the fire, where in less than three minutes, it is baked and ready for use. The thinness of the tortilla is always a great test of skill in the maker, and much rivalry ensues in the art of preparation. The office of making tortillas has, from the earliest times, pertained chiefly to the women, who appear to be better adapted to this employ than the other sex, both as regards skill and dexterity, in preparing this particular food for the table. I perfectly agree with the historian Clavigero, however, in the opinion that 'although this species of corn-bread may be very wholesome and substantial, and well-flavoured when newly made, it is unpleasant when cold.'

"A sort of thin mush called *atole*, made of Indian meal, is another article of diet, the preparation of which is from the aborigines; and such is its nationality, that in the north it is frequently called *el café de los Mexicanos* (the coffee of the Mexicans). How general soever the use of coffee among Americans may appear, that of *atole* is still more so among the lower classes of Mexicans. They virtually 'breakfast, dine and sup' upon it. Of this, indeed, with *frijoles* and *chilé* (beans and red pepper), consist their principal food. The extravagant use of red pepper among the Mexicans has become truly proverbial. It enters into nearly every dish at every meal, and often so predominates as entirely to conceal the character of the viands. It is likewise ground into a sauce, and thus used even more abundantly than butter. *Chilé verde* (green pepper), not as a mere condiment, but as a salad, served up in different ways, is reckoned by them one of the greatest luxuries. But however much we may be disposed to question their taste in this particular, no one can hesitate to do homage to their incomparable chocolate, in the preparation of which the Mexicans surely excel every other people.

"Besides these, many other articles of diet peculiar to the country, and adopted from the aborigines, are still in use—often of rich and exquisite flavour, and though usually not much relished at first by strangers, they are for the most part highly esteemed after a little use.

"The *rancheros*, and all the humbler classes of people, very seldom use any table for their meals, an inconvenience which is very little felt, as the dishes are generally served out from the kitchen in courses of a single plate to each guest, who usually takes it upon his knees. Knives and forks are equally dispensed with, the viands being mostly

* There is no land measure here correspondent to our acres. Husbandmen rate their fields by the amount of wheat necessary to sow them; and thus speak of a *fanega* of land—*fanega* being a measure of about two bushels—meaning an extent which two bushels of wheat will suffice to sow. Tracts are usually sold by the number of *leguas* (leagues), or *varas* front of irrigable lands; for those back from the streams are considered worthless. The *vara* is very nearly thirty-three English inches, 5000 of which constitute the Mexican league—under two miles and two-thirds.

† From the Indian word *metatl*, a hollowed oblong stone, used as a grinding machine.

hashed or boiled so very soft as to be eaten with a spoon. This is frequently supplied by the *tortillia*, a piece of which is ingeniously doubled between the fingers so as to assist in the disposal of any thing, be it ever so rare or liquid.

"The very singular custom of abstaining from all sorts of beverage during meals, has frequently afforded me a great deal of amusement. Although a large cup of water is set before each guest, it is not customary to drink it off till the repast is finished. Should any one take it up in his hand while in the act of eating, the host is apt to cry out, 'Hold, hold ! there is yet more to come.'

"I have never been able to ascertain definitely the meaning of this peculiarity ; but from the strictness with which it is observed, it is natural to suppose, that the use of any kind of drink whilst eating, is held extremely unwholesome.* The New Mexicans use but little wine at meals, and that exclusively of the produce of the Pasco del Norte.

VARIOUS PRODUCTIONS.—"But to return to the productions of the soil. *Cotton* is cultivated to no extent, although it has always been considered as indigenous to the country ; while the ancient manufactures of the aborigines prove it to have been especially so in this province. *Flax* is entirely neglected, and yet a plant resembling in every respect that of the *linum usitatissimum*, is to be found in great abundance in many of the mountain valleys. The potato (*la papa*), although not cultivated in this country till very lately, is unquestionably an indigenous plant, being still found in a state of nature in many of the mountain valleys—though of small size, seldom larger than filberts : whence it appears that this luxury had not its exclusive origin in South America, as is the current opinion of the present day. Universal as the use of tobacco is among these people, there is very little of it grown, and that chiefly of a light and weak species, called by the natives *punche*, which is also indigenous, and still to be met with growing wild in some places. What has in a great measure contributed to discourage people from attending to the cultivation of the tobacco plant, is the monopoly of this *indispensable* by the federal government ; for although the tobacco laws are not enforced in New Mexico (there being no *Estanquillo* or public store-house), yet the people cannot carry it anywhere else in the republic for sale, without risk of its being immediately confiscated. A still more powerful cause operating against this, as well as every other branch of agriculture in New Mexico, is the utter want of navigable streams, as a cheap and convenient means of transportation to distant markets.

FRUITS.—"Famous as the republic of Mexico has been for the quality and variety of its fruits, this province, considering its latitude, is most singularly destitute in this respect. A few orchards of apples, peaches, and apricots, are occasionally met with, but even these are of very inferior quality, being only esteemed in the absence of something better. A few small vineyards are also to be found in the valley of the Rio del Norte, but the grape does not thrive as at El Paso. The mode of cultivating the grape in these parts is somewhat peculiar, and might, I have no doubt, be practised to great advantage in other countries. No scaffold or support of any kind is erected for the vines, which are kept pruned so as to form a sort of shrubbery. Every fall of the year these are completely covered with earth, which protects them during the winter. Upon the opening of spring the dirt is scraped away, and the vines pruned again. This being repeated from year to year, the shrubs soon acquire sufficient strength to support the heavy crops of improved and superiorly-flavoured grapes which they finally produce.

"Indigenous wild fruits are not quite so scarce ; a clear evidence that the lack of cultivated fruit is not so much the fault of nature, as the result of indolence and neglect on the part of the people. The prickly pear is found in greatest abundance, and of several varieties : and though neither very wholesome nor savory, it is nevertheless frequently eaten.

"There is but little timber in New Mexico, except in the mountains and along the water-courses ; the table-lands and valleys are generally all open prairie. The forest growths, moreover, of all the north of Mexico, present quite a limited variety of timber, among which the common pitch-pine mostly predominates. The tree which appears to

* Females rarely ever eat with the males—at least in the presence of strangers—but usually take their food in the kitchen by themselves.

be most peculiar to the country, is a kind of scrub pine, called *pinon*, which grows generally to the height of twenty or thirty feet, with leaves ever-green and pine-like, but scarcely an inch long. From the surface of this tree exudes a species of turpentine, resembling that of the pitch-pine, but perhaps less resinous. The wood is white and firm, and much used for fuel. The most remarkable appendage of this tree is the fruit it bears, which is also known by the same name. This is a little nut about the size of a kidney-bean, with a rich oily kernel in a thin shell, enclosed in a chestnut-like bur. It is of a pleasant flavour and much eaten by the natives, and considerable quantities are exported annually to the southern cities. It is sometimes used for the manufacture of a certain kind of oil, said to be very good for lamps.

"The *mezquite* tree, vulgarly called *muskeet* in Texas, where it has attained some celebrity, grows in some of the fertile valleys of Chihuahua to the height of thirty and forty feet, with a trunk of one to two feet in diameter. The wood makes excellent fuel, but it is seldom used for other purposes, as it is crooked, knotty, and very coarse and brittle, more resembling the honey-locust (of which it might be considered a scrubby species) than the mahogany, as some people have asserted. The fruit is but a diminutive honey-locust in appearance and flavour, of the size and shape of a flattened bean-pod, with the seeds disposed in like manner. This pod, which, like that of the honey-locust, encloses a glutinous substance, the Apaches and other tribes of Indians grind into flour to make their favourite *pinole*. The *mezquite* seems undoubtedly of the *Acacia Arabica* species; as some physicians who have examined the gum which exudes from the tree, pronounce it genuine Arabic.

"On the water-courses there is little timber to be found except cotton-wood, scantily scattered along their banks. Those of the Rio del Norte are now nearly bare throughout the whole range of the settlements, and the inhabitants are forced to resort to the distant mountains for most of their fuel. But nowhere, even beyond the settlements, are there to be seen such dense cotton-wood bottoms as those of the Mississippi valley. Besides the common cotton-wood there is another to be found upon the mountain streams of New Mexico, which has been called willow-leaf or bitter cotton-wood (*populus augustifolia*?) and has been reckoned by some a species of cinchona, yet for no other reason perhaps than that the bark possesses efficacious tonic qualities. Attached to the seeds of this tree is also a cotton similar to that of the sweet cotton-wood, or *populus angulata*.

"Among the wild productions of New Mexico is the *palmilla*—a species of palmetto which might be termed the *soap-plant*—whose roots, as well as those of another species known as *palma* (or palm), when bruised, form a saponaceous pulp called *amole*, much used by the natives for washing clothes, and is said to be even superior to soap for scouring woollens.

PASTURES.—"Most of the high table-lands afford the finest grazing in the world, while, for want of water, they are utterly useless for most other purposes. That scanty moisture which suffices to bring forth the natural vegetation is insufficient for agricultural productions without the aid of irrigation. The high prairies of all Northern Mexico differ greatly from those of our border in the general character of their vegetation. They are remarkably destitute of the gay flowering plants for which the former are so celebrated, being mostly clothed with different species of a highly nutritious grass called *grama*, which is of a very short and curly quality. The highlands, upon which alone this sort of grass is produced being seldom verdant till after the rainy season sets in, the *grama* is only in perfection from August to October. But being rarely nipt by the frost until after the rains are over, it cures upon the ground and remains excellent hay—equal if not superior to that which is cut and stacked from our western prairies. Although the winters are rigorous, the feeding of stock is almost entirely unknown in New Mexico; nevertheless, the extensive herds of the country, not only of cattle and sheep, but of mules and horses, generally maintain themselves in excellent condition upon the dry pasturage alone through the cold season, and until the rains start up the green grass again the following summer."

The following are sketches of the parts of Mexico through which Mr. Gilliam travelled towards California, taken from his travels :

"My disagreeable journey (after leaving Durango) was continued the whole day

until my arrival at Chinacates, a rancho belonging to the estate of the Conde of Guatemépe. I dismounted at the house of the administrador before sunset. The governor was from home, but his wife came to the door and invited me in, which I did, and to my great astonishment, after I had become seated on the bench behind the long table, she took from a box a six-barrelled pistol, the only one that I had seen in the country, besides my own, and walked across the floor. I drew from my belt my pair of similar weapons and laid them upon the table, so that she might behold also that I had twelve shots, which had a desirable effect; for she appeared no sooner to discover them than she laid aside her own. The woman, I knew, did not intend hostility, but as that part of the country was very much infested with marauding land-pirates, she had ever been accustomed to be prepared to meet the worst. However, the husband soon arrived, and I fared well. My ride, the next day, was mostly upon the ridge of a mountain, which would, at times, bring me in view of the great valley of Gualamepé.

COTTON FACTORY.—“The attention of an enterprising Mexican company has, at that place, been directed to the manufacturing of cotton, and I was credibly informed by the superintendent of the factory, the company had borrowed their capital, and were enabled to make a handsome profit, *paying thirty-seven and a half per cent* upon the loan.

“Thus it can easily be perceived how dearly the Mexicans have to pay for cotton fabrics—so much for protection and home markets! The New Englander related to me what the swindler would call a smart, but to others a disgraceful account of a Mexican gentleman of Saltila, who having determined to go into the cotton manufacturing business, visited the factories of the United States for the purpose of securing perfect machinery. Upon his arrival he made, through a merchant, as his broker, a purchase of a cotton factory machine, at the cost of twenty thousand dollars, and had it shipped to his home. He also engaged an American artisan to go to Saltila and put it together. But all having arrived, upon examination it was discovered that no two wheels of the whole fabrication belonged to one another, being all mismatched, some too large and others too small, like the cannon balls that were too great for their guns, not a wheel could be turned, nor a shot fired. Thus, while the Mexican character falls short of correctness, it is nevertheless taken *advantage of sometimes*. Still it is to be hoped that the twenty thousand has never done the swindler any good.

“The Mexicans are very ingenious and apt artisans, acquiring with much celerity the skill of any of the mechanical branches. They never serve the long apprenticeships that are so common in the Union and in Europe; but having worked at a trade some one or two years, they think themselves sufficiently proficient to carry it on; and thus quit their tutor and set up for themselves.”

Mr. Gilliam then proceeded onwards over a rough country of mountains, rocks, cataracts, glens, and forests, until he ascends a height which commanded a view of the Pacific, and then descended to the mining town of Caneles, of which he says:—

“The climate of Caneles is spring and summer. Vegetables and fruits which abound in any other latitudes, are plentifully cultivated there. The trees are perpetually green; for, as fast as the leaves fade and fall, others are fresh expanding; added to which the golden harvests of the orange-tree are ever beautiful to the eye and tempting to the taste. The streets are necessarily narrow. To the inhabitants this is no inconvenience, for a wheeled vehicle of any kind has never been seen in the town; indeed, it would be impossible for one to ascend the mountain at any point.

“The mountains of Caneles have ever been celebrated, from the early discovery of the country, for abounding in silver, but from the poverty of the ore, the mines have never been extensively worked. But what has rendered the place famous as a mineral locality is, that veins of quicksilver have been found there. These have never been worked successfully. I learned that the people were much flattered with hopes, from the fact that an English company had but recently commenced opening a mercury mine, under the management of Mr. John Buchan, an Englishman.

"I was shown some specimens of quicksilver ore, of which there were two kinds. The liquid metal was contained in a soft red stone. In the first kind the mineral was not perceptible in the rock, which was only ascertained to be possessed of a foreign substance by its weight. The second and last degree of specimens differed from the first only by the mineral protruding out of the stone in small detached particles, the only contrast being, that the one was richer in mercury than the other.

"Quicksilver is never found but in secondary formations. The ore is pulverised into an impalpable powder, and the mineral is obtained by washing the offal from the silver. The inhabitants of the mines of Caneles are most grievously affected with the loathsome disease bronchocele, or goitre."

Of the difficulty of travelling towards California, he observes,—

"There were times when points of rocks or earth, sometimes steep, and at others low, had to be passed. Then the traveller would have to encounter the cat's-paw, or some other briery growth, which would tear his clothes and flesh; for all the vegetable kingdom in Mexico is thorny. Indeed the idea often strikes one, that all nature there is at war—the birds, the beasts, the creeping insects and reptiles, as well as the vegetation, are all armed for formidable aggression and defence; and yet, above every other consideration, man, who should be lord and subduer of uncultivated nature, is the bane over all, for he excels in his unkind and hostile deeds. The traveller has to spend the night at some narrow nook that may promise scanty picking for his animals, and safety for himself. He does not proceed more than half a day down the river before he perceives that the mountain-sides, which will admit of growth, are covered with forests of log-wood.

"The town of Topic is a rich *mineral*, situated upon a high mountain, fifteen miles north of Caneles. It is a place of great antiquity, and has three times been destroyed by the Indians; to this day, bars of silver, that were buried under its ruins, are found; while silver bullets are ploughed up in the fields. Since I have mentioned the subject of ploughing, I will remark, that I made inquiries as to the mode of cultivating the land in the cold regions of Madre Monte, and was informed, that there lived in those mountains some Indians who have not been civilised, who are in the habit of planting their corn to a depth beyond the influence of the cold. Sometimes, I was told, they were known to have planted the grain as low as two feet under the earth, and if it should germinate and sprout to the surface, before the season of frost has passed, and be nipped down, the warm earth beneath would nourish the roots, and cause them to again grow up to perfection. Thus while the roots of corn are in a warm region, the stalk and fruit are nourished in a colder clime."

Travelling down along a river from Topic, for three days among rocks and water, and enclosed between mountains, he at length arrived in a country, of which he says:—

"The forests, a perfect medley in every direction, by their growth being so indiscriminately mixed, that the whole woods were thickly matted, and almost impenetrable, save by the paths of ancient usage. The birds, too, of many descriptions, strange to me, were merrily singing—the flocks of paroquets of many species, drowning, by their wild and frantic screams, the melodies of the other portion of the feathered tribe. There were some birds that particularly attracted my attention—the chechalaca, or pheasant; to me it resembled more the guinea-fowl than any other bird I was acquainted with, being symmetrically and beautifully proportioned—its plumage was dark with slight variations of shade, and although wild in its native state, no fowl is more capable of being rendered domestic."

TAMAZULA, a town at which he stopped, appeared to be rapidly declining, and contained about 1000 inhabitants. It is situated on the same river as Caneles. The inhabitants are hospitable, and the "curate gave a brilliant ball."

"Although the curate seemed to be a man of about sixty years of age, his person was singularly well proportioned and handsome. His elegance of manners and splendid

waltzing, appeared to me, notwithstanding he was a curate, to be more becoming in him, than any other individual I ever beheld. Two of his daughters, as also one of the priests of the town, were at the entertainment. The young ladies were as modest, beautiful, and accomplished as any others I saw; insomuch that they far eclipsed all others in the room, on that truly joyous occasion.

"It may appear remarkable to the Christians of the United States that the clergy of Mexico should have children, but I can assure them, that they may have no doubt on that score; for no truth is of more acknowledged publicity, and nothing is more common than for the favourite unmarried wives to live with the holy fathers—at the same time their families are better educated and provided for, as a community, than any others in all Mexico.

"TAMAZULA is situated on what is called the Tamazula river; it being the same stream that floods out of the Madre Monte, upon which Caneles is built; but from the junction of the Umayá with it, it assumes the name of Culiacan, and continues to be a deep broad stream, until it arrives upon the plain next to the ocean. It there sinks, and is absorbed by the sand; and mouths in the Pacific—an insignificant river.

"CULIACAN, situated near the union of the Umayá and Tamazula rivers; contains about 5000 inhabitants; is the capital of the department of Sinaloa. The city does not differ in its appearance, or in the character of its people, from any other capital of Mexico. But there, as in the other cities, the priests, with their broad-brimmed shovel hats, and the military, have congregated to take care of the souls and weal of their dear people!

"COSALA is situated about one day's journey south from Culiacan, and from Cosala it is but two days' journey further to the port of Mazatlan on the Pacific Ocean. Mazatlan is entirely defenceless from the surges and winds of the ocean, not possessing any of the attributes of a good harbour, and is unsafe for shipping, by its having a large rock immediately before the town, upon which vessels founder in time of storms. However, Mazatlan is the principal commercial port on the Mexican coast, on the Pacific Ocean. It contains about 5000 inhabitants, composed of every people from the four quarters of the globe, and seems to have been an attractive point for all the varieties of the human family. I imagine that the same number of people can hardly be found, where there is such a farrago of complexions and tongues.

"MAZATLAN is the principal stopping point in a voyage from China, by way of the Sandwich Islands, to the United States and Europe. The scale and the shell-fish of the Pacific coasts are abundant and excellent. There is a blue-gilled oyster caught upon this coast, equal to any of those in the Chesapeake bay. The Mexicans of the Pacific have a manner of preserving them, different from any other mode I ever heard of. Immediately upon taking them from the water, they are thrown upon the fire, and when roasted until the shell opens, the oyster is salted and dried. Put up in this manner it will soundly keep in any climate, just like the mackerel that are barrelled up in salt.

"On the plains of the Pacific coast I enjoyed perspiration, the atmosphere being more dense and humid than in the interior, and the heights of little elevation. Instead of the south-west winds having always a refreshing coolness in them, it was not unfrequently the case that they resembled the monsoons of the east.

"GUADALOUPE DE CALVO is a town of about 10,000 inhabitants. It is situated about two days' journey north of Tamazula. It is, I was informed, of only ten or twelve years' existence, and its great population can only be accounted for from the fact that people congregate at such places where minerals are in successful operation. The silver mines here are worked by an English company, under the management of Mr. John Buchan. The mines yielded very profitably, but the ore was becoming poor. The enterprising agent informed me that it was his intention to seek new veins, and abandon those of Guadaloupé de Calvo.

"The houses of Guadaloupé are covered with shingles, and the windows had sashes and glass in them, as the English were the first builders there, and besides, timber is plentiful in the mountains.

"The mountain regions around Guadaloupé abounded in very rich silver ore. An English gentleman related to me an interesting account of the richest vein of silver, perhaps, that was ever opened. At a place called Refugia (the Refuge), an Indian, who followed the trade of making pack-saddles, having ascended a mountain in search of a

particular kind of grass, which he used for the purpose of stuffing, perceived, under a turf, a rock matted to a bunch of roots. Upon examining the stone, he found that it was heavier than rocks of that size generally are, and exhibited the specimen to a Spaniard, who informed him that it was one-half silver.

"The liberal Indian told the Spaniard where he had made the valuable discovery, and offered him a free gift of one-half of his right in the mine. The partners, with buoyant hopes, commenced proving the value of their enterprise, which resulted in the entire vein being one-half silver, and the other half stone. After they had extracted several millions of dollars of the precious metal, the mine became impoverished, and was abandoned, and the Indian and his partner were left worse off than when they first began to try their fortune. They were remarkably industrious in squandering their money faster than it could be dug from the earth.

"The inland road to California is direct from Guadaloupé de Calvo, north-west to the mouth of the Colorado river, where it enters into the Gulf of California. This way is like the most of all others of the Mexican roads, being nothing more than Indian trails, travelled only by animals, and never by carriages.

"The country between Guadaloupé de Calvo and the Colorado river is much infested by the Apache Indians, who are very barbarous, often cutting off the nose and ears of travellers, close to the head, and then turning them loose to their fate.

"The ports of Mazatlan and Guaymas are the usual ports of embarkation to Lower and Upper California, by the way of the ocean.

"At GUANOSEBI all of the rocks upon and under the surface of the earth, partake more or less of silver. Mr. Buchan informed me that he should open a mine at that place, which he thought would be profitable.

"After the general and the priest, the lawyer is the most formidable personage in Mexico. Mr. Buchan related that, in consequence of the many difficulties which originate in transacting business with the Mexicans, he found it to be a matter of both importance and profit to employ, continually, on behalf of the company, a lawyer; by doing which he only found it necessary, in the commencement of difficulties with obstreperous customers, to call into his presence his lawyer, and all obstacles were removed.

MAILS.—"The mails of Mexico are most generally carried by Indians on foot, who transport them, from post to post, more speedily than it could be by horses. An Indian, with his small wallet of corn-meal, and his little package of letters, will take his straight course over mountain, hill, and dale, that cannot be travelled by animals, and by that means shorten the distance, overcoming space in a wonderful manner. The robbers never molest them, for money is never carried in the mails, or the Indians possessed of valuables.

On the 30th of May, Mr. Gilliam commenced his homeward journey by way of Tampico, distant from Caneles about 1700 miles. The first place he arrived at was "the hacienda of Casa Blanca which was under the least improved condition of any that I had an opportunity of examining in all Mexico. In the first instance, there was an irrigating dam of water, one league and a half in extent. It was formed by a wall of earth and stone, built from hill to hill, and was filled by the rains. The water had, up to the time of my visit, been turned from it in a stream of eighteen inches in diameter, for a period of six weeks, to water the various parts of a corn-field—two leagues and a half square.

"The water was conducted over the land by canals, and turned upon the furrows by flood-gates at intervals, the canals running along the higher elevation of the farm. There was corn sealed up in many cone-like houses of from one to three years of age. There were other extensive lands used for pasturing purposes, upon which hundreds of animals grazed. There was at the principal granary a stack of what the Mexicans call fodder at least fifty feet high and 300 feet in length. *Oca*, fodder, in Mexico is the stalk with the blade not cured separately, but cut altogether.

"Indeed, I have, in the hot damp valleys, seen corn that had been thickly sown for the purpose of making fodder. The estate belonged to one of the most enterprising and speculating citizens of Mexico. I was informed that he once bought 2000 old horses, at

two dollars each, and that when they were boiled into soap, they averaged him fifteen dollars a-piece.

"A day's journey, to my great joy, put me on the east side of the Cordilleras, where, perhaps, lies buried more of the precious metals than the world will ever have industry sufficient to excavate; for it seemed as if silver ran through their whole extent.

"The night of my first day's travel was most disagreeably spent at a wretched rancho in a deep glen. I had directed my servants to put up my carteras under a beautiful musquite-tree that stood before the door of a small filthy house, but by the time they commenced their work, a cloud suddenly sprung up, and the kind Mexicans invited me to lodge within doors. At the time I felt very grateful, but no sooner did the rain begin to pour down, than it ran through the flat roof and flooded in at the walls. I had my guns and pistols wrapped up in the buffalo robes to keep them dry: at the same time, however, I did not part with those around my body. The buckle of my belt was never disturbed, except to draw it tighter, when I was pinched with hunger, or overpowered with fatigue; indeed, from the commencement to the end of my journey, it was lengthened about six inches, leaving me but the shadow of my original self.

"Our journey lay across the dominions of the Conde de Coral, the most wealthy of all the citizens of Mexico, as I was informed. Ever since I had left the Cordilleras on my rear, my direction was a little south of due east. As I progressed, it was observable that I was rapidly descending from an elevated to a lower region; for the towering peaks of the back-bone mountains were lost to my view, while the distant points of others would anon show their heads, in a country far below the elevation that I was on. I remarked that the end of each day's journey would place me upon a declivity, beneath that of the former one. In one instance, my entire day's travel was in the evening closed by abruptly descending a short height, which put me upon a plain as much below the former one, as was the elevation of the hills to my rear.

"These plains are chiefly wooded with palm-trees, apparently not possessing the sterility of the table-lands of the Cordilleras.

"On the 14th, I arrived at the mineral town of Los Angeles. I had, ever since the commencement of my journey from Casa Blanca, been descending to a hot region, and at Matehuala I found fruits and vegetables in abundance. The sweet orange and the lemon, the pine-apple and the banana, the plantains, plums, pears, peaches, and water-melons also were abundant. I obtained, also, some delightful lettuce, cucumbers, and tomatoes, which I found most congenial to my appetite; for, when travelling, I could never buy vegetables, excepting in the towns.

"The priests in Mexico are not the only people who make a commerce of their religion. It is the privilege of any individual to hawk about saints, for money-making.

"For seven days after my departure from Matehuala, my direction was nearly east, over a country for the most part rolling, and better wooded than any other of the table-lands I had seen in Mexico. Every thing seemed to pass off *bueno*, as the clerk had it. I noticed that my men appeared to know every person they met, and that I was greeted by all in a manner to which I had not formerly been used in the country. One of my men was a merry little fellow, who was perpetually whistling and singing. He was very expert with the lasso, never suffering a horse, mule, or steer, to escape him. He would heave at all animals that came in his way, and some of his rencontres were very exciting.

"The atmosphere in the more arid portions of the country, is of such a drying nature that animal matter shrinks and dries rather than consume by putrid decomposition.

"On the 25th, I arrived at the town of Tola, a place containing about 2000 inhabitants, and situated on an uneven and confined narrow slip of land, between two hills. At Tola I drank some excellent water. I also bought some good wine, and laid in a plentiful store of provisions, to last me until I should arrive at Tampico.

"On the morning of the 26th, after travelling two leagues over a fertile and highly cultivated country. I discovered that a mountain of considerable magnitude lay before me, over which the road wound. My journey was most disagreeable, for the recent rains had made the black mould of the earth very miry, and between mud and stone alternately, our animals progressed very slowly, and with much difficulty. Yet my journey was not without its interest, for the mountain was covered with the most magnificent forest of live oak that I ever beheld.

"After fording a small river at the foot of the mountain, we travelled along an uneven and well-watered valley for about one hour, when we again commenced ascending a higher mountain. So precipitate was the height, that one-half of the day was consumed in gaining its summit by the zig-zag and narrow path.

"The rains that had fallen had given to the abundant vegetation a most perfect green aspect; while the farm-houses, with their sharp thatched roofs, had a picturesque and romantic appearance.

"Having descended about half-way down the steep, my men all suddenly dismounted, when I perceived other travellers on foot. I was not long in discovering the object of the halt, for the arrieros gravely took off their hats, and having ascended a rude flight of steps for about twenty feet, they entered a small cavern in a large rock, and kneeled before an image. After praying devoutly, each one left a small piece of money on a niche in the cave.

"Upon inquiry, I ascertained that the image worshipped in the grotto, was the protecting saint of travellers against ladrones. Many were the 'hair-breadth escapes' related of travellers, through the instrumentality of that deity. Marvellous, indeed, are the wonder-working powers of many of the saints of Mexico!"

Within three leagues of Tampico, the lands were heavily loaded with iron-wood and fustic. On the 31st of June, he arrived at Tampico, having travelled about 4000 miles.

CHAPTER X.

SKETCHES OF THE DEPARTMENT OF MEXICO.—MR. MAYER'S EXCURSIONS.

THE following extracts from Mr. Mayer's work, during excursions made from the capital to various neighbouring districts, conveys the most recent information of these parts and of the inhabitants.

"A party," says Mr. Mayer, "in better spirits never set out. We had the prospect of relaxation, the sight of something novel, and the hope of propitious skies.

"As the cathedral clock struck four we put our animals in motion—*sed vana spes!* A cloud, which had been for some time threatening, opened its bosom. In one moment our serapes were on, the armas de agua tied round our waists, and the storm of wind and rain was upon us. We consoled ourselves by thinking it was only the baptism of the expedition.

"The road over the plain was no longer a highway but a water-course, rushing and gurgling over every descent. The poor Indians returning from market paddled along, shrouded up in their *petates*. At the city gate the guard of custom-house officers wished to charge an export duty on our wine, but our passes from M. de Bocanegra and the governor saved us, and we launched forth on the road to St. Augustin, with the shower increasing every minute. It is useless to say more of this dreary evening. For three hours the rain was incessant; and that the rain of a tropical storm, with huge drops, and wind and lightning. The water flowed from our blankets like spouts.

"It was quite dark when our cold, weary, and uncomfortable party entered St. Augustin and knocked at the gate of Mr. M——'s country-house, where we were to stay for the night. We hoped to find every thing duly prepared for our reception; and among our hopes, not the least was for a blazing fire to dry our bespattered garments. We came up to the door, one by one, silently and surlily. We were not only angry with the weather, but seemed to be mutually dissatisfied. After a deal of thumping, the door was slowly opened, and instead of the salutation of a brilliant blaze in the midst of the court-yard—one miserable, sickly tallow candle made its appearance! A colder, damper, or more un-

comfortable crew never reunited after a storm ; and we found, notwithstanding the usual protection of Mexican blankets, Mexican saddles, and *armas de agua*, that the rain had penetrated most of our equipments, and that we were decidedly damp, if not thoroughly drenched.

" We entered the house after disposing of our accoutrements in a large hall, and found quite comfortable quarters and beds enough for all parties. A change of dress, a glass of capital *Farintosh* (which was produced from the capacious leathern bottle of Douglas), and a cut at the ham, with a postscript of cigars, set us all to rights again ; and at eleven o'clock, as I write this memorandum, the party are singing the chorus of a song to Du Roslan's leading.

SUNDAY.—" As the bells were ringing for mass, and the villagers hurrying through the streets to church, we sallied forth, every man trying to discover the symptom, even, of a break among the dreary brownish clouds that hung low from the mountain-tops to the valley.

" As soon as the road leaves the town of St. Augustin, it strikes directly up the mountain, and runs over crags and ravines which in our country would startle the delicate nerves of a lady. Railroads and McAdam have spoiled us ; but here, where the toilsome mule and the universal horse have converted men almost into centaurs and are the traditional means of communication, no one thinks of improving the highways. But, of late years, diligences are getting into vogue between the chief cities of the republic ; and one, built in Troy, has been started on this very road. How it gets along over such ruts and drains, rocks and mountain-passes, it is difficult to imagine !

" On we went, however, over hill and dale, the misty rain still drifting around us, and becoming finer and mistier as we rose on the mountain. The prospect was dreary enough ; but in fine weather these passes are said to present a series of beautiful landscapes. In front is then beheld the wild mountain scenery, while, to the north, the valley sinks gradually into the plain, mellowed by distance, and traversed by the lakes of Chalco and Tezcoco. Of the former of these we had a distinct view as the wind drifted the mist aside for a moment, when we had nearly attained the summit of the mountain. Here we passed a gang of labourers impressed for the army, and going *tied in pairs*, under an escort of soldiers, to serve in the capital. This was *recruiting* ! Further on, we passed the body of a man laying on the side-path. He had evidently just died, and, perhaps, had been one of the party we had encountered. No one noticed him ; his hat was spread over his face, and the rain was pelting on him.

" We saw no habitations, no symptoms of cultivation ; in fact, nothing except rocks and stunted herbage, and now and then a muleteer, a miserable Indian plodding with a pannier of fruit to Mexico, or an Indian shepherd-boy, in his long *thatch-cloak* of water-flags, perched on a crag and watching his miserable cattle. We were now travelling among the clouds, near 9000 feet above the level of the sea.

" After about four hour's journey in this desolation, the clouds suddenly broke to the southward, revealing the blue sky between masses of sullen vapour, and thus we reached our breakfasting house on the top of the mountain.

MEXICAN FARE.—" Imagine a mud-hole (not a regular lake of mud, but a mass of that clayey, oozy, grayish substance, which sucks your feet at every step), surrounded by eight huts, built of logs and reeds, stuck into the watery earth, and thatched with palm leaves. This was the stage breakfasting station, on the road from Mexico to Cuernavaca. We asked for '*the house* ;' and a hut, a little more open than the rest, was pointed out. It was in two divisions, one being closed with reeds, and the other entirely exposed, along one side of which was spread a rough board supported on four sticks covered with a dirty cloth. It was *the principal hotel* !

" We asked for breakfast, but the answer was the slow movement of the long forefinger from right to left, and a '*No hai !*' '*Any eggs ?*' '*No hai.*' '*Any tortillas ?*' '*No hai.*' '*Any pulqué ?*' '*No hai.*' '*Any chilé ?*' '*No hai.*' '*Any water ?*' '*No hai !*' '*What have you got then ?*' exclaimed we, in a chorus of desperation. '*Nada !*'—nothing.

" We tried to coax them, but without effect ; and, at length, we ordered a mule to be unladen and our own provisions to be unpacked. This produced a stir in the household, as soon as it became evident that there was to be *no high bid* for food.

"In a moment I found a couple of women at work, one grinding corn for tortillias, and the other patting them into shape for the griddle. At length a girl arose, and after rummaging, produced a couple of eggs, which she said should be cooked for me. I thanked her, and by a little persuasion, induced her to add half-a-dozen more for the rest of the party. By the time that the eggs were boiled and the tortillias baked, I suggested that a dish of *mollé de guagelote* would be delicious with them. The result was the discovery of a pan heaped with the desired turkey and chilé, and another quite as full of delicious frijoles. These were placed for five minutes over the coals, and the consequence was, that out of '*Nada*,' I contrived to cater a breakfast that fed our company, servants, and arriero, and which would have doubtless fed the mules also, if mules ever indulged in chilé. I never made a heartier meal, relishing it greatly, in spite of the dirty-table cloth, the dirty women, and the dirty village.

"About one o'clock we had again mounted, and riding along a level road which winds through the table-land of the mountain-top, we passed the Cruz del Marquez, a large stone cross set up not long after the conquest to mark the boundary of the estate presented by Montezuma to Cortez. At this spot the road is 9500 feet above the level of the sea, and thence commences the descent of the southern mountain-slope toward the Vale of Cuernavaca. The pine forest in many places is open and arching, like a park, and covers a wide sweep of meadow and valley. The air soon became milder, the sun warmer, the vegetation more varied, the fields less arid, and yet all was forest scenery, apparently untouched by the hand of man. In this respect it presents a marked difference from the mountains around the Valley of Mexico, where the denser population has destroyed the timber and cultivated the land.

"The road is remarkable for being infested with robbers, but we fortunately met none, we were probably too strong for the ordinary gangs, some fifty shots from a company of foreigners, with double-barrelled guns and revolving pistols, being dangerous welcome.

"After a slow ride during the afternoon, we suddenly changed our climate. We had left the *tierras frias* and *tierras templadas* (the cold and temperate lands), and had plunged at once, by a rapid descent of the mountain, into the *tierra caliente*, where the sun was raging with tropical fervour. The vegetation became entirely different and more luxuriant, and a break among the hills suddenly disclosed to us the valley of Cuernavaca, bending to the east with its easy bow. The features of this valley are entirely different from those of the valley of Mexico, for, although both possess many of the same elements of grandeur and sublimity, in the lofty and wide sweeping mountains; yet there is a southern gentleness, and purple haziness about this, that softens the picture, and are wanting in the Vale of Mexico, in the high and rarefied atmosphere of which every object, even at the greater distance, stands out with almost microscopic distinctness. Besides this, the foliage is fuller, the forests thicker, the sky milder, and every thing betokens the sway of a bland and tropical climate.

"A bend of the road around a precipice, revealed to us the town of Cuernavaca, lying beyond the forest in the lap of the valley, while far in the east the mountains were lost in the plain, like a distant line of sea. Our company gathered together on the announcement of the first sight of our port of destination for the night. It was decided by the novices in Mexican travelling, that it could not be more distant than a couple of leagues at furthest; but long was the weary ride, descending and descending, with scarcely a perceptible decrease of space before we reached the city.

"In the course of this afternoon we passed through several Indian villages, and saw numbers of people at work in the fields by the road side. Two things struck me; first, the miserable hovels in which the Indians are lodged, in comparison with which a decent dog-kennel at home is a comfortable household; and second, the fact that this, although the Sabbath, was no day of repose to these ever-working, but poor and thriftless people. Many of the wretched creatures were stowed away under a roof of thatch, stuck on the bare ground, with a hole left at one end to crawl in!

APOLOGY FOR SLAVERY.—"What can be the benefit of a republican form of government to masses of such a population? They have no ambition to improve their condition, or in so plenteous a country it would be improved; they are content to live and lie like the beasts of the field; they have no qualifications for self-government, and they can have no hope, when a life of such toil avails not to avoid such misery. Is it possible for such

men to become republicans? It appears to me that the life of a negro, under a good master in our country, is far better than the beastly degradation of the Indian here. With us, he is at least a man (?); but in Mexico, even the instincts of his human nature are scarcely preserved.

"It is true that these men are *free*, and have the unquestionable liberty, after raising their crop of fruits or vegetables, to trot with it fifty or sixty miles, *on foot*, to market; where the produce of their toil is, in a few hours, spent, either at the gambling-table or the *pulqué* shop. After this they have the liberty, as soon as they get sober, to trot back again to their kennels in the mountains, if they are not previously *lassoed* by some recruiting sergeant, and forced to 'volunteer' in the army. Yet what is the worth of such *purposeless* liberty or the worth of such purposeless life? There is not a single ingredient of a noble-spirited and high-minded *mountain peasantry* in them. Mixed in their races, they have been enslaved and degraded by the conquest; ground into abject servility during the colonial government; corrupted in spirit by the superstitious rites of an ignorant priesthood; and now, without hope, without education, without other interest in their welfare, than that of some good-hearted village curate, they drag out a miserable existence of bestiality and crime. Shall such men be expected to govern themselves?

"It was long after sunset when we descended the last steep, and passed a neat little village, where the people were sitting in front of their low-roofed houses, from every one of which issued the tinkle of guitars. The bright sky reflected a long twilight, and it was just becoming dark when we trotted into Cuernavaca, after a ride of fourteen leagues.

HOTEL ACCOMMODATIONS.—"Our companions had already reached the inn, and as we dashed into the court-yard, we found them *à tort et à travers* with the landlord about rooms. We had seen a flaming advertisement of this tavern and its comforts in the papers of the capital, and counted largely on splendid apartments and savoury supper after our tiresome ride and pic-nic breakfast. But, as at the 'diligence hotel' in the morning, everything went to the tune of '*No hai!*' No hai beds, rooms, meats, soups, supper—nada! They had nothing! We ended by securing two rooms, and I set out to examine them, as well as my legs (stiff from being all day in the hard Mexican stirrups) would let me. The first room I entered was covered with water from the heavy rains. The second adjoined the first; and although the walls were damp, the floor was dry; but there was no window or opening except the door.

"We had secured the room, and of course wanted *beds*; because, room and bed, and bureau, and wash-stand, and towels, and soap, are not all synonymous here as in other civilised countries. Four of our travellers had fortunately brought cots with them: but I had trusted to my two blankets and my old habits of foraging. At length the master managed to find a bed for two more of us, and a cot for me, and thus the night was provided for. We had resolved not to go without supper, and I was despatched to the kitchen. I will not disclose the history of my negotiations on this occasion, but suffice it to say that in an hour's time we had a soup; a fragment of stewed mutton; a dish of Lima beans; a famous dish of turkey and peppers, and the table was set off by an enormous head of lettuce in the centre, garnished with outposts of oranges on either side, while two enormous pine-apples reared their prickly leaves in front and rear.

"An hour afterward we had all retired to our windowless room, and after piling our baggage against the door to keep out the robbers, I wrapped myself in my blanket, on the bare, pillowless, sacking-bottom, and was soon asleep.

CUERNAVACA "lies on a tongue of land jutting out into the lap of the valley. On its western side, a narrow glen has been scooped out by the water which descends from the mountains, and its sides are thickly covered with the richest verdure. To the east, the city again slopes rapidly, and then as rapidly rises. I walked down this valley street past the valley church built by Cortez (an old picturesque edifice filled with nooks and corners), where they were chanting a morning mass. In the yard of the palace, or *Casa Municipal*, at the end of the street, a body of dismounted cavalry soldiers were going through the sword exercise. From this I went to the plaza in front of it, at present nearly covered with a large wooden amphitheatre, that had been devoted to bull-fights during the recent national holidays. Around the edges of this edifice, the Indians and small farmers spread out their mats, covered with fine fruits and vegetables of the

tierra caliente. I passed up and down a number of the steep and narrow streets, bordered with ranges of one-story houses, open and cool, and fronted usually with balconies and porches screening them from the scorching sun. The softer and gentler appearance of the people, as compared with those of the Valley of Mexico, struck me forcibly. The whole has a Neapolitan air. The gardens are numerous and full of flowers. By the street sides small canals continually pour along the cool and clear waters from the mountains.

"The beautiful suburbs of Cuernavaca are chiefly inhabited by Indians, whose houses are built along the narrow lanes; and in a country where it is a comfort to be all day long in the open air under the shade of trees, and where you require no covering except to shelter you in sleep and showers, you may readily imagine that the dwellings of the people are exceedingly slight. A few canes stuck on end, and a thatch of cane, complete them.

"But the broad-leaved plantain, the thready pride of China, the 'feathery palm,' bending over them, and matted together by lacing vines and creeping plants covered with blossoms—these form the real dwellings. The whole, in fact, would look like a picture from 'Paul and Virginia'—but for the figures! 'Unkempt' men, indolent and lounging; begrimed women, surrounded by a set of naked little imps as begrimed as they; and all crawling or rolling over the filth of their earthen floors, or on dirty hides stretched over sticks for a bed. A handful of corn, a bunch of plantains, or a pan of beans picked from the nearest bushes, is their daily food; and here they burrow, like so many animals, from youth to manhood, from manhood to the grave.

"After leaving the city, our road lay for some distance along the high table-land, and at length struck into the glen which passes from the west of Cuernavaca, where, for the first time in Mexico, I actually lost the high-road. Imagine the channel of a mountain-stream down the side of an Alleghany mountain, with its stones chafed out of all order, and many of them worn into deep clefts by the continual tread of mules following each other, over one path, for centuries. This was the main turnpike of the country to the port of Acapulco, and several of our party managed to continue on horseback while descending the ravine.

"This (the hacienda of Temisco) is one of the oldest establishments of note in the republic, and passed, not many years since, into the hands of the present owners for the sum of 300,000 dollars. The houses (consisting of the main dwelling, a large chapel, and all the requisite out buildings for grinding the cane and refining the sugar) were erected shortly after the conquest, and their walls bear yet the marks of the bullets with which the refractory owner was assailed during one of the numerous revolts in Mexico. He stood out stoutly against the enemy, and mustering his faithful Indians within the walls of his court-yard, repulsed the insurgents.

"This (the hacienda of Cocoyotla) is a small, but one of the most beautiful estates in the *tierra caliente*. A handsome chapel-tower has recently been added to the old edifice; a wing on broad arches has been given to the dwelling, and the garden is kept in tasteful order.

"Back of the house and bordering the garden, sweeps along a sweet stream, some twenty yards in width, and, by canals from it, the grounds are plentifully supplied with water. But the gem of Cocoyotla is the orangery. It is not only a grove, but a miniature forest, interspersed with broad-leaved plantains, guyavas, cocos, palms, and mammeis. It was burdened with fruits; and a multitude of birds, undisturbed by the sportsman, have made their abodes among the shadowy branches.

"We sauntered about in the delicious and fragrant shade for half an hour, while the gardener supplied us with the finest fruits. We were then summoned to an excellent breakfast of several courses, garnished with capital wine.

"When our repast was concluded, Senor Sylva conducted us over his house; showed us the interior of the neat church, where he has made pedestals for the figures of various saints out of *stalactites* from some neighbouring cavern; and finally dismissed us, with sacks of the choicest fruit, which he had ordered to be selected from his grove."

A RANCHO, OR FARMHOUSE.—"Our journey from the hacienda (Cocoyotla) was toward the Cave of Cacahuawamilpa, which we propose visiting, and we have reached, to night, the rancho of Michapas.

"This is a new feature in our travels. Hitherto we have been guests at haciendas and comfortable town dwellings, but to-night we are lodged in a rancho—a small farmer's dwelling—an Indian hut.

"We arrived about five o'clock, after a warm ride over wide and solitary moors, with a background of the mountains we passed yesterday. In front another sierra stretches along the horizon; and in the foreground of the picture, a lake, near a mile in circuit, spreads out its silver sheet in the sunset, margined with wide-spreading trees and covered with water-fowl.

"The house is built of mud and reeds, matted together; that is, there are four walls without other aperture but a door, while a thatch, supported on poles, spreads on either side from the roof-tree, forming a porch in front. This thatch is not allowed to touch the tops of the walls, but between them and it, all around the house, a space of five or six feet has been left, by means of which a free circulation of air is kept up within. The interior (of one room) is in perfect keeping with this aboriginal simplicity. Along the western wall there are a number of wretched engravings of saints, with inscriptions and verses beneath them; next, a huge picture of the Virgin of Guadalupe, with tarnished gilded rays, blazes in the centre; and near the corner is nailed a massive cross, with the figure of our Saviour apparently bleeding at every pore. A reed and spear are crossed below it, and large wreaths and festoons of marigolds are hung around. Six tressels, with reeds spread over them, stand against the wall; and in one corner a dilapidated canopy, with a tattered curtain, rears its pretentious head to do the honours of state-bedstead. The floor is of earth, and, in a corner, are safely stowed our saddles, bridles, guns, pistols, holsters, swords, and spurs—so that taking a sidelong glance at the whole establishment, you might well doubt whether you were in a stable, church, sleeping-room, or chicken-coop!

"Don Miguel Benito—the owner and proprietor of this valuable catalogue of domestic comforts—received us with great cordiality. He is a man some fifty years of age; delights in a shirt, the sleeves of which have been so long rolled up, that there is no longer any thing to roll down; and a pair of those elastic leather breeches that last one's lifetime in Mexico, and grow to any size that may be required, as the fortunate owner happens to fatten with his years. Not the least curious part of Don Miguel's household, is his female establishment. He appears to be a sort of Grand Turk, as not less than a dozen women, of all colours and complexions, hover about his dwellings; while at least an equal number of little urchins, with light hair and dark (but all with an extraordinary resemblance to the Don,) roll over the mud-floors of the neighbouring huts, or amuse themselves by *lassoing* the chickens.

"—— The caterer of our mess, thought it but a due compliment to Don Miguel (who does not disdain to receive your money) to order supper—though we resolved to fall back, in case of necessity, upon our own stores, and accordingly unpacked some pots of soup and sardines.

"In the course of an hour, a board was spread upon four sticks, and in the middle of it was placed a massive brown earthen platter, with the stew. At the same time, a dirty copper spoon and a hot tortillia were laid before each of us. Although we had determined to hold ourselves in reserve for our soups, yet there was but little left of the savoury mess. Our turtle, flanked with lemons and claret, then came into play; and the repast was ended by another smoking platter of the universal frijoles (beans).

"Wild and primitive as was the scene among these simple Indians, I have seldom passed a pleasanter evening, enlivened with song and wit. When we crept to our reed tressels and serapes, at eleven o'clock, I found that the state-bed was already occupied by a smart-looking fellow from the West Coast (who I take to have been rather deeply engaged in the contraband) and his young wife—a lively looking lass, rather whiter than the rest of the brood—who had spruced herself up on our arrival. Twelve of our party lodged together in that capacious apartment, while Don Miguel betook himself, with the rest of his household, to mats under the porch.

"It rained heavily last night (22nd September), but the morning, as usual, was fresh, clear, and warm. After a cup of chocolate, we sallied forth toward the Cave of

Cacahuawamilpa, having previously despatched our arriéros with the mules to Tetecala, to await our return on our journey toward Cuautla.

"Our forces this morning were increased by the addition of some twelve or thirteen Indians, who had been engaged by Don Miguel to accompany us as guides to the cavern. They bore with them the rockets and torches which were to be burned within, and a large quantity of twine for threading the labyrinth.

"Leaving the lake, situated on the very edge of the table-land, we struck down a deep barranca, at the bottom of which our horses sunk nearly to their girths at every footstep, in an oozy marsh, that had not been improved by last night's rain. But passing these bogs, we ascended a steep line of hills, whence there was a splendid view of the snow-capped volcanos of Puebla, and soon reached the Indian village of Totlahwamilpa, where it was necessary to procure a 'licence' to visit the cavern; or, in other words, where the authorities extort a sum of money from every passenger, under the plea of keeping the road open, and the entrance safe. As we had special passports from the Mexican government to go where we pleased in the *tierra caliente*, I thought this precaution unnecessary, but our Indians refused to budge a peg without a visit to the *alcaldé*; and therefore, while some of the party entered a hut, and set the women to cooking tortillas, others proceeded with the passports to the civic authorities."

The following is the most pleasing description of any part of Mexico which we have met with:—

"We left Tetecala this morning (23rd September), at eight o'clock, with the intention of passing to-night at the hacienda of St. Nicolas. For the present, at least, we seem to have done with the mountains, as our road to-day lay entirely over the plain. During the three last days, we have been wandering among gigantic mountains and over wild moors, where the solitude of nature reigns in all its majesty; but the picture varies in the direction of *CUAUTLA*. The mountains sink into the plain, and the plain is rich, fertile, and cultivated with the nicest economy.

"About twelve o'clock we saw the hacienda lying in the distance, in the lap of the plain, with a small hill or two hard by, just large enough to vary the scenery. As we approached the white-walled buildings, we could not help remarking the uncommonly neat appearance of every thing about the estate. The sugar-fields were in capital order, the roads smooth, the fences had been put up, the cattle were under the care of men. The Indian village, inhabited by many of the labourers on the estate, was tidy and comfortable, and there was a cleanness and decency in the appearance of the people that I had not seen elsewhere. Indeed, the whole view of this plain, hemmed in by the distant summits of the mountains, reminded me strongly of some of the pictures of rural beauty constantly presented to the traveller in New England: and I was the more forcibly struck with this, when I looked from the corridor of the hacienda over the whole expanse of country, and saw it dotted here and there with villages and haciendas, the white towers of whose chapels rose up beautifully from an unbroken mass of verdure.

"We were received at this plantation by the administrador, or steward, who had been expecting us for an hour or more; and though he had already partaken of his dinner (believing that we did not intend visiting St. Nicolas to-day), he immediately ordered another, in the meantime showing us to a large and cool apartment, containing a number of beds, where we made a hasty toilet.

"We took a *siesta* after dinner, and then walked with Don A. over the estate. The whole of the fields are planted with cane for a great distance around the house, which forms, by itself, a very extensive establishment.

"First there is the dwelling, a large two-story edifice, having in the basement all the offices, and the store where every necessary is sold to the Indians; above this are the kitchens, parlours, bedrooms, and an immense corridor on arches, looking toward the east, filled with caged birds, and hung with hammocks, where the family pass most of the long warm days of summer. In front is the *corral*, on the west of which are the store-houses and buildings to receive the crop; while on the east is another huge edifice,

where the boilers, engines, crushing machines, cooling vats, moulding apartments, &c., constitute the *trapiche* of the hacienda. It is a little city in itself.

"At sunset all the Indians employed on the premises assembled under the corridor on the basement floor, to account to the administrador for their day's labour and their presence. As he called their names each one replied with '*Alabo á Dios*,'—'I praise God,' and ranged himself against the wall in a line with those who had already responded. When the whole list had been examined, they were dismissed, and departed in a body singing an Indian hymn to the Virgin, the sounds of which died away in the distance as they plodded home over the level fields to their village.

"At night we heard the sound of a clarionet, bass-drum, and flute, at some distance from the dwelling, and on inquiry, discovered that a band of musicians had been organised in an adjoining village by the owner of the hacienda. We strolled over. The whole of a large hut had been appropriated for a musical hall, where the performers were just assembling; while others, who had already arrived, were engaged in tuning their instruments. The leader was quite a respectable-looking Indian, decently dressed, who played the violin; the clarionet player was fortunate in the possession of cotton drawers and a shirt; the bassoon had a pair of drawers but no shirt; the serpent was the wildest looking Indian I ever saw, with long dishevelled black hair, and eyes worthy of his instrument; the big drum was a huge portly old negro, who reminded me of many of our performers on it at home; while the octave flute was an urchin of not more than twelve, the wickedest little devil imaginable, but a fellow of infinite talent, and a capital performer.

"The night was rather too hot to permit us to remain long in the apartment with an Indian crowd; we therefore took our seats outside, where we were favoured by the self-taught amateurs with several airs from recent operas, performed in a style that would not have injured the reputation of many a military band at home (the United States).

"It may reasonably be argued, from a scene like this, that the Indians have talents for one of the arts requiring a high degree of natural delicacy and refinement. If it had been the care of all Spanish proprietors gradually to bring forth their latent dispositions as the Senores J. have done, Mexico would now present a picture very different from that of the degradation which fills its valleys with a slothful, ignorant, and debased multitude.

"About two weeks since, seven armed and mounted ruffians attacked two Frenchmen and their servants near the hacienda of Trenta. One of the Frenchmen was severely wounded, but the other, aided by the two *mosos*, succeeded in beating off the robbers, who left one of their number dead on the field, and his horse and trappings as spoils for the victor.

CUAUTLA DE AMILPAS AND HACIENDA DE ST. INEZ.—"We left the hospitable hacienda of San Nicolas at four o'clock this morning (24th September), and passed through a great number of Indian villages, and some haciendas of considerable extent, especially that of *Trenta*, which derives its name from the fact that it was originally purchased for the sum of thirty dollars. With its village, its church (nearly a cathedral in size), its immense sugar works and princely domain, I suppose it could not be acquired now for much less than half a million.

"After enjoying a fine view of the volcano of Popocatepetl at sunrise, and passing the village of Tlaltisappan, we struck into the mountain gorges which we had been for some time approaching. The ground gradually rose, the glens and defiles became more numerous, and among the wild and tangled forests of these solitary mountains we passed many ill-looking wretches, armed and mounted, but always in too small a number to attack our party. There is no doubt they were robbers, as several had their faces partly disguised, while their weapons were cocked and resting in their hands as they passed us. We cocked ours, also, and thus moved on fairly quits with the vagabonds.

"On the sides of these mountains, there were continuous groves of that tall pillar-like species of the *cactus* which is called '*organos*.'

"The heat became insufferable towards noon, and I felt, for the first time, weary of our journey among the lonely hills and defiles. Our impatience to reach Cuautla was increased by the accounts of the Indians we encountered on the road, who invariably added a league or half a league to the distance as we advanced. At length, however, after passing through a very extensive Indian corn-field, which I computed to contain at least five hundred acres, we reached the valley of Amilpas, and, in half an hour more, entered an Indian village bowered in the foliage of bananas and palms, through the midst of which ran a cool and sparkling streamlet. Here we halted to refresh ourselves, as the sun was blistering our skins, and we burned with a fever that was scarcely mitigated by profuse perspiration. After leaving this village, Cuautla appeared immediately on our left, with a rapid river running by it; while, in front, was the stately hacienda of Cuauwistla, belonging to the Dominican monks of Mexico, from the revenues of which a liberal sum is annually set apart for the entertainment of travellers.

CUAUTLA is a perfect southern city. The houses are small and airy; clear water gurgles through the middle of the street; broad-leaved trees fling their branches over the low dwellings. The women loll, half-dressed, in the windows and doors, gazing at nothing or each other; the men seem to have as little to do as the women, and the whole has an air of the '*dolce far niente*,' which prevails in this mild and tempting climate.

"Passing through the square, we entered a by-street and arrived at the door of the *meson* (tavern).

"I remembered immediately my experience at Perote, and the account given by Latrobe of *his* experience at this very inn.

"The gate of the court-yard was thrown open for us. In front lay a narrow lane, on one side of which was a shed, and beneath it a couple of sheep munching a stack of green corn in a corner, while a couple of turkeys picked up what they could find. On the roof a lot of sheepskins, recently taken from the animal, were spread out to dry in the sun. At the end of the lane was the kitchen of the *meson*, which seemed also to be the cobbler's stall of the burly landlord; who, tucking up his apron in front, ran out to salute us before we dismounted, followed by his stout wife and a greasy scullion, as fat, dirty, and disgusting as *Maritornes*.

"We inquired if he could '*accommodate us*.'

"'*Si senores, si senores!*' said he, with a strong emphasis on the *si*, as if surprised at our even doubting for an instant the capabilities of his establishment.

"It will be remembered that we now numbered twelve in the party. We asked him (still without dismounting) to show us the rooms.

"From the end of the lane I have described, another struck off at right-angles with it, and both of its sides were adorned with a row of one-story windowless cabins, over the doors of which appeared, in true hotel fashion, the numbers 1.—2.—3.—4.—5.—6.

"G—— got down to examine, and the landlord led the way. He first opened No. 3. It was eight feet long, about six wide, and ten high; in one corner lay a pool of mud on the earthen floor, and the walls were literally black with fleas. G—— at once objected to this, and the landlord said that it was of course not intended for the *senores*, but for the baggage and the *mosos*. He had '*another, more comfortable*' for ourselves; and stepping across the street opened No. 6, which, from its exterior, appeared to be of the same size as No. 3. Scarcely had he turned the bolt—when out walked a full grown ass!

"But our discontent did not satisfy the landlord—he did not see why we could not be '*accommodated*' in rooms that were good enough for other folks—and we might praise the Virgin if we got better in Cuautla!"

"There was no time for discussion, however, and as we were hungry, and would rather betake ourselves to the fields and sleep under the trees than submit to the vermin of Cuautla, I proposed that we should return to Cuauwistla. In the meantime, however, Don Juan Black had bethought him of all his friends in the village, and discovered that

the administrador of Santa Inez was an old acquaintance who had often requested a visit in his journeys to the *tierra caliente*.

"The hacienda of Santa Inez is situated in the midst of sugar-fields to the north of the town, and the works, residence, chapel, and Indian village, are bordered by a beautiful stream among some of the finest forest trees I have seen in the republic. I shall never forget the kind reception of Don Filipe Vargas;—it was that of a tried old friend. Ample accommodation and beds were offered us; a meal (which, in apologising for, he called a 'penetencia,') was quickly spread on snowy damask, served with a fine display of silver and excellent claret; and the whole was seasoned with a welcome that will mark Don Filipe in my memory as a man to be trusted in times of difficulty.

"On Saturday evening, after a walk in the charming groves that border the brook and Indian village, from which there was a noble prospect of the whole of Popocatepetl, with the sunset tinging its snows, we returned to the hacienda and took seats in the lower court, near the office where the clerk of the administrador was paying off the hands for their week's work. Here chocolate was handed us, served in the same tasteful style as our dinner.

DEGRADED STATE OF THE ABORIGINES.—"The hands were all mustered, and came up with the usual 'Alabo a Dios!' to receive their weekly wages, as on last evening at San Nicolas.

"Don Filipe informs me that all the ordinary expenses of this estate are 500 dollars per week; but during the working season they rise frequently to 1200 dollars. Three hundred labourers are usually employed at two and a half to three *reals* a day, and the total production of the hacienda is about 40,000 loaves annually—the loaves averaging twenty-three pounds—or, in all, 920,000 pounds of refined sugar. Here, as elsewhere, the molasses nearly pays the expenses.

"He complains greatly of the worthlessness of the Indians, and expresses hopes of improvement from the establishment of schools in Cuautla, where the young children learn rapidly, if they are allowed by their intemperate and gambling parents to continue in their classes. He alleges that the greatest punishment for the Indians is to discharge and expel them entirely from the estate upon which they and their ancestors from time immemorial, have worked; but he intimates that other punishments are resorted to for trifling faults and excesses, and I doubt not the whip is made to play an important part in the discipline of Mexican plantations.

"Mr. Stephens, in his last work on Yucatan, describes a scene of this sort which he witnessed.

"'Looking into the corridor,' he says, 'we saw the poor Indian on his knees on the pavement, with his arms clasped around the knees of another Indian, so as to present his back fairly to the lash. At every blow he rose on one knee, and sent forth a piercing cry. He seemed struggling to retain it, but it burst forth in spite of all his efforts. His whole bearing showed the subdued character of the present Indians, and with the last stripe the expression of his face seemed that of thankfulness for not getting more. Without uttering a word, he crept to the major-domo, took his hand, kissed it, and walked away. No sense of degradation crossed his mind. Indeed, so humbled is this once fierce people, that they have a proverb of their own: 'Los Indios no oigan sino por las nalgas'—the Indians only hear through their backs.'

ANOTHER ARGUMENT IN FAVOUR OF SLAVERY.—"In what then is this Indian population, throughout the planting, farming, and mining districts, equal to our slaves? Although not hereditary property by LAW, they are hereditary by custom, and the force of those circumstances which deny them the opportunity of bettering their condition, either by emigration to foreign countries, or by diffusing themselves over their own. They form a degraded caste. They are subjected to the control of masters and overseers, and although it is true that they are regularly paid for their labour and habitual degradation, yet they are ignorant, gambling, intemperate, and liable at any moment to be submitted to the lash, against which they have not the courage to offer the slightest resistance. With all the boast, therefore, of the authorities of Mexico, that no man is held in bond-

age within its limits, I still think that no candid person can inspect the condition of these labourers *without giving the palm to our negroes*, and exclaiming indignantly at *the masked slavery which is carried on from year to year, without the slightest prospect of ameliorating the character or condition of the miserable natives.*

“If a man become *slave by descent*, under the *well-established laws (!!!)* of a nation by which the institution is recognised, he has always a master, whose duty it is to afford him food, raiment, and protection, in recompense for his toil; and although moralists may say that slavery is in its very nature deteriorating, yet it does not crush the very spirit from the negro, or tend always to his debasement. He is sober; he cares for his family; he feels the duties of the social relations, even in his ‘quarter;’ and is ambitious of the degree of respectability he may acquire among his fellow slaves. His condition must, therefore, both physically and intellectually, be superior to that of the Indian who becomes a slave, in spite of the law, by the servility of his character and the loathsome vices that absorb his earnings, without a care for the comfort of his family, the education of his children, or even the personal appearance he presents among his fellows (!!!)

“When we remember the degree of civilisation that had been attained by these races anterior to the Mexican conquest, it is impossible to believe that their present debasement is to be alone attributed to an enervating climate; nor can Mexico ever claim a high standing among nations until she blots this stain of hypocritical freedom from the fairest portions of her territory. With the improvement of the lot and character of her Indians (who number near four millions of the seven that compose her whole population,) the steady advancement of the nation will proceed; but until that occurs, her fondest admirers can have but little hope, either for her progress or even for her continuance as a nation.

CUAUTLA.—“The next morning (Sunday, September 25) we arose early and went to the town of Cuautla, passing great numbers of Indians with *half-shaved heads* on their way to the Sunday market, where they usually assemble in the Plaza to purchase and sell their commodities. As we reached the town, the bells were ringing for mass, and we strolled into several of the churches. One of them was being repaired, and the altars were filled with skulls and bones that had been taken up while the floor was undergoing the requisite renovation. In the *parroquia*, or parish church, the stench from the dead bodies beneath the rough boards over which we trod, was so abominable that I hastened out of it, without examining some figures of Saints and Apostles done up in dresses that resembled very much the antique uniforms of the eighteenth century. Such anachronisms, however, are of frequent occurrence, and I have before alluded to them, in the instance where even our Saviour was represented in one of the most splendid churches of Mexico in a blue velvet robe and a *Guyaquil sombrero*!

“In the square, there were hundreds of Indians under cane booths, on mats spread with fruits, skins, rebosos, serapes, ices, orgeats, lemonade, vegetables, flowers, and all the varied products of the *tierra caliente*. I stepped into one and breakfasted on oranges, sponge cake, and iced milk. The stores around the square were all open, and indeed I saw no cessation of the usual week-day occupations, except among the Indians who thronged the Plaza. The women, as on yesterday, lolled in the broad window-sills! the men lolled opposite them, or leaned against the walls in the shade—and the excessive heat seemed to have predisposed every one, before ten o’clock, to a doze or a siesta.

“In one of the stores (while Don Juan was bargaining for a horse) the owner showed me a *centipede* of the *tierra caliente*, a horrible reptile of the scorpion kind, with which he says the old houses of Cuautla are infested. These and the *alacranes* (a sort of cross of the spider on the scorpion), are the scourges of the warm country, and the bite of both frequently results in the extreme illness of adults, and the death of children.

“A wide plain skirts the foot of the sierra that hems in the Valley of Mexico, and runs from the valley of Cuautla into that of Puebla. Over it lay our road this afternoon (towards the city of Mexico) and after passing one of those strange and deep barrancas, down which plunged a cascade of clear water for some two hundred feet, we com-

menced the ascent of the range of mountains forming the last barrier between us and the capital.

"Scarcely had we mounted the hills when it began to rain, for the first time during the day since we left Cuernavaca, and I experienced immediately a remarkable change in the temperature, from the scorching heat in the square of Cuautla. Our serapes were at once put on, and we wore them for the rest of the evening.

"Santa Inez is on the limit of the *tierra caliente*;—at five or six miles distance the culture of the sugar cane ceases, and the *tierra templada* commences.

"We passed the beautiful Indian village of Acaclauca, with its green leaves, chapels, and churches, in front of one of which I saw the last tall group of palm-trees standing out with their feathery branches relieved against the snow of Popocapetl. It was a strange picture, mingling in one frame the tropic and the pole.

"Near eight o'clock the distant barking of dogs announced our approach to the village where we designed resting until morning. Small fires were lighted before each door, and by their light we meandered through half-a-dozen crooked and hilly streets before we reached the house of the worthy Don Juan Gonzales (an old friend of the consul), who at a moment's notice received us under his hospitable roof.

"Don Juan is a man 'well to do' in the world of his little village;—he keeps a store, rents a room to a club of village folks, who like a drop of aguardiente or a quiet game of *monte*; and, above all, has the loveliest girl in the *tierra templada* for a daughter.

"Don Juan ushered us ceremoniously into his long, low, back parlour. In one corner stood a picture of the Virgin with a lamp burning before it, while opposite was a table, around which were gathered five of the neighbours in shirt-sleeves, slouched hats, and beards of a week's growth, busy with a game of greasy cards, in the light of a dim 'tallow.' Ever and anon, the little sylph of a daughter brought in the liquor for the boors. It was Titania and Bottom—Ariel and the Clown;—and I longed for the pencil of Caravaggio to sketch the gamblers, or of Retzsch to embody the whole spirit of the scene.

"After a frugal supper of tortillias and chocolate, we retired to feather-beds and clean sheets on the floor—but I was glad when we were called to horse at three in the morning. It had been a night of sore encounter; an army of fleas attacked us, the moment we retired, with a vigour and earnestness that did justice both to their appetite and our blood.

AYOTLA.—"We were off at half-past three (26th of September), by the moonlight of a cold and frosty morning, and, at the first streak of day found that we were winding high up the spur of hills that juts out from the sides of Popocapetl, which was in full view, with the clouds rolling off from its lofty head as the sun rose.

"Behind us, for near twenty leagues, the *tierra caliente* extended distinctly until the view was bounded by a bold and craggy sierra. We wound upward through the hill-farms, hanging against the sides of the mountains, and among the pine-forests, through whose branches a cold autumn wind was whistling. The road was *lined with crosses*, many of them recently erected, and hung with garlands and flowers; it is a dangerous pass, and infested by hordes of robbers, who attack the travellers either passing from Cuautla to the Valley of Mexico, or returning with the proceeds of their sales.

"Beyond the village of Hoochietipac, we lost sight both of the plain of Cuautla and the *tierra caliente*, and soon afterward the Valley of Mexico appeared to the west.

AT TENANGO, "we stopped for breakfast. Our inn was a small rat-hole of a *meson* for muleteers, with a corral of a couple of acres; but the whole establishment bore the sounding name of the '*Purissima Sangre de Cristo*!'

"We found, to our sorrow, that we were no longer in the land of rich haciendas and hospitable administrators. The old song of 'no hai!' had recommenced. Tortillias, chilé, mollé, pan, pulqué, agua?—'no hai.' With a little coaxing, however, we got one of the women of the house to seek out the remnant of Indian corn from their breakfast, which was soon ground into tortillias. As we were beginning to devour them, Don Juan espied an Indian bearing a couple of earthen jugs of milk, with one of which, and our leathery cakes, we managed to stay our stomachs till dinner. We again mounted, and descending by a series of inclined planes, speedily reached the level of the plain of Mexico.

This valley is exceedingly different from the *tierra caliente*. Although the temperature is milder, yet every thing is dry, parched, withered, and volcanic. The hill-sides and mountains are stripped of their forests; the fields are arid; the grain small and unproductive; and the whole has a waste and moor-like appearance. The Indians seem even dirtier, if possible, than those we have left behind us, and the patient mules travel over the long and dreary sands as if in a new Arabia.

"Passing through several mud-walled villages, we came at length upon the Vera Cruz road, and reached the town of Ayotla, seven leagues from Mexico.

"I would recommend every one who is about to travel through the *tierra caliente*, to procure a hammock of Sisal grass. With this, he is entirely his own master; and surely no mode of sleeping is more luxurious in a hot climate. You swing it from the rafters of the room—it is above the floor, clear of the walls, and free from insects—it bends to each motion of the body, fitting neatly to every part of your frame—you set it in motion, and while it swings you to sleep, it fans and refreshes by its gentle waving through the air.

"Besides the beautiful scenery through which I have passed during this journey, nothing has impressed me so favourably as the unaffected hospitality we met with everywhere, whether we came introduced or not. The old phrase, 'Mi casa, señor, está muy á su disposicion:' 'My house is entirely at your service,' was not a phrase of course—a mere formula to be gone through and forgotten. Their houses, their animals, their servants, and themselves, were all at our command, and with a cordiality that forbade the idea of *arrière pensée*.

"Living in the country, at a distance from large towns, with but little literature, and few and irregularly-received newspapers, the hacendados and their administradors are glad to welcome the traveller as a guest to their doors. With ample means of accommodation and entertainment, they enjoy as well as confer a favour, and are as thankful for your visit, as you are to them for their repasts and attentions. You feel that the account is fairly balanced, that the other little elegancies and assiduities which are thrown in for your comfort are the result of *genuine hospitality*, and the promptings of excellent hearts."

The descriptions of Mexico by Mr. Mayer, though in some respects contradictory, are by far the most favourable; but his excursions were very limited; and generally we would consider that Mr. Chevalier, an acute observer, who visited the country in 1835, is far more conclusive. "I have only been two months in Mexico, and already I have witnessed five attempts at revolution. Insurrections have become quite ordinary occurrences here, and their settled forms have been gradually established, from which it is not considered fair to deviate. These seem almost as positively fixed as the laws of backgammon, or the recipes of domestic cookery. The first act of a revolution is called *pronunciamiento*. An officer of any rank, from a general down to a lieutenant, pronounces himself against the established order, or against an institution which displeases him, or against any thing else. He gets together a detachment, a company, or a regiment, as the case may be, and these generally, without more ado, place themselves at his disposal. The second act is called the *Gecto*, or outcry, when two or three articles are drawn up, to state the motives or objects of the insurrection. If the matter is of some importance, the *Outcry* is called a *plan*. At the third act, the insurgents and the partisans of government are opposed to one another, and mutually examine each other's forces. At the fourth act, they come to blows; but, according to the improved system lately introduced, the fighting is carried on in a very distant, moderate, and respectful manner.

However, one party is declared victor, and the beaten party *dispronounce*. The conquerors march to Mexico, and their triumphal entry into the capital constitutes the fifth act of the play ; the vanquished meanwhile embark at Vera Cruz, or Tampico, with all the *horrors* of war.

“ With tranquillity, unfortunately, every thing else is also lost. There is no longer any security. It is mere chance, if the diligence from Mexico to Vera Cruz proceed the whole way without being stopped and robbed. It requires whole regiments to convey the *conducta* of piastres to Vera Cruz. Travellers who cannot afford to pay for an escort, go armed from head to foot, and in little caravans. Here and there, rude crosses erected by the side of the road, and surrounded by heaps of stones, thrown by passers-by, in token of compassion, point out the spot where some wayfarer, and almost always a stranger, has perished by the hands of robbers. The immediate environs of the most populous cities are infested by malefactors, and even in the interior of cities not excepting the capital, there is no longer any security. There are numerous instances of people being robbed on a Sunday, and at the hour even when the greatest number of people are abroad, within a league of Mexico. An English *chargé-d'affaires* was lassoed on the Alameda, the public walk, in the middle of the day. In the evening, after sunset, notwithstanding the numerous guardians of the night (*serenos*), notwithstanding the *videttes* of cavalry at every corner of the streets, notwithstanding the law prohibits the riding on horseback through the streets after eight o'clock, in order to prevent the use of the lasso, a man is not safe in Mexico, not even in his own house. If, in the evening at eight or nine o'clock, you visit a friend, before the porter consents to open the enormous gate, lined with iron or bronze, there pass as many formalities as if it were a question of letting down the drawbridge of a fortress. Persons, on whose words I think I can rely, have assured me, that as many as 900 dead bodies are yearly deposited in the Morgue of Mexico.”

CHAPTER XI

CHARACTERISTICS OF THE INHABITANTS OF MEXICO.

THE Spanish Mexicans are accused of great indolence of character, occasioned by the abundant means of subsistence acquired by little industry. They are, from idleness, addicted to gambling, which is charged against them as a prevailing vice. Probably no two men differ from each other so widely in habits and character as the Anglo-Saxon Americans and the Spanish Americans.

Mr. Mayer says,—“ The Mexicans are a proud and *sensitive* people ; yet, none are more easily subdued by kindness—none more easily won by a ready disposition to mingle in their ranks, and treat them with a due respect for their *habitudes* and their prejudices.

"It seems impossible for them to get rid of the idea, that European powers are seeking to obtain their wealth and territory, and to re-establish the systems from which they freed themselves by so many years of revolutionary war; nor can they (since the Texan war) divest themselves of the erroneous notion, that the United States has ever a longing eye on their capital and country.

"There are but few entertainments given in Mexico, in comparison with those of other cities abroad, where a lavish expenditure in viands, lights, and amusements for the few hours of a single evening, are mistaken for the elegancies and refinements of genuine hospitality;—instead, however, of these ostentatious displays, there are frequent reunions at *turtulias*, where an hour or two are most agreeably spent.

"I have already alluded to the extreme of fashionable life, and its disposition for the theatre; and I do not intend to treat again of the propensity of the *ultras* to living thus constantly in the public eye, without devoting a portion of each day to that domestic intercourse and reunion which make the comfort and beauty of an English or American fireside. I speak, however, of that *juste milieu* of society, wherein resides the virtue and intellect of a country.

"It was my good fortune to reside for more than half a year in a native family, once rich and titled, but broken in fortunes by the political and commercial vicissitudes of the republic, and it was there that I constantly witnessed the most beautiful evidences of a filial devotion and parental love, amounting almost to passionate attachment. The lady at the head of the establishment, was a person who had been distinguished for her talents and accomplishments in the days when Mexico was adorned with the splendour of a Spanish court. She would have been considered highly cultivated in any country; her manners were excellent; her bearing graceful and courteous; and a wide circulation in her youth among distinguished men (both before and during the revolution), and a ready talent for imparting her recollections, made her conversation delightful and instructive. Besides this, she possessed a genius for miniature-painting and sketching in crayons, rarely attained by a female, and worthy of a distinguished artist. Qualities like these, brought around her constantly a large and intelligent circle of both sexes. The change of fortune had by no means diminished her estimation in society, and the numbers of fast friends who adhered to her in her comparative indigence, proved their admiration of talent, and the constancy of attachment, by the repetition of the most delicate and disinterested assiduities.

"It was in this Mexican *home*, and not from the unsympathising distance of the hotel and ball-room (the scene of most travellers' observation), that I obtained my insight into the structure of Mexican society and character. Had I kept myself aloof in my own house or my own inn, as is the habit of foreigners, I should have judged from the theatre, the *passéo*, the bull-ring, the cock-pit, and the gaming-table; that the women were but so many painted dolls, without more education or soul than was required to languish over a love-sick play, or to ogle, with idle gaze, a favoured cavalier. I might have supposed, too, that the men were supremely blessed by this dalliance with the sex, and considered themselves in perfect elysium when they could divide their attention between their sirens, their horses, and the card-table;—but in the privacy of this dwelling, I learned to estimate the love and regard between parents and children; the beautiful benevolence of ancient friendship; the universal respect for genius; and, besides, had frequent occasion to notice the expanding spirit, ardent patriotism, desire of cultivation, and quick talent, which embellish the Mexican character.

"It must not be said that I am estimating a country by one example;—I am as far from so partial a judgment, as the opponents of Mexico are from a just one on their side of the question. It is true, that this family afforded me an extensive field of observation, but it chiefly served to stimulate my attention and inquiries elsewhere; and I can frankly declare, that wherever I observed, I invariably found the same qualities of head and heart. It is this *heart* that is in fact the great characteristic of Mexicans, and especially of their females. There is a noble naturalness, an antique generosity about them, which is the parent of a multitude of virtues, and it is by an abandonment of themselves to *impulses*, that so much irregularity and indiscretion have been frequently manifested, both in politics and society.

"I have said that the Mexicans are a people of quick talent, and my remark is borne out by the observation of all foreigners. They are quick to apprehend, quick of study, and quick in mastering a subject; but this very facility, joined with their impulsiveness, is often fatal to their enduring application and progress.

"I came among these people an entire stranger, without especial claims on their attention, and studious to avoid that bill of exchange hospitality, which is the result of introductory letters from former, and, perhaps, forgotten acquaintances. Yet mingling freely among all classes, and comparing them now—when gratitude for acts of kindness has been long yielded and the annoyance of petty impertinences forgotten—I have none but kindly recollections of the people, and none but favourable impressions of the mass of a society, in which I had been taught to believe that I should be held in utter antipathy as an heretical stranger.

"There are in Mexico as in all other countries, specimens of egotism, selfishness, haughtiness, ill-breeding, and loose morals, both among the men and the women; but, although we find these floating like bubbles on the *top* of society, they must not therefore be considered the characteristics of the country. A nation in which 'revolutions and counter-revolutions are events of almost daily occurrence, is naturally prolific in desperate and crafty political adventurers,' and dissimulation and stratagem may, in time, form the chief element of the character of such a people;—yet such, it is hoped, is not to be the corrupting fate of Mexico.

"The idea that large social entertainments require great magnificence and lavish expense, deprives the Mexicans, in their towns, of many of those agreeable gatherings which fill up so pleasantly our winter nights and autumn evenings; but it is *on their haciendas or plantations that their hospitality is most distinguished*. Nothing is withheld from you; their establishments are placed at your entire control, and the welcome is as sincere as it is hearty and cheerful.

"That they are brave none will doubt, who read the history of their War of Independence, although the bad discipline (especially of their officers) has prevented the very eminent exhibition of this quality in their foreign battles. In fact, regard them in any way, and they will be found to possess the elements of a fine people who want but peace and the stimulus of foreign emulation, to bring them forward among the nations of the earth with great distinction.

"Their geographical position, however, is very unfavourable for this emulative stimulus. They are placed among the mountains, on an isthmus connecting two large continents, while their territory is washed by two seas. They are cut off by a large belt of savage country from us at the north, and the communication with Europe is both distant and uncertain. They have a small population, spread over an immense territory, and want, therefore, both the constant comparison of the intellect of other nations, and social compacting or aggregation among themselves. I can (from personal experience) state how disagreeable is this want of intercourse with the rest of the world. There is intelligence from the United States, perhaps, once a month, and about as often from Europe. The information brought by these arrivals, passes chiefly into the hands of the merchants—and, after a while, is gradually translated in fragments for some of the meagre newspapers, which treat you, months afterward, to a *refacciamento* of the stories or improvements that you had already forgotten. In this respect, our community of language with Great Britain is of vast importance to us. England acts the part of an editor for the United States. She collects the news, the literature, the progressive inventions, and the genius of the old world, with unparalleled activity;—and we are always, at furthest, but twelve days behind her in diffusing these results among the seventeen millions of our own people. But it may be feared, that it will be long before Mexico imitates our example. Spain is not an England in intellectual energy or advancement; and the day has not yet arrived in Mexico when a work in two volumes can be printed, bound, and distributed to her chief cities within twenty-four hours after its reception from Europe.

"I am afraid the tendency of our sister republic is too much toward the opposite extreme. She has not disenthralled herself from the Spanish bigotry which inculcated the idea that a nation must do all for herself, without a commercial marine of her own

to carry on a well-regulated commerce. This seems as likely to make boors of the people who practise it, as seclusion is calculated to make ascetics of those who refuse to mingle with the world, and improve their spirits by a free interchange of opinions and feelings.

CRIME.—“Passing westward, toward the Paseo Nuevo from the Alameda, you cross the square in front of the *Accordada*, the common prison of the capital. In the front of one of its wings a low-barred window is constantly open, and within, on an inclined plane, are laid the dead bodies found daily within the limits of the city. It is almost impossible to take your morning walk to the adjoining fields, without seeing one, and frequently two corpses, stretched bleeding on the stones. These are the victims of some sudden quarrel, or unknown murder during the night; and all who miss a friend, a parent, or a brother, resort to these iron bars to seek the lost one. It is painful to behold the scenes to which this melancholy assemblage frequently give rise, and hear the wails of sorrow that break from the homeless orphan, whose parent lies murdered on the stones of the dead-house.

“Yet this is scarcely more shocking than the scenes presented by the *living*, within the walls of the loathsome prison. A strong guard of military is stationed at the gate, and you enter, after due permission from the commanding officer. A gloomy stair leads to the second story, the entrance to which is guarded by a portal massive enough to resist the assault of a powerful force. Within, a lofty apartment is filled with the officers of the prison and a crowd of subalterns, engaged in writing, talking, and walking—amid the hum of the crowd, the clank of chains, the shouts of prisoners, and the eternal din of an ill-regulated establishment.

“Passing through several iron and wood-barred gates, you enter a lofty corridor, running around a quadrangular court-yard, in the centre of which, beneath, is a fountain of troubled water. The whole of this area is filled with human beings—the great congress of Mexican crime—mixed and mingling, like a hill of busy ants swarming from their sandy caverns. Some are stripped and bathing in the fountain; some are fighting in a corner; some making baskets in another. In one place, a crowd is gathered around a witty story-teller, relating the adventures of his rascally life. In another, a group is engaged in weaving with a hand-loom. Robbers, murderers, thieves, ravishers, felons of every description, and vagabonds of every aspect, are crammed within this court-yard; and, almost free from discipline or moral restraint, form, perhaps, the most splendid school of misdemeanour and villany on the American continent.

“Below, within the corridor of the second story—from which I have described the view of this wretched mass of humanity—a rather better sort of criminals are kept; and yet, even here, many were pointed out to me as being under sentence of death, who still went about entirely without restraint.

“In one corner of the quadrangle is the *chapel*, where convicts for capital offences are condemned to solitude and penance, during the three last days of their miserable life; and, at a certain hour, it is usual for all the prisoners to gather in front of the door, and chant a hymn for the victim of the laws. It is a solemn service of crime for crime.

“I did not see the prison for women, but I am told it is much the same as the one I have just described. About 100 of the men, chained in pairs like galley-slaves, are driven daily into the streets, under a strong guard, as scavengers; and it seems to be the chief idea of the utility of prisons in Mexico, to support this class of coerced labourers.

“There can be no apology, at this period of general enlightenment in the world for such disgraceful exhibitions of the congregated vice of a country. Punishment, or rather incarceration, and labour on the streets, in the manner I have described, is, in fact, no sacrifice; both because public exhibition deadens the felon’s shame, and because it cannot become an actual *punishment* under any circumstances of a *lépero’s* life. Indeed, what object in existence can the *lépero* propose to himself? His day is one of precarious labour and income; he thieves; he has no regular home, or if he has, it is some miserable hovel of earth and mud, where his wife and children crawl about with scarce the instinct of beavers. His food and clothing are scant and miserable. He is without education, or prospect of improvement. He belongs to a class that does not *rise*. He dulls his sense of present misery by intoxicating drinks. His quick temper stimulates him to quarrel.

His sleep is heavy and unrefreshing, and he only rises to a day of similar uncertainty and wickedness. What, then, is the value of life to him, or to one like him? Why toil? Why not *steal*! What shame has he? *Is the prison, with certainty of food—more punishment than the free air, with uncertainty?* On the contrary, it is a *lighter* punishment; and as for the degradation, he knows not how to estimate it.

"Mexico will thus continue to be infested with felons, as long as its prison is a house of refuge, and a comparatively happy home to so large a portion of its outcast population.*

"I have collected some statistical information on these subjects, which I think will be interesting in connexion with Mexican prisons, and prove how necessary it is, in the first place, to alter their whole system of coercive discipline; and, in the second, to strike immediately at the root of the evil, by improving the condition of the people—by educating, and proposing advantages to them, in the cultivation of the extensive tracts of country that now lie barren over their immense territory.

IMPRISONMENTS in Mexico for 1842.

NUMBER OF PRISONERS.	Men.	Women.
	number.	number.
During the first six months of 1842, there were imprisoned in the city of Mexico	3197	1427
During the second six months	2858	1379
Total of both sexes for 1842	6055	2806

"Without specifying *each* of the several crimes, for which these persons were committed to prison, or being able, from all the accounts furnished me, to state the exact number of those who were finally *convicted*, I will present some lists of the numbers imprisoned for the *chief* crimes, during the whole year.

CRIMES.	Men.	Women.	Total.
	number.	number.	number.

males and females, for the *higher* crimes and misdemeanors—leaving a balance of 1927 only, to be divided among the *lesser*. It should be stated, in addition to the above, that numbers were committed for *throwing vitrol* on the clothes and faces of persons passing along the street; that 113 dead bodies were found; 17 individuals *executed*, and 894 sent to the hospital.

"The sum of 4121 dollars is expended in salaries of officers for this institution, and 30,232 dollars for the support of the prisoners.

* "As an evidence of the little value these *léperos* place upon their lives,—an old resident in Mexico told me, that he had once been the witness of a street-fight between two women, which resulted in the use of knives, and the ripping of one's belly, so that her bowels were exposed. The wound was not fatal, and as soon as she had slightly recovered from the loss of blood, while the attendants were preparing a litter, she drew forth a *cigarrito* from her bosom, obtained a light from a bystander, and was borne off to the hospital, smoking as contentedly as if preparing for a *siesta*!"

CHAPTER XII.

CITY, AND DEPARTMENT, FORMERLY THE INTENDANCY, OF MEXICO.

THE population of the former intendancy of Mexico was, in 1803, stated to be 1,511,800 souls. In the department which comprises a lesser extent of territory, the population in 1842 was enumerated at 1,389,520.

The whole of the country which was included under the intendancy is situated under the torrid zone. It extended from the 16 deg. 34 min. to the 21 deg. 57 min. of north latitude. It was bounded on the north by the intendancy of San Luis Potosi, on the west by the intendancies of Guanajuato and Valladolid, and on the east by those of Vera Cruz and La Puebla de los Angeles. It is washed towards the south by the South Sea, or Pacific Ocean, from Acapulco to Zacatula. More than two-thirds of the area of this territory are mountainous.

The Valley of Mexico, or Tenochtitlan, of which M. Humboldt has published a very minute map, is situated in the centre of the *cordillera* of Anahuac, on the ridge of the *porphyritic* and *basaltic amygdaloid* mountains, which run from the south-south-east to the north-north-west. This valley is of an oval form.

Six great roads were made to cross the *cordillera* which encloses the valley, of which the medium height is 3000 metres (or 9842 feet) above the level of the ocean. 1. The road from Acapulco to Guchilaque and Cuervaracca by the high summit, called La Cruz del Marques (alluding to Hernan Cortez, Marques de Valle de Oaxaca). 2. The road of Toluca by Tianguillo and Lerma, a magnificent causeway, not sufficiently to be admired, constructed with great art, partly over arches. 3. The road of Queretaro, Guanajuato, and Durango [*el camino de tierra adentro*], which passes by Guautitlan, Huehuetoca, and the Puerto de Reyes, near Bata, through hills scarcely eighty metres (or 262 feet) above the pavement of the great square of Mexico. 4. The road of Pachuco, which leads to the celebrated mines of *real del Monte*, by the Cerro Ventoso, covered with oak, cypress, and rose-trees, almost continually in flower. 5. The old road of La Puebla, by San Bonaventura and the Llanos de Apan. And, 6. the road of La Puebla by Rio Frio and Tescmelucos, south-east from the Cerro del Telapon, of which the distance from the Sierra Nevada, as well as that from the Sierra Nevada (Iztaccihuatl) to the great volcano (Popocatepetl), served for bases to the trigonometrical operations of MM. Velasquez and Costanzo.—*Alcedo*.

From the capital of Mexico being described as a city built in the midst of a lake, and connected with the continent by dikes, Alcedo observes, "Those who look at Humboldt's map will be no doubt astonished on seeing that the centre

of the present city is 4500 metres (or 14,763 feet) distant from the Lake of Tezcuco, and more than 9000 metres, or 29,527 feet from the Lake of Chalco; but the city has certainly not changed its place, for the cathedral of Mexico occupies exactly the ground where the temple of Huitzilopochtli stood, and the present street of Tacuba is the old street of Tlacopan, through which Cortez made his famous retreat in the fatal night of the 1st of July, 1520, which still goes by the name of *noche triste*. The difference of situation between the old maps and those published by Humboldt, arises solely from the diminution of water in the lake of Tezcuco.

A letter addressed by Cortez to the Emperor Charles V., dated 30th of October, 1520, gives a description of the Valley of Mexico. "The province in which the residence of this great lord Moctezuma is situated," says Cortez, "is circularly surrounded with elevated mountains, and intersected with precipices. The plain contains near seventy leagues in circumference, and in this plain are two lakes, which fill nearly the whole valley; for the inhabitants sail in canoes for more than fifty leagues round." (He speaks only of two lakes, for he knew but imperfectly those of Zumpango and Xaltocan, between which he hastily passed in his flight from Mexico to Tlascala, before the battle of Otumba.) "Of the two great lakes of the Valley of Mexico, the one is fresh and the other salt-water. They are separated by a small range of mountain (the conical and insulated hills near Iztapalapan); these mountains rise in the middle of the plain, and the waters of the lake mingle together in a strait between the hills and the high *cordillera* (undoubtedly the east declivity of Cerros de Santa Fé). The numerous towns and villages constructed in both of the two lakes carry on their commerce by canoes, without touching the continent. The great city of Temixtitlan or Tenochtitlan is situated in the midst of the salt-water lake, which has its tides like the sea; and from the city to the continent there are two leagues, whichever way we wish to enter. Four dikes lead to the city: they are made by the hand of man, and are of the breadth of two lances. The city is as large as Seville or Cordova. The streets, I merely speak of the principal ones, are very narrow and very long; some are half-dry and half-occupied by navigable canals, furnished with very well-constructed wooden-bridges, broad enough for ten men on horse-back to pass at the same time. The market-place, twice as large as that of Seville, is surrounded with an immense portico, under which are exposed for sale all sorts of merchandise, eatables, ornaments made of gold, silver, lead, pewter, precious stones, bones, sheels, and feathers; delft-ware, leather, and spun-cotton. We find hewn stones, tiles, and timber fit for building. There are lanes for game, others for roots and garden-fruits; there are houses where barbers shave the head (with razors made of obsidian); and there are houses resembling our apothecary shops, where prepared medicines, unguents, and plasters are sold. There are houses where drink is sold. The market abounds with so many

things, that I am unable to name them all to your highness. To avoid confusion, every species of merchandise is sold in a separate lane; every thing is sold by the yard, but nothing has hitherto been seen to be weighed in the market. In the midst of the great square is a house, which I shall call *l'audiencia*, in which ten or twelve persons sit constantly for determining any disputes which may arise respecting the sale of goods. There are other persons who mix continually with the crowd, to see that a just price is asked. We have seen them break the false measures which they had seized from the merchants."

Such was the state of Tenochtitlan in 1520. Humboldt sought in vain in the archives of the family of Cortez, preserved at Mexico in the Casa del Estado, for the plan which he ordered to be drawn up of the environs of the capital, and which he sent to the emperor, as he says, in his third letter published by Cardinal Lorenzana. The Abbe Clavigero has ventured to give a plan of the Lake of Tezcucuo, such as he supposes it to have been in the sixteenth century. This sketch, though inaccurate, is thought preferable to that given by Robertson, and other European authors. Humboldt has drawn on the map of the Valley of Tenochtitlan the old extent of the salt-water lake, such as he conceived it from the historical account of Cortez, and some of his contemporaries. In 1520, and long after, the villages of Iztapalapan, Coyohuacan (improperly called Cuyacan), Tacubaja, and Tacuba, were quite near the banks of the Lake of Tezcucuo. Cortez says expressly, "That the most part of the houses of Coyohuacan, Culucan, Chulubuzco, Mexicaltzingo, Iztapalapan, Cuitaguaca, and Mizqueque, were built in the water on piles, so that frequently the canoes could enter by an under-door." The small hill of Chapultepec, on which the viceroy, Count Galvez, constructed a castle, was no longer an island in the Lake of Tezcucuo in the time of Cortez. On this side, the continent approached to within about 3000 metres (or 9842 feet) of the city of Tenochtitlan, consequently the distance of two leagues indicated by Cortez in his letter to Charles V. is not altogether accurate: he ought to have retrenched the one-half of this, excepting, however, the part of the west-side at the small porphyritical hill of Chapultepec. We may well believe, however, that this hill was, some centuries before, also a small island, like the Penol del Marques, or the Penol de los Banos. It appears extremely probable, from geological observations, that the lakes had been on the decrease long before the arrival of the Spaniards, and before the construction of the canal of Huehuetoca.—*Alcedo*.

The old city of Mexico communicated with the continent by the three great dikes of Tepejacac (Guadalupe), Tlacopan (Tacuba), and Iztapalapan. Cortez mentions four dikes, "because he reckoned, without doubt, the causeway which led to Chapultepec. The Calzada of Iztapalapan had a branch which united Coyohuacan to the small fort Xaloc, the same in which the Spaniards were entertained at their first entry by the Mexican nobility." Robertson speaks of a

dike which led to Tezcuco, but such a dike never existed, on account of the great distance, and the great depth of the east part of the lake.

The city of Tenochtitlan was divided into four quarters, called Teopan, or Xochimilca, Atzacualco, Moyotla, and Tlaguechiuchan, or Cuepopan. The old division was preserved in the limits assigned to the quarter of St. Paul, St. Sebastian, St. John, and St. Mary; and the present streets have for the most part the same direction as the old ones, nearly from north to south and from east to west, though more properly from the south 16 deg. west to north 74 deg. east, at least towards the convent of St. Augustin, where Humboldt took his azimuths. The direction of the old streets was undoubtedly determined by that of the principal dikes. Now, from the position of the places where these dikes appear to have terminated, it is improbable that they represented exactly meridians and parallels. But what gives the new city, as we have already observed, a peculiar and distinctive character, is that it is situated entirely on the continent, between the extremities of the two lakes of Tezcuco and Xochimilco, and that it only received, by means of canals, the fresh water of the Xochimilco.—*Alcedo*.

“Many circumstances have contributed to this order of things. The part of the salt-water lake between the south and west dikes was always the shallowest. Cortez complained that his flotilla, the brigantines which he constructed at Tezcuco, could not, notwithstanding the openings in the dikes, make the circuit of the besieged city. Sheets of water of small depth became insensibly marshes, which, when intersected with trenches or small defluous canals, were converted into *chinampas* and arable land.

“Of the five lakes of the Valley of Mexico, the Lake of Tezcuco is most impregnated with muriate and carbonate of soda. The nitrate of barytes proves that this water contains no sulphate in dissolution. The most pure and limpid water is that of the Lake of Xochimilco, the specific weight of which Humboldt found to be 1.0009, when that of water distilled at the temperature of 18 deg. centigrade, or 54 deg. Fahrenheit, was 1.000, and when water from the Lake of Tezcuco was 1.0215. The water of this last lake is heavier than that of the Baltic Sea, and not so heavy as that of the ocean, which, under different latitudes, has been found between 1.0269 and 1.0285. The quantity of sulphuretted hydrogen which is detached from the surface of all the Mexican lakes, and which the acetate of lead indicates in great abundance in the lakes of Tezcuco and Chalco, undoubtedly contributes in certain seasons to the unhealthiness of the air of the valley. Intermittent fevers, however, are very rare on the banks of these very lakes.”—*Alcedo*.

Humboldt says, “two sorts of hewn stone, the porous amygdaloid called *tezontli*, and especially a porphyry of vitreous feld-spa without any quartz, give to the Mexican buildings an air of solidity, and sometimes even magnificence. There are none of those wooden balconies and galleries to be seen

which disfigure so much all the European cities in both the Indies. The balustrades and gates are all of Biscay iron, ornamented with bronze, and the houses, instead of roofs, have terraces, like those in Italy and other southern countries.

“The edifice destined to the school of mines, for which the richest individuals of the country furnished a sum of more than 3,000,000 of francs, or 124,800*l.* sterling, would adorn the principal places of Paris or London. Two great palaces were recently constructed by Mexican artists, pupils of the academy of fine arts of the capital. One of these palaces, in the quarter Della Traspansa, exhibits in the interior of the court a very beautiful oval peristyle of coupled columns. The traveller justly admires a vast circumference paved with porphyry flags, and enclosed with an iron railing, richly ornamented with bronze, containing an equestrian statue of King Charles IV. placed on a pedestal of Mexican marble, in the midst of the *plaza mayor* of Mexico, opposite the cathedral and the viceroy’s palace. This colossal statue was executed at the expense of the Marquis de Branciforte, formerly viceroy of Mexico, brother-in-law of the Prince of Peace. It weighs 450 quintals, and was modelled, founded, and placed by the same artist, M. Tolsa, whose name deserves a distinguished place in the history of Spanish sculpture”—*Humboldt’s New Spain*.

Humboldt, who had seen successively, within a very short space of time, Lima, Mexico, Philadelphia, Washington, Paris, Rome, Naples, and the largest cities of Germany, remained nevertheless smitten with a recollection of the grandeur of this latter city, a circumstance which he attributes principally to the majestic character of its situation and the surrounding scenery.—*Alcedo*.

According to the same authority, “Large avenues of elms and poplars lead in every direction to the capital; and two aqueducts, constructed over arches of very great elevation, cross the plain, and exhibit an appearance equally agreeable and interesting. The magnificent convent of Nuestra Senora de Guadalupe appears joined to the mountains of Tepeyacac, among ravines which shelter a few date and young *yuca* trees. Towards the south the whole tract between San Angel, Tacabaya, and San Agustin de las Cuevas, appears an immense garden of orange, peach, apple, cherry, and other European fruit-trees.”

Alcedo, in the edition of 1817, observes, “The city of Mexico is also remarkable for its excellent police. The most part of the streets have very broad pavements; and they are clean and well lighted. These advantages are the fruits of the activity of the Count de Revillagigedo, who on his arrival found the capital *extremely dirty*.

“Water is everywhere to be had in the soil of Mexico, a very short way below the surface, but it is brackish, like the water of the Lake of Tezcuco. The two aqueducts already mentioned, by which the city receives fresh water, are monuments of modern construction worthy of the traveller’s attention. The springs of potable water are situated to the east of the town, one in the insulated hill of Chapultepec, and the other in the *cerros* of Santa Fé, near the

cordillera, which separates the Valley of Tenochtitlan from that of Lerma and Toluca. The arches of the aqueduct of Chapultepec occupy a length of more than 3300 metres, or 10,826 feet.

The enumeration in 1790, by orders of the Count de Revillagigedo, gave a result of only 112,926 inhabitants for the city; but this result was considered too low by Alcedo, who says, "The regular troops and militia in garrison in the capital are composed of from 5000 to 6000 men in arms. We may admit with great probability that the actual population consists of

2,500	white Europeans.
65,000	white Creoles.
33,000	indigenous (copper-coloured).
26,500	Mestizoes, mixture of whites and Indians.
10,000	Mulattoes.

137,000 inhabitants.

"There are consequently in Mexico 69,500 men of colour, and 67,500 whites: but a great number of the Mestizoes are almost as white as the Europeans and Spanish Creoles!

"In the twenty-three male convents which the capital contains there are nearly 1200 individuals, of whom 580 are priests and choristers. In the fifteen female convents there are 2100 individuals, of whom nearly 900 are professed *religieuses*.

"The clergy of the city of Mexico then was, and is now, extremely numerous, though less numerous by one-fourth than at that period at Madrid. The enumeration of 1790 gives

In the convents of monks.	{ 573 priests and choristers. 59 novices. 235 lay brothers.	} 867
In the convents of nuns.	{ 888 professed <i>religieuses</i> . 35 novices.	} 923
Prebendaries	.	26
Parish priests (<i>curés</i>)	.	16
Curates	.	43
Secular ecclesiastics	.	517
Total	.	2392

and without including lay-brothers and novices, 2068."

Alcedo, in comparing this capital with those of Europe in the beginning of the present century, says, "Mexico is the most populous city of the new continent. It contains only 40,000 inhabitants fewer than Madrid; and as it forms a great square, of which each side is nearly 2750 metres, or 9021 feet, its population is spread over a great extent of ground. Its greatest length is nearly 3900 metres (12,794 English feet); of Paris 8000 metres (26,246 English feet)."

The Count de Revillagigedo set on foot accurate researches into the consumption of Mexico. The following table was drawn up in 1791:—

CONSUMPTION of Mexico.

ARTICLES OF CONSUMPTION.	Quantity.	ARTICLES OF CONSUMPTION.	Quantity.
1. <i>Eatables</i> :—	number.	2. <i>Grain</i> :—	number.
Beeves.....	16,300	Maize, or Turkey wheat, cargass of	
Calves.....	450	three fanegas.....	117,224
Sheep.....	278,923	Barley, cargass.....	40,219
Hogs.....	50,676		
Kids and rabbits.....	24,000	3. <i>Liquid Measure</i> :—	
Fowls.....	1,255,340	Wheat flour, cargass of 12 arrobas.....	130,000
Ducks.....	125,000	Pulque, the fermented juice of the	
Turkeys.....	200,000	agava, cargass.....	294,790
Pigeons.....	65,300	Wine and vinegar, barrels of 4½	
Partridges.....	140,000	arrobas.....	4,507
		Brandy, barrels.....	12,000
		Spanish oil, arrobas of 25lbs.	5,385

“Supposing at that time, with M. Peuchet, the population of Paris to be four times greater than that of Mexico, we shall find that the consumption of beef is nearly proportional to the number of inhabitants of the two cities, but that that of mutton and pork is infinitely more at Mexico. The difference is as follows :

ANIMALS.	CONSUMPTION.		Quadruple of the Consumption of Mexico.
	Of Mexico.	Of Paris.	
	number.	number.	number.
Beeves.....	16,300	70,000	65,200
Sheep.....	273,000	350,000	1,116,000
Hogs.....	50,100	35,000	200,400

“M. Lavoisier found by his calculations that the inhabitants of Paris consumed annually, in his time, 90,000,000 lbs. of animal food of all sorts, which amounts to 163 lbs. ($79\frac{7}{10}$ kilogrammes, or $175\frac{9}{10}$ lbs. avoirdupois) per individual. In estimating the animal food yielded by the animals designated in the preceding table, according to the principles of Lavoisier, modified according to the localities, the consumption of Mexico in every sort of meat is 26,000,000 lbs., or 189 lbs., or 204 lbs. avoirdupois, per individual. This difference is so much the more remarkable as the population of Mexico includes 33,000 Indians, who consume very little animal food.

“The consumption of wine had formerly greatly increased since 1791, especially since the introduction of the Brownian system in the practice of the Mexican physicians. These wines, however, are only drunk by the wealthy class of the inhabitants. The Indians, Mestizoes, Mulattoes, and even the greatest number of white Creoles, prefer the fermented juice of the agave, called *pulque*, of which there is annually consumed the enormous quantity of 44,000,000 bottles, containing 48 French cubic inches each, or 58,141 cubic inches English. The immense population of Paris only consumed annually in the time of M. Lavoisier 281,000 muids of wine, brandy, cyder, and beer, equal to 80,928,000 bottles.

“The consumption of bread at Mexico is equal to that of the cities of Europe. This fact is so much the more remarkable, as at Caracas, at Cumana, and

Carthagena de las Indias, and in all the cities of America situated under the torrid zone, but on a level with the ocean, or very little above it, the Creole inhabitants live on almost nothing but maize bread, and the *jatropha manihot*. If we suppose, with M. Arnould, that 325 lbs. of flour yield 416 lbs. of bread, we shall find that the 130,000 loads of flour consumed at Mexico, yield 49,900,000 lbs. of bread, which amounts to $391\frac{8}{10}$ lbs. avoirdupois, per individual of every age. Estimating the habitual population of Paris at 547,000 inhabitants, and the consumption of bread at 206,788,000 lbs., we shall find the consumption of each individual in Paris 377 lbs. French, or $406\frac{9}{10}$ lbs. avoirdupois." At Mexico, the consumption of maize is almost equal to that of wheat. It is the food most in request among the Indians.

The market of Mexico has always been celebrated as richly supplied with eatables, particularly with roots and fruits of every sort. "It is a most interesting spectacle, which may be enjoyed every morning at sunrise, to see these provisions and a great quantity of flowers, brought in by Indians in boats, descending the canals of Istacalco and Chalco. The greater part of these roots is cultivated on the *chinampas*, called by the Europeans floating gardens. There are two sorts of them, of which the one is moveable and driven about by the winds, and the other fixed and attached to the shore. The first alone merit the denomination of floating gardens, but their number is daily diminishing.

The invention of *chinampas* had its origin in the local situation of a people, who, surrounded with enemies, were compelled to live in the midst of a little lake abounding in fish, who were forced to fall upon every means of procuring subsistence. "The oldest *chinampas* were merely bits of ground joined together artificially, and dug and sown upon by the Aztecs. These floating islands are to be met with in all the zones. Humboldt saw them in the kingdom of Quito, on the river Guayaquil, of eight or nine metres (or 26 or 29 feet) in length, floating in the midst of the current, and bearing young shoots of bambusa, pistia stratiotes, pontederia, and a number of other vegetables, of which the roots are easily interlaced. He found also in Italy, in the small *lago di aqua solfa* of Tivoli, near the hot baths of Agrippa, small islands formed of sulphur, carbonate of lime, and the leaves of the *ulva thermalis*, which change their place with the smallest breath of wind. Floating gardens are, as is well known, also to be met with in the rivers and canals of China, where an excessive population compels the inhabitants to have recourse to every shift for increasing the means of subsistence.

Masses of tufted earth, carried away from the banks, have probably originated the idea of artificial *chinampas*; but the industry of the Aztecs gradually carried this system of cultivation to perfection. "The floating gardens, of which very many were found by the Spaniards, and of which many still (1817) exist in the

Lake of Chalco, were rafts formed of reeds (*totorá*), rushes, roots, and branches of brushwood. The Indians cover these light and well-connected materials with black mould, naturally impregnated with muriate of soda. The soil is gradually purified from this salt by washing it with the water of the lake; and the ground becomes so much the more fertile as this lixiviation is annually repeated. This process succeeds even with the salt-water of the Lake of Tezcucó because this water, by no means at the point of its saturation, is still capable of dissolving salt as it filtrates through the mould. The *chinampas* sometimes contained even the cottage of the Indian, who acts as guard for a group of floating gardens. They are towed or pushed with long poles when wished to be removed from one side of the banks to the other.

“In proportion as the fresh-water lake has become more distant from the salt-water lake, the moveable *chinampas* have been fixed. Every *chinampa* forms, or formed, a parallelogram of 100 metres in length, and from five to six metres (or 328 by 16 or 19 feet) in breadth. Narrow ditches, communicating symmetrically between them, separate these squares. The mould fit for cultivation, purified from salt by frequent irrigations, rises nearly a metre, or 3.28 feet above the surface of the surrounding water. On these *chinampas* are cultivated beans, small peas, pimento (*chile*, *capsicum*), potatoes, artichokes, cauliflowers, and a great variety of other vegetables. The edges of these squares are generally ornamented with flowers, and sometimes with a hedge of rose bushes.

“The promenade in boats around the *chinampas* of Istacalco is one of the most agreeable that can be enjoyed in the environs of Mexico. The vegetation is extremely vigorous on a soil continually refreshed with water.”—*Humboldt. Thomson's Alcedo.*

The modern city of Mexico has, after the visit of Humboldt, been well described by Mr. Ward. It is situated in a plain, near lakes, and surrounded by mountains, at an elevation of 7400 feet above the level of the sea, in latitude 19 deg. 26 min. north; longitude 101 deg. 26 min. west. The population is said now to amount to nearly 200,000 of all races. Its streets intersect each other generally at right angles. On looking down on it from the neighbouring heights, it has been compared to a chessboard.

Although Humboldt describes it as “undoubtedly the finest city built by Europeans in either hemisphere,” we certainly doubt the truth of this assertion. Many of the public edifices are certainly magnificent, and the cathedral and churches contain gorgeous embellishments and treasures. There are fourteen parish churches, six additional churches, thirteen monasteries and seminaries, twenty-two nunneries, one university, six colleges, and five hospitals.

The palace of the archbishop is a plain edifice. That of the president is said to have been equally plain, and until 1842, was wretchedly furnished. After the accession of Santa Anna, Mr. Mayer says of the grand saloon in this palace:—

"In this spacious and well-proportioned apartment they have gathered a quantity of gorgeous furniture, and placed, on a platform at the northern end, under a crimson canopy, a magnificently carved and gilded throne. Various flags, alleged to have been taken from the Texans, in battle, are affixed to staffs extending from the cornice. The walls are covered with large French mirrors, and the deep windows are festooned with the most tasteful upholstery of French artistes. I have wandered over the whole of this immense pile of edifices, but I recollect nothing else about it worthy of notice. The private apartments of General Santa Anna are plain, neat, and tasteful, and a full-length portrait of General Washington adorns an obscure chamber."

There is a senate chamber and chamber of deputies behind the palace, near which also is the botanic garden—of small extent. The mint is on the north of the Palace Square, near which is the *adauna* or custom-house. The Monte Pio, or national pawnbroking establishment, is in the palace—said to be erected by Cortez: it is founded very much on the same principle as that of Paris. Mr. Mayer says;—

"You may form an idea of the number and variety of persons who derive assistance from the Monte Pio, by a walk through its extensive apartments. You will there find every species of garment, from the tattered reboso of the *lepéra* to the lace mantilla of the noble dame; every species of dress, from the blanket of the beggar, to the military cloak and jewelled sword of the impoverished officer; and, as to jewels, Aladdin would have had nothing to wish among the blazing caskets of diamonds for which the women of Mexico are proverbial."

The Minería, or School of Mines, is one of the most splendid edifices in America. "It was planned and built by Tolsa, the sculptor of the statue of Charles IV.—and is an immense pile of stone, with courts, stairways, saloons, and proportions that would adorn the most sumptuous palaces in Europe. But this is all. The apparatus is miserable; the collection of minerals utterly insignificant; the pupils few; and, among the wastes and solitude of the pile, wanders the renowned Del Rio—one of the most learned naturalists of this hemisphere—ejaculating his sorrows over the departed glory of his favourite schools."

An edifice used for the manufacture of tobacco, situated at the north-western corner of the city, and erected by the old Spanish government, has been converted into a citadel.

The Academy of Fine Arts, so highly admired by Humboldt, has, like the Minería, university, and museum, become almost untenanted. Under the old Spanish government the academy was really a school of arts, and supplied at great expense with casts of the most celebrated statuary of Europe. There are a few private cabinets of pictures, &c. In the streets, wealth and poverty exhibit their extremes.

"Go where you will," says, Mr. Mayer, "in this city you are haunted by beggars. Beggary is a *profession*; but it is not carried to quite the extent that it is in some of the Italian states, and especially the Sicilian dominions.

"The capital employed in this business is blindness, a sore leg, a decrepit father or mother, or a helpless child; in the latter case, a stout hearty boy usually straps the feeble one on his back, and runs after every passer beseeching succour. With such a stock in trade, and a good sunny corner, or wall of a church door, the petitioner is set up for life. Placed in so eligible a situation, their cry is incessant from morning to night, '*Senores amigos, por el amor de dios,*' '*for the love of the blessed Virgin!*' '*by the precious blood of Christ!*' '*by the holy mystery of the Trinity!*' repeated with many variations between their eternal scratchings, winking of lids over sightless balls, and the display of maimed limbs and every species of personal deformity. There is no '*poor-house*' in Mexico, to which such vagrant wretches are forced to go."

Whoever happens to be the successful head of a revolution, opens court ceremonies; and "*military, diplomatic, and ecclesiastical uniforms,*" and religious processions form gorgeous displays, very inconsistent with the ideas usually entertained of republican capitals. There are *four theatres*, a *Plazo de los Torros* for bull-fights, in which, like the old Spaniards, the Mexicans delight. On feast days all are joyous or idle. Mr. Gilliam, as a republican, was indignant on witnessing the Christmas festivities in the city.

"There was during the whole day, the firing of rockets from the churches, and of cannon from before the national palace, at the plaza. In the evening, General Canalizo, the dictator *pro tem.*, in his coach of state, accompanied by his guards of lancers, commanded by a general officer, rode through the streets to the *alemade* and the *pasio*. To inform plain republicans in the United States, that it was an extraordinary sight for the first officer of the republic of Mexico to appear in his coach, would not awaken their imaginations to the gaudy and royal state in which such things are done there. But never was I more surprised, and indeed indignant, than when I beheld the chief magistrate of a republican government aping the gaudy show and circumstance of royal pride to please and gull a gaping people.

"I had a thought that in the enlightened age of the nineteenth century, republicans of all the continent of America had thrown aside and disdained the tinsel of monarchical pageantry and aristocracy, basing their noble bearing alone on the soundness of their constitutional principles, and devotion to their country's weal.

"But so far from the dictator of Mexico appearing in plain garb and equipage, and like Washington assuming in public to be nothing more than a servant of the people and a private citizen, General Canalizo had his coach literally fringed and covered with gold; and I hardly knew which the most to admire, the splendid uniforms of his coachman, or that of his own. But for the fact, that the dictator, instead of the driver, wore the *shopo*, and was seated within, I would have mistaken

that Yankee mounted on his seat like a golden throne, for the dictator *pro tem.* of the republic of Mexico.

"There were also generals dressed in full uniforms, attending as outriders to his excellency, while not less than a hundred lancers were his body guard. Hang down your heads, ye respectable republicans and generals of the United States ! for you cannot aspire to being postillions and body-servants to the most high in authority.

"Having seen the big show of the dictator, I followed the crowd to the Plaza de los Torros, for I was not satisfied with my speculations, upon the different castes of society, and the moral tone pervading each. Having convinced myself that decent and respectable portions of society, embracing both sexes, visited the shows of bull-fighting, I attended the exhibition, remaining there as long as I could do so with any degree of ease or comfort. I observed a mother with three children, call their attention so particularly to the scene of blood, that they might not escape seeing all the cruel performances of the occasion. I soon left the barbarous amphitheatre, never intending to enter it again."

Mr. Mayer was told, "that unless I remained some time I was likely to lose the three great 'amusements' of Mexico, to wit, a revolution, an earthquake, and a bull-fight.

"A fight came off rather unexpectedly in the *Plaza de Torros*, an immense circus, erected when this sport was in its palmy days in Mexico.

"It was Sunday, and the people were unoccupied. The idlers had a few spare *medios*, picked up by toil, beggary, or pilfering during the week, and as to the rich, it was expected that of course they would be gratified by the sight of an exhibition from which they had been long debarred.

"The exhibition of the slaughter-house as a sport, can tend only to foster a brutal passion for blood. Death becomes familiarised as a play-thing to the multitude. They make a clown of the grim monster. They put him as a joker on the arena for Sabbath sports ; and the day that is assigned as a period of repose, thankfulness, love, and remembrance of the blessed God, is converted into a school-time of the worst passions that can afflict and excite the human heart.

"It may be said that this is not true of all classes. I grant it, and reply, that although all classes visit the circus, yet the majority of the spectators is doubtless composed of the lowest ranks, requiring most moral instruction, and least addicted to reasoning. With such a population as that of the *léperos* of Mexico (men scarcely a remove from the beasts whose slaughter they gloat on), these scenes of murder, in which bulls, matadors, and picadors are often indiscriminately slain, can only serve to nourish the most wicked passions, and to nerve the ignorant and vile to deeds of most daring criminality.

"It will be a matter of sincere congratulation for Mexican patriots, when this remnant of barbarism is abolished in their country, and the thousands which are

annually expended in bull-fights throughout the republic, are devoted to the education or rational amusement of the people."

There are, according to Mr. Mayer, scarcely any hotel accommodations in the city of Mexico. The best being a miserable establishment, only a few removes from the *Fondas* and *Mesones* of the olden time. This want of accommodation he attributes to "the fact that *travelling* is only of a recent date; a new invention, as it were, in Mexico. In former times, articles of merchandise were sent under the care of *arrieros*, who were satisfied with the accommodation of the ordinary tavern; to wit, four walls, covered with a roof, in which they might stretch their mats, pile their saddles, and sleep, living the while on tortillas, onions, pulque, and jerked meats. Whenever the better classes found it needful to visit the capital, the house of some friend was open to them, and thus hospitality prevented the creation of an honest race of Bonifaces to welcome the weary wayfarer."

Mr. Mayer, like others who have visited Mexico, describes the religious ceremonies, and especially the festival of the Virgin of Guadalupe, the patron saint of Mexico, whose shrine is richer than that of St. John Nepomuc, at Prague. Of Mexican domestic character, among the families of the higher class, he speaks favourably, although he says "too much time is devoted to the morning, the evening drive, and the theatre."

"The universal conclusion of the day with a fashionable lady in Mexico, is the theatre. She begins with mass, to which she walks in the morning with her mantilla gracefully draped around her head, and falling in folds of splendid lace over her breast and shoulders. But the night must end in full dress at the opera or theatre. It is as regular and as much a matter of course as her meals."

The houses of the Mexicans are usually built of the strongest materials, either brick or stone, and without much architectural pretension. They are erected around *patios*, or court-yards, and are from thirty to forty feet front on the street—the grand saloon being generally the length of the whole house. On the ground-floor are the porter's lodge, offices, and coach-house. "From this a flight of steps leads to an *entresol*, devoted to the domestics, while the upper story is universally the fashionable and best one. Here the family dwells in perfect seclusion from the street and neighbours, and the arcade which fronts their doors is filled with the choicest fruit and flower-trees in constant bloom. Above all this is the *azotea*, or flat paved roof, a delightful retreat on summer nights. The front windows of the houses are all guarded by balconies covered with gaily-coloured awnings; and on days of festival, when filled with the gay throng of Mexican women, and hung with tapestry and velvet, they present a most brilliant appearance.

"The carriage, and ever-harnessed mules, stand constantly in the court-yard below; and the postillion is ready to mount and sally forth at a moment's notice until after dark, when the large front gate is closed, locked, and barred; and the house becomes as quiet and secure as a castle, with which no communication from

without is permitted, until you tell your name, or signify to the porter the object of your visit. Until this ceremony has passed, no bolt is drawn in the wicket or latch raised to admit you ; and the caution is extremely necessary, on account of the frequent robberies that have been committed by allowing unknown persons to enter after dark."

The "old school" says Mr. Mayer, "seems to have taken refuge among the Mexicans. They are formally, and I think, substantially, the politest people I have met with."

The Alameda is a great resort for carriages to drive, and for students, priests, and monks to loiter. The *Paseo nuevo* is another drive about a mile long, bordered with trees, and adorned with fountains and statues. It is crowded on festivals. Every person of consideration possesses an equipage.

"It is not thought '*exactly proper*,' " observes the same writer, "for a lady ever to walk, except to mass, or, sometimes when she goes shopping. The coach, therefore, on all gala days, is sure to appear on the Paseo with its fair burden, dressed in the French style as for a dinner party or a ball. When I first arrived in Mexico, it was rare to see a bonnet on such occasions ; but that awkward appendage of fashionable costume was becoming gradually in vogue before I left.

"For an hour or more, it is the custom to pass up and down the sides of the Paseo, nodding and smiling at the cavaliers, who show off their horsemanship along the centre of the road. Here the utmost luxury and style are exhibited in the equipment of carriage and animals. Gold embroidery, silver plating, and every ornament that can add splendour to harness and livery are brought forth. To such an extent is the taste for these exhibitions carried, that one of the millionaires of Mexico appears occasionally at the Paseo, on a saddle which (without counting the value of the rest of his caparison) cost the sum of five thousand dollars. It was the *chef-d'œuvre* of an honest German saddler, who made it, and retired from trade to his beloved 'father land.'

"On approaching this charming drive, the whole plain of the Valley of Mexico is at once revealed to you, without passing a dirty suburb. On your right, is the cypress-covered and castle-crowned hill of Chapultepec, formerly the site, it is alleged, of one of Moctezuma's palaces.

"On the right, and before you are long lines of aqueducts sweeping to the city from the hills, and in others, studded with lakes, cultivation, and beautiful groves, until the distant view is closed by the volcanoes, whose snows rest against the blue sky, uncovered at this season, by a single cloud.

"Below is the great square or Plaza ; a large paved area, fronted on the north by the cathedral, on the east by the national palace (the residence of the presidents), to the south of which, again, are the museum and a stone edifice recently built in tasteful style for a market. The corner-stone of this was laid after I arrived at Mexico, and before I left the building was nearly completed. Until that time the fruits, flowers, vegetables, and most of the necessities of the table, had been sold on that spot, in shambles and booths built of *bamboos and reeds, sheltered from the rain and sun by thatched roofs*?

"In the south-western corner of the square in the Parian, an unsightly building (erected, I believe, since the revolution) which greatly mars the effect of the Plaza. It is a useful establishment, however, as it affords a large revenue to the municipality, and is the great bazaar where every article requisite for the dress of Mexicans, male or female, may be purchased. On the pavement which runs round it, sit numbers of coachmen, whose stand is in the neighbourhood, and crowds of women with ready-made shoes. Not the least curious, however, among the multitude, with which this side-walk is generally thronged, are about a dozen '*evangelistas*,' or 'letter-writers,' whose post is always on the curb-stones of the eastern front of the Parian. A huge jug of ink is placed beside them : a board rests across their knees ; a pile of different coloured paper (most of which is either cut, *valentine fashion*, or flourished over and adorned with pen-and-ink orna-

ments) is placed on it, and, on a stool before them, sits some disconsolate-looking damsel or heart-broken lover, pouring out a passion which the scribe puts into becoming phraseology. It is an important trade; and more money is earned in Mexico by this proxy-making love, than perhaps anywhere else. You can have a '*declaration*' for one *rial*; a *scolding letter* for a *medio*; and an *upbraiding epistle*, full of daggers, jealousy, love, and tenderness (leaving the unfortunate recipient in a very distracted state of mind), done upon azure paper be-sprinkled with hearts and doves, for the ridiculous price of *twenty-five cents*!

"West of the Parian, and all around the southern and western sides of the Plaza, or those portions of it which are not directly occupied by the cathedral and national palace, run the arched Portales, similar to the arcades of Bologna. These are filled with gay shops, pedlars, *cafés*, old clothes, toys, flower-venders, sweetmeats, bookstalls, cutlers, curiosity-hunters, antiquities (veritable and doubtful), and the usual crowd of loungers and quidnuncs. Here the last revolution, or the probability of a new one, is in continual discussion, by knots of idlers. Above stairs, in some of the dwellings, are gambling-houses, as formerly in the Palais Royal, with which the scene here presented does not, of course, vie in taste or splendour.

"Opposite to the southern end of the Parian is the *Casa Municipal*, or town-hall, in the lower story of which is the Lonja (the exchange of the merchants of Mexico), a noble room, filled with all the gazettes of the republic, of Europe, and the United States, and adjoined by an apartment in which readers may occasionally amuse themselves with a game of billiards.

"In order to afford you some idea of the wealth of the church, generally, and passing over plate glass and crystal, silver frames, lamps, carving and gilding enough to make an ordinary metropolitan church blaze with splendour, I will only mention one object in the body of the building—the altar and its accessories.

"The cathedral occupies a space of 500 feet by 420 front. The main altar is not erected against the wall, but near the centre of the edifice, beneath the dome. From this, extending round the choir probably 200 feet, there is a rail between four and five feet high, and of proportionable thickness, composed of *gold, silver*, and a small alloy of *brass*. This is surmounted with silver statues for candles. In front of the altar is the choir, itself a church, built of dark woods of the rarest antique carving. The altar (placed upon a marble platform, elevating it from the floor of the building, and covered with gold and silver ornaments, candlesticks and crosses) is of wrought and polished silver; and the whole is surmounted by a small temple, in which rests the figure of the Virgin of Remedios, who enjoys the exclusive right to *three petticoats; one embroidered with pearls, another with emeralds, and a third with diamonds, the value of which, I am credibly informed, is not less than three millions of dollars*! This, you will recollect, is only *one part of one church in Mexico*, and that one said not to be the richest!

"Around this splendid mine of wealth are half-naked Indians, gaping with surprise, or kneeling to the figure of some favourite saint—the misery of the man a painful contrast with the splendour of the shrine!

"Passing from the cathedral door to the south-eastern portion of the city, you reach the outskirts, crossing, in your way, the canals from the lake. I have rarely seen such miserable suburbs; they are filled with hovels built of sun-dried bricks, often worn with the weather to the shape of holes in the mud, while on their earthen floors crawl, cook, live, and multiply, the wretched-looking population of *léperos*.

"This word, I believe, is not pure Spanish, but is derived originally, it is said, from the Castilian *lepra*, or leper; and although they do not suffer from that loathsome malady, they are quite as disgusting.

"Blacken a man in the sun; let his hair grow long and tangled, or become filled with vermin; let him plod about the streets in all kinds of dirt for years, and never know the use of brush, or towel, or water even except in storms; let him put on a pair of leather breeches at twenty, and wear them until forty, without change or ablution; and, over all, place a torn or-blackened hat, and a tattered blanket begrimed with abominations; let him have wild eyes, and shining teeth, and features pinched by famine

into sharpness; breasts bared and browned, and (if females) with two or three miniatures of the same species trotting after her, and another certainly strapped to her back: combine all these in your imagination, and you have a recipe for a Mexican *lépero*.

"There, on the canals, around the markets and *pulque* shops, the Indians and these miserable outcasts hang all day long; feeding on fragments, quarrelling, drinking, stealing, and lying drunk about the pavements, with their children crying with hunger around them. At night they slink off to those suburbs, and coil themselves up on the damp floors of their lairs, to sleep off the effects of liquor, and to awake to another day of misery and crime. Is it wonderful, in a city with an immense proportion of its inhabitants of such a class (hopeless in the present and the future), that there are murderers and robbers?

"In the Indian population which pours into the capital from the lakes, I must say that there is apparently more worth and character. You see them lolling about in their boats on the canals, and passing and repassing in their canoes, plying between the city and Chalco and Tezcoco. It is a beautiful sight to behold these tiny vessels skim like floating gardens to the quays in the morning, laden to the water's edge with the fruits, flowers, and vegetables, that hide the skiff that bears them.

"The old houses in this neighbourhood, rising out of the canals, the sluggish waters, and the dark multitude of the better classes in fanciful dresses, remind one strongly of Venice.

"Skirting the canal, and leading to the plain which adjoins the *chinampas*, or former floating gardens, is the *Paseo de la Viga*, a public drive frequented by the *beau monde*, both in coach and on horseback, during the season of Lent. Scarcely an afternoon passes, at that period of the year, that the observer will not find the canal covered with gay boat-loads of Indians, passing homeward from market, dancing, singing, laughing, strumming the guitar, and crowned with wreaths of *poppies*. I do not know the origin of the custom of wearing this forgetful flower; but it is both a healthier and more poetic oblivion than that resorted to by many folks in other lands, after a day of toil.

"Turning westward, we again reach the great square.

"As we pass the front of the national palace, from out of its main portal dash fifty gaily-caparisoned hussars, followed by a coach richly decked with crimson velvet and gold, drawn by four white horses, and driven by a Yankee coachman. Behind this dash fifty more hussars, while at the side of the coach, six aide-de-camps rein in their mettlesome chargers. There is but one person in the vehicle. His dress is that of a general of division, with red facings and embroideries. He wears a number of decorations around his neck, while a medal blazing with diamonds, voted to him by the nation, rests on his bosom. His sword-handle is studded with diamonds, and his hand rests on a diamond-headed cane. He is uncovered, and, as he passes and bows gracefully to your salutation, you recognise the President of the Republic?

"The departure of the president from the palace has attracted a crowd. The adjoining market, ever filled with people, pours forth its multitudes into the square."

Speaking of the crowds who frequent the public walks, Mr. Mayer remarks,

"The gay throng disperses, as the moon rises from behind the mountains, pouring a flood of clear light, bright as the day in other lands, over the tranquil landscape.

"The moonlight of Mexico is marvellously beautiful. This city is 7500 feet above the level of the sea, and nearly that number of feet closer to the stars than we are; the atmosphere, consequently, is more rarefied, and the light comes, as it were, pure and pellucid from heaven: you seem able to touch the stars, so brilliantly near do they stand out relieved against the background of an intensely blue sky. Strolling on such nights in Mexico, when I saw the sharp lines of tower and temple come boldly out with shape and even colour, almost as bright, yet softer than at noon-day, I have often been tempted to say that the moonlight you get at home (much as it is the theme of poets and lovers), is but second-hand stuff, compared with that of Mexico.

"And so with the climates. Between the sea-shore at Vera Cruz and the volcanoes, whose eternal snows hang over Mexico, you have every climate of the world.

"In the valley there is a perpetual spring. For six months in the year (the winter

months, as they are called), rain never falls; during the other six months, showers occur almost daily. It is never hot—never very cool, and you may wear your cloak or your summer-dress the whole year, according to the temper of your nervous system. One side of the street is always *too* warm at noon. Cold and sleeting as it is here in January, the roses are already blooming freshly in the gardens of Mexico. Nor is there perceptible change of foliage on the forest-trees; the new leaves push off the old ones with a ‘gentle force,’ and the regeneration of the seasons is effected without the process of fading, withering, and dying, which makes with us the melancholy days of autumn ‘the saddest of the year.’

“To look at the external world, you would say there was no such thing as death in Mexico. The rose and the leaf you admire to-day, are replaced to-morrow, by fresh buds and renewed verdure.

ENVIRONS.—“By a road leading south-westwardly from Chapultepec, at the distance of about a mile, you reach Tacubaya, a town somewhat celebrated in the history of Spanish diplomacy. It is a quiet country village, containing many delightful residences of the Mexican merchants, and is chiefly remarkable for a palace of the archbishop, surrounded by beautiful gardens and groves, from the *azotéa* of which there is one of the finest views of the volcano of Popocatepetl, and the neighbouring mountain of Iztaccihuatl.

“St. Augustin is another village of which I have already spoken; and St. Angel is one of nearly the same character, except that the views from its *azotéas* over the valley and city, are perhaps more beautiful.

“The pleasantest ride, however, about the vale or its adjoining mountains, is to the ruins known as ‘*El Desierto*,’ or the Desert; the remains of an abandoned Carmelite convent, built among the rocky recesses of the western Sierra.

“It is a fashionable ride of about seven leagues, and parties of gentlemen, and even ladies, make it a resort for agreeable *pic-nics*. The edifices were built between two hills, and are now going rapidly to decay, yet there are some remains of cells which still retain their coverings, while the main buildings are unroofed and almost choked with luxuriant trees and flowering shrubbery.”

Mr. Mayer and others describing the out-door appearances of the population bring forward the *lépero* as conspicuous. He is described as a beggar, thief, porter, and in any character which his despicable condition permits.

The aguador or water-carrier is another peculiar character. His jars are suspended from his head. Indians from the country carry turkeys, chickens, and other birds in coops or cages, or earthenware, or fruit, around to sell. Others, men and women, drive asses about laden with vegetables, especially onions and radishes.

A tinkle of a bell at the door of the cathedral sacristy, and a roll of drums calling out the guard of honour at the palace-gate, give warning of a change of scene, and collect the multitude towards the spot. Another scene is described by Mr. Mayer:—

“Slowly issues a gaily-painted coach with glass windows on all sides, drawn by spotted mules; a priest in his vestments sits within; a band of boys walk on each side chanting a hymn; and in a moment a death-like stillness pervades the whole square. From the tradesman, selling his tapes under the Portales, to the thief, who has barely time to conceal the handkerchief in his dirty blanket, the whole crowd is uncovered and kneeling: the Host is passing to the house of some dying Catholic!

"The carriage turns a corner, and the square is alive again; the tradesman to sell, the lépero to steal, and the lesson of death is forgotten for ever!"

The Mexican coaches are said still to be of the old heavy, almost globular form, suspended on clumsy carved and gaudy frame-work, dragged by mules almost hidden in leather and brass harness, bestridden by a postillion in leather embroidered jacket, short leggings, broad-brimmed hat, and long spurs. The military music of Mexico is highly praised by Mr. Mayer.

"It would be improper," he observes, "in speaking of the Mexican military, not to notice, especially, their excellent bands of music. The Spaniards transplanted their love and taste for this beautiful science to Mexico. The Indians have caught the spirit from their task-masters;—and whether it be in the tinkling guitar or the swelling harmonies of a united corps, you can scarce go wrong, in expecting an exhibition of the art from a native. It is the custom for one of the regimental bands to meet after sundown, under the windows of the palace in the Plaza, which is filled with an attentive crowd of eager listeners to the choicest airs of modern composers.

"I have said, that this musical taste pervades all classes; and it was, therefore, to be hoped that a regularly established operatic corps would have readily succeeded in the capital. The revolution of 1841 interfered with it at the outset, in the months of August and September; and, from the unfavourable location of the house and other circumstances, the whole enterprise was visited with a series of disastrous losses that left the management in July, 1842, with a deficit of upward of 32,000 dollars. The singers were good; the prima donna and basso unexceptionable; but the establishment never became fashionable.

"Not so, however, with the theatres;—three of which were almost constantly in operation while I resided in Mexico. The 'Principal,' the resort of the old aristocracy, was the theatre of staid fashion;—the 'Nuevo Mexico,' a haunt of the newer people, who looked down on the 'legitimate drama,' and tolerated the excitement of innovation and novelty;—and the 'Puente Quebrada,' a species of San Carlino, where 'the people' revelled in the coarser jokes and broader scenes of an *ad libitum* performance.

"I frequently visited the Principal, but kept a box with several young friends at the Nuevo Mexico, where I found the greatest advantage in the study of the Spanish language, from the excellent recitations of the 'comicos.' Most of them were Castilians, who spoke their native tongue with all the distinctive niceties of pronunciation, besides producing all the newest efforts of the Spanish muse.

"It was singular to observe, how from a small beginning and really excellent performances, the taste and wealth of Mexico was gradually drawn from its old loves at the Principal to the daring upstart. The theatre is a Mexican necessary of life. It is the legitimate conclusion of a day, and all go to it;—the old, because they have been accustomed to do so from their infancy; the middle-aged, because they find it difficult to spend their time otherwise; and the young, for a thousand reasons, which the young will most readily understand.

"The boxes are usually let by the month or year, and are, of course, the resort of families who fill them in full dress every evening, and use them as a receiving-room for the *habitués* of their houses; although it is not so much the custom to visit in the theatre as in Italy.

"The pit is the paradise of bachelors. Its seats are arm-chairs, rented by the month, and of course never occupied but by their regular owners. The stage is large, and the scenery well painted; but the whole performance becomes rather a sort of mere *repetition* than *acting*, as the 'comicos' invariably follow the words, uttered in quite a loud tone by a prompter, who sits in front beneath the stage, with his head only partially

concealed by a wooden hood. A constant reliance on this person greatly impairs the dramatic effect, and makes the whole little better than bad reading; but I was glad to perceive that the actors of Nuevo Mexico had evidently studied their parts, and really performed the characters of the best dramas of the Spanish school.

"Even the riding horses of the Mexicans are not yet freed from the ancient lumber and trappings with which their ancestors covered them.

"I have forgotten to say any thing to you hitherto of the parades of troops for which this capital is in some degree famous. As I profess to have no military knowledge, you must not expect a very critical account of their appearance and manœuvres, but I have seldom seen better-looking regiments in Europe than the 11th infantry, under the command of Lombardini. The uniform is white, like the Austrian, and is kept in excellent order. The arms are clean and bright, and the officers of division appear to be well trained, and to have imparted their training to the men. On the 13th of June last, about eight thousand of these troops were brought together, to be reviewed by General Santa Anna, on the meadows south of the city. In line they had an extremely martial bearing, and, so far as I was able to judge of their skill, the sham-fight that took place afterward was admirably executed. Excellent and daring riders as are all the Mexicans, they must ever have a decided advantage in their cavalry; and, although they did not present so splendid an appearance in equipments as some of the other regiments, I have no doubt they constitute the most effective arm of the Mexican service. Indeed, almost all the foreigners (and even Texans) with whom I have spoken in regard to the qualities of these men, concur in a high estimate of the Mexican soldier, although they do not think so well of the Mexican officer. This, in all probability, arises from the irregular manner in which persons arrive at command, and the want of soldier-like education and discipline. Officers have been, most frequently, taken at once from private life, or pursuits by no means warlike, and found themselves suddenly at the head of troops, without a knowledge of their duties, either in the barrack, camp, or field; or a due estimate of the virtues of obedience, and that disciplined courage, arising from a perfect self-reliance in every emergency. The result of this unfortunate state of things has been, that, in conflicts with the Texans, while the men have often appeared anxious to fight, they lacked officers who were willing to lead them into the thick of the *mêlée*.

"You can fancy nothing more odd than the manner in which this army is recruited. A number of men are perhaps wanted to complete a new company, and a sergeant with his guard is forthwith despatched to inspect the neighbouring Indians and Meztizoes. The subaltern finds a dozen or more at work in the fields; and, without even the formality of a request, immediately picks his men and orders them into the ranks. If they attempt to escape or resist they are at once *lassoed*; and, at nightfall, the whole gang is marched, tied in pairs, into the *quartel* of the village or the guard-room of the palace, with a long and lugubrious procession of wives and children, weeping and howling for the loss of their martial mates. Next day the 'volunteers' are handed over to the drill-sergeant; and I have often laughed most heartily at the singular group presented by these new-caught soldiers on their first parade under their military tutor. One-half of their number are always Indians, and the rest, most likely, *léperos*. One has a pair of trousers, but no shirt; another a shirt and a pair of drawers; another hides himself, as well as he can, under his blanket and broad-brimmed hat; another has drawers and a military cap. But the most ridiculous-looking object I remember to have seen in Mexico, was a fat and greasy *lépero*, who had managed to possess himself of a pair of trousers that just reached his hips, and were kept up by a strap around his loins, together with an old uniform coat a great deal too short for him, both in the sleeves and on the front. As he was not lucky enough to own a shirt, a vast continent of brown stomach lay shining in the sun between the unsociable garments! He held his head (which was supported by a tall stock) higher than any man in the squad, and marched magnificently—especially in 'lock step'.

"The drilling of these men is constant and severe. The sergeant is generally a well-trained soldier, and unsparing in the use of his long hard rod for the slightest symptom of neglect.

"During the ceremonies at the cathedral and churches, ladies of the first rank mix indiscriminately with the multitude.

"The commonest woman of the middle ranks you encounter on the streets, with but a fanciful petticoat, and her shawl or *reboso*, struts a queen—her feet small almost to deformity. Her figure, though full to *embonpoint*, you never think too fat; her lively enthusiasm always seems tempered and delicately subdued by the softness of her eye, and you feel that her complexion, sallow or dark as it often is, is yet no more than

‘The embrowning of the fruit that tells
How rich within the soul of sweetness dwells.’

Without the reboso the dress is scarcely dress at all: one garment, besides a petticoat, braced with a sash around the waist, while the hair falls in a long plait down the back. *With it*—their costume is made up. Flung gracefully over the left shoulder and passed across the mouth—you see nothing but the eyes, which are her greatest charm, and she never attempts to conceal them or neglect their power.

"In speaking of the fine eyes, the beautiful feet, and the queenly tread of the Mexican ladies, and their costume, I should not forget to mention that an embroidered India crape shawl, blazing with all the colours of the rainbow and a painted fan, are indispensable portions of a complete dress. The fan is none of your new-fangled inventions of feather and finery, but the old-fashioned reed and paper instruments used by our grandmothers. The opening and shutting, the waving and folding, of these is an especial language. They touch them to their lips, flirt them wide open, close them, let their bright eyes peep over the rim, display their jewelled hands and witching eyes, and, in fact, carry on a warfare of graceful coquetry from behind these pasteboard fortresses, that has forced, ere now, many a stout heart to cry for quarter!"

Describing the Easter holidays Mr. Mayer says,—

"At the doors of most of the sacred buildings ladies were seated, who received alms on large silver dishes, and rewarded you with a sweet smile; but in the sacristy of the cathedral a system of begging was carried on that I did not notice elsewhere. It was a regular fair for Indulgences.

"The body of our Lord, in wax, was laid on a bier near the door as you entered from the cathedral, and near it another figure was set up, representing him as he came bleeding and wasted from the scourgers. Close to these two figures sat priests begging every passer for a donation in return for Indulgences. 'Ten years' indulgence for an alms to the Holy Sepulchre,' said one of them, with the plate before him;—and 'twenty years' indulgence for an alms for the redemption of the faithful in captivity,' shouted a tall blue-gowned Franciscan, who stood near the door as you went out, over-bidding his less liberal competitor between the figures.

"*25th, Good Friday.* The gay dresses of yesterday are exchanged for deep black, worn by both men and women, and the day is celebrated by solemn services. I missed seeing the 'descent from the cross,' in the church of Balbanera, which is said to be performed by puppets, and to be admirably well executed.

"*26th.* This is the last day of the ceremonies, and at half-past nine in the morning the injunction was taken from the bells and carriages. The streets were of course immediately filled with all the equipages of the city, whose postillions only waited for the first sound from the church-towers to dash out of their court-yards. The clang of the bells was incessant, and at the same moment, the air was filled with the smoke and explosion of myriads of crackers and fireworks, called '*Judases*' and '*heretics*' extended on ropes across the streets. The multitudes of dogs with which the city is infested, scared at the unusual racket, howled along the streets, and the great amusement of the *léperos* was to trip the poor beasts with ropes as they dashed wildly over the crowded thoroughfares. And so ended in smoke, yells, jingling, carriage-rolling, horse-tramping, Judas-bursting, dog-tripping, and folly, this farcical caricature of the most awful event in the history of religion. In the vanity of personal ostentation its effect is thrown away on the better classes, and it is entirely lost in the barbaric spectacle and tinsel show which are got up to bewilder and surprise the ignorant and low."

CHAPTER XI.

OLD CALIFORNIA.

CALIFORNIA, OLD, is a long narrow peninsula of North America, situated between latitudes 22 deg. 25 min. north, and about 32 deg. 30 min. north lat.; bounded on the east by a gulf of the same name, and on the west by the Pacific ocean, lying within the limits of Cape St. Lucas on the south, the gulf of the river Colorado on the east, and some point near St. Diego, west about 32 deg. 16 min. north on the Pacific, and Cape Blanco de San Sebastian, which is considered its west limit. Old California is about 720 miles in length from Cape San Lucas to St. Diego. Its width varies from thirty to 110 miles from the Gulf to the Pacific. Alcedo (in Thompson's edition, 1818), remarks, "The climate is various, according to the different heights of the land; but for the most part it is excessively hot. The ground is uneven, rough, and barren, full of ridges of mountains, stony and sandy places; lacking moisture, but abounding in mules, horses, and neat cattle, and all sorts of swine, goats, and sheep, which have multiplied in the same proportion as the dogs and cats introduced by the Spaniards. There is found in the woods a kind of animal called *taye*, about the size of a calf of a year and a half old, and very much resembling one; its head and skin being like those of a deer, its horns very thick, and similar to those of a ram; its hoof is large, round, and cleft like that of an ox; the tail is small, the flesh well tasted and delicate. There is also another animal very like a sheep, although somewhat larger; of these there are black and white, bearing quantities of wool very easy to be spun, and their flesh is very delicate. Here are also found deer, hares, rabbits, *berrendos*, and *coyotes*, a species of fox, and called by this name in Nueva Espana. In the *serrania*, or mountainous parts, there are wild hogs, cats, *tigers*, and a species of beaver. This country abounds in reptiles, as vipers, snakes of different sorts, scorpions, spiders, ants, lizards, and tarantulas; but it is free from bugs, fleas, and *niguas*. Of birds, it produces turtle-doves, herons, quails, pheasants, partridges, geese, ducks, wild ducks, ring-doves, and some birds of prey, as sparrow-hawks, vultures, falcons, horned owls, eagles, and also jackdaws, those too which they call *zopilotes* in Nueva Espana, and others which they call *auras* (or West Indian crows), screech-owls, and different birds not known in any other parts. This country is extremely barren of wood; and only towards the cape of Sanducas, where the country is most level, fertile, and temperate, are there any trees to be found. Here, however, we have that peculiar tree called the *pitajaia*, the branches of which are fluted, and grow up straight from its trunk, bearing no leaf; on the same branch hangs the fruit, having the rind covered with prickles; so that it appears to some to be a species of the *trinau* (thistle-plant), although the fruit is

whiter and more delicate: some produce fruit of a reddish, and some of a yellow tint, which is extremely well-flavoured, and is either sweet or a little acidulous; the same is esteemed an excellent medicine in the venereal disease. From the fruit-trees aromatic gums are gathered in such abundance that they are mixed with grease for careening the bottoms of ships; and from the crude root of the *mezcales* they compose the drink so-called. They have a sort of aloes, from strips of which they make nets; and from other herbs, in a manner which is truly curious, they manufacture bowls and cruets to eat and drink out of. The Indians who inhabit the river Colorado, fabricate from the same herbs troughs or trays, which they call *coritas*, so large as to contain two hundred weight of maize. In them they carry by water, fruits and different articles from one shore to another. They have besides the alimentary herb called *yucas*, the Spanish potato, and the *gicamas*. This country produces also olives, figs, vines, wheat, maize, French beans, water-melons, melons, gourds, chickpeas, and all kinds of garden herbs, for which it is indebted to the Jesuits, who first planted them here. There are sufficient indications of the existence of every sort of metal. The quantity of fish and shell-fish found on its coasts is incredible; it is of every description, and among others, the profusion of pilchards is most astonishing; these being at certain seasons left in shoals dry upon the beach. Whales are also found here, and on the exterior coast shells of the most beautiful lustre may be collected, some of these being more brilliant than the finest mother-of-pearl, and covered with a blue similar to that of the most delicate lapis-lazuli. The pearl fisheries in these parts are much favoured by the shallowness of the water. This country was discovered in the year 1526 by the celebrated Hernan Cortéz, as he was endeavouring to find a passage from the North to the South Sea. Its conquest from that time had often been attempted, but without effect, until the year 1679, when, pursuant to the king's direction, it was invaded by Admiral Don Isidro Otondo, and was settled by the missionaries of the extinguished order of the Jesuits, under the direction of the Father Eusebio Francisco Kino, who first began to bring the infidel Indians under subjection."—*Alcedo*.

A chain of mountains runs through the centre of the peninsula, of which the most elevated, the Cerro de la Giganta, is from 1400 to 1500 metres (from 4592 to 4920 feet) in height, and appears of volcanic origin. At the foot of the mountains of California the soil is sand, or a stony stratum, on which cylindrical *cacti* (*organos del tunal*) shoot up to extraordinary heights. We find few springs; and it is remarked by Alcedo, that the rock is naked where the water springs up, while there is no water where the rock is covered with vegetable earth. Wherever springs and earth occur together, the fertility of the soil is extraordinary. It was at these plains, of which the number is far from great, that the Jesuits established their missions. The maize, the *jatropha*, and the *dioscorea*, vegetate vigorously; and the vine yields excellent grapes. In general, however, Old California, on account of the arid nature of the soil, and the want of water and vegetable earth in the

interior of the country, will never be able to maintain a great population any more than the northern part of Sonora, which is almost equally dry and sandy. Of all the natural productions of California, the pearls have, since the sixteenth century, been the chief attraction to navigators for visiting the coast of this desert country. They abound particularly in the southern part of the Peninsula, and the pearl-oyster is particularly to be found in the Bay of Cerralvo, and round the islands of Santa Cruz and San José. The most valuable pearls in the possession of the court of Spain were found in 1615 and 1665, in the expeditions of Juan Yturbi and Bernal de Pinadero. During the stay of the Visitador Galvez in California, in 1768 and 1769, a private soldier in the *presidio* of Loreto, *Juan Ocio* was made rich in a short time by pearl fishing on the coast of Cerralvo. Since that period the numbers of pearls of California brought annually to market were almost reduced to nothing. The Indians and negroes, who followed the severe occupation of divers, have been frequently drowned, and often devoured by sharks. The divers have always been poorly paid by the whites. Near the town of Angelloos there are said to be rich gold ores, and gold and silver are found in separate deposits. In California the Jesuits obtained, under the Spanish government, a complete ascendancy over the soldiery posted at the *presidios*. By a *cedula real*, all the detachment of Loreto, even the captain, were placed under the command of the father at the head of the missions.

The village of Loreto was founded under the name of Presidio de San Dionisio, in 1697. In the reign of Philip V. especially after the year 1744, the Spanish monasteries in California were greatly increased. The Jesuits, in a very few years, built sixteen villages in the interior of the Peninsula. After their expulsion in 1767, California was confided to the Dominican monks of the city of Mexico, who were in every respect inferior to the Jesuits, and also to the Franciscans on the coasts of New California. In the north parts of Old California rain does not fall for nine or ten months. The gulf-shore is remarkably low, without harbours, and the water shallow. There are within the gulf several islands. The western coast is precipitous, rocky, dangerous to approach, and with but few places of anchorage. Fresh water is scarce, except at Port St. Quentin. Ruy de la Magdalena is another harbour.

CHAPTER XII.

NEW OR UPPER CALIFORNIA.

THE first permanent Spanish settlement was made in the year 1769, at the present town of San Diego, in latitude 32 deg. 41 min.

Upper, or New California, extends along the Pacific from about lat. 32 deg., to Cape Mindicino in latitude 40 deg. 19 min., and from the coast to the east, as

far as the boundaries of the north-eastern departments of New Mexico. The exact area of Upper California is undefined, and, excepting as far as the journeys under the exploring expedition, the interior has been but inadequately explored.

RIVERS.—The chief rivers of New California are the Sacramento and the Colorado. Among the harbours on this coast, the principal are the ports of San Francisco, situated on the bay of that name, Monterey and San Diego, and several others of lesser note. San Carlos de Monterey is the capital of California, and has a tolerable harbour.

SOIL AND CLIMATE.—The soil of New California, according to the description of Alcedo, is as well watered and fertile as that of Old California is arid and stony. It is, he says, one of the most picturesque countries which can be seen. The climate is much more mild there than in the same latitude on the east coast of the new continent. The sky is foggy, but the frequent fogs, which render it difficult to land on the coast of Monterey and San Francisco, give vigour to vegetation and fertilise the soil, which is covered with a black and spongy earth. In the eighteen missions which now (1812) exist in New California, wheat, maize, and haricots (*frijoles*), are cultivated in abundance. Barley, beans, lentiles, and *garbanzos*, grow very well in the fields in the greatest part of the province. Good wine is made in the villages of San Diego, San Juan Capistrano, San Gabriel, San Buenaventura, Santa Barbara, San Luis Obispo, Santa Clara, and San José, and all along the coast south and north of Monterey, to beyond the 37 deg. of latitude. The European olive is successfully cultivated near the canal of Santa Barbara, especially near San Diego, where an oil is made as good as that of the valley of Mexico, or the oils of Andalusia.

The population of New California, including the Indians only attached to the soil of the missions, was, according to Alcedo, in “1790, 7748 souls; in 1801, 13,668 souls; and in 1802, 15,562 souls.

“Thus the number of inhabitants has doubled in twelve years. Since the foundation of these missions, or between 1769 and 1802, there were in all, according to the parish registers, 33,717 baptisms, 8009 marriages, 16,984 deaths. In 1791, according to the tables published by M. Galiano, the Indians sowed in the whole province only 874 bushels of wheat, which yielded a harvest of 15,197 bushels. The cultivation doubled in 1802; for the quantity of wheat sown was 2089 bushels, and the harvest 33,576 bushels.

“The following statement, comprises the number of live stock in 1802: Oxen, 67,782; sheep, 107,172; hogs, 1040; horses, 2187; mules, 877.

“In 1791 there were only 24,958 head of black cattle (*ganado mayor*) in the whole of the Indian villages. The population of New California would have augmented still more rapidly if the laws by which the Spanish *presidios* have been governed for ages were not directly opposite to the true interests of both mother-country and colonies. By these laws the soldiers stationed at Monterey are not

permitted to live out of their barracks and to settle as colonists. The Indians who inhabit the villages of New California have been for some years employed in spinning coarse woollen stuffs called *frisadas*; but their principal occupation, of which the produce might become a very considerable branch of commerce, is the dressing of stag-skins. In the *cordillera* of small elevation which runs along the coast, as well as in the neighbouring *savannas*, there are neither buffalos nor elks; and on the crest of the mountains which are covered with snow in the month of November, the *berrendos*, with small chamois horns, feed by themselves. But all the forest and all the plains covered with *gramina*, are filled with flocks of stags of a most gigantic size, the horns of which are round and extremely large. Forty or fifty of them are frequently seen at a time: they are of a brown colour, smooth, and without spot. Their horns, which are not palmated, are nearly fifteen decimetres (four and a half feet) in length. It is affirmed, that this great stag of New California is one of the most beautiful animals of Spanish America. It probably differs from the *wewakish* of M. Hearne, or the *elk* of the United States, of which naturalists have very improperly made the two species of *cervus Canadensis* and *cervus Strongyloceros*. The horns of these stags are said to be nine feet long, and the animal, when running, throws up its head to rest them on its back."—*Thompson's Alcedo*.

The missions of New California, which had been founded up to 1803, were—

San Diego, a village founded in 1769, fifteen leagues distant from the most northern mission of Old California. Population in 1802, 1560.

San Luis el Rey de Francia, a village founded in 1798, 600.

San Juan Capistrano, a village founded in 1776, 1000.

San Gabriel, a village founded in 1771, 1050.

San Fernando, a village founded in 1797, 600.

San Buenaventura, a village founded in 1782, 950.

Santa Barbara, a village founded in 1786, 1100.

La Purissima Concepcion, a village founded in 1787, 1000.

San Luis Obispo, a village founded in 1772, 700.

San Miguel, a village founded in 1797, 600.

Soledad, a village founded in 1791, 570.

San Antonio de Padua, a village founded in 1771, 1050.

San Carlos de Monterey, capital of New California, founded in 1770.

San Juan Bautista, a village founded in 1797, 960.

Santa Cruz, a village founded in 1794, 440.

Santa Clara, a village founded in 1777, 1300.

San José, a village founded in 1797, 630.

San Francisco, a village founded in 1776, with a fine port. This port has been frequently confounded by geographers with the port further north under the

38° 10' of latitude, called the Puerto de Bodega. Population of San Francisco, 820.

The number of whites, *Mustees* and Mulattoes, who live in New California, either in the *presidios*, or in the service of the monks of St. Francis, was at that time about 1300 ; for in the two years of 1801 and 1802, there were in the caste of whites and mixed blood 35 marriages, 182 baptisms, and 82 deaths. The population of the intendancy of New California was, in 1803, 15,600.

Such was the condition of California under the Spanish monarchy and church missions.

The only recent accounts of New California, upon which we can place any reliance, are those given by Captain Wilkes, commander of the exploring expedition of the United States by sea. He sent a party overland from Oregon, and he entered with his ships the Bay of St. Francisco from the Pacific, and proceeded up the country. An overland expedition from the United States to Oregon and California, of which a most interesting journal was kept by the commander, Captain Fremont, of the *Topographical Engineers*. From these two works we have extracted and condensed the following sketches of St. Francisco, and the interior of New California.

According to the account drawn up by Captain Wilkes :—

On approaching the coast in the neighbourhood of San Francisco, the country has by no means an inviting aspect. To the north it rises in a lofty range of mountains, whose highest summit is called Table Hill ; an iron-bound coast extends from Puerto de los Reyes to the mouth of San Francisco.

To the south extends a sandy beach, behind which are the San Bruno sand-hills. There is no appearance of cultivation. The land to the north is abrupt and mountainous ; to the south sandy and barren. The entrance to the bay is between bold and rocky shores, which confine the tide, and which flowing in, bore Captain Wilkes' ship onwards through a narrow passage into a large estuary, within which several islands and rocks are scattered. Some of the islands are covered with rich vegetation, others are barren, and covered with guano ; immense flocks of sea-fowls are perpetually hovering over, around, and alighting upon them. The shores of the bay recede north and south far beyond the visible horizon ; and there is comprehended within the magnificent view one of the most spacious and safest ports in the world.

YERBA BUENA is the usual but not the best anchorage. The town, as it is called, or rather the scattered buildings, consists of a large frame house, occupied by the agent of the Hudson Bay Company ; a store, kept by an American ; a billiard-room and bar ; a poop-cabin of a ship, occupied as a dwelling by an Anglo-American captain ; a blacksmith's shop, and some out-buildings. There is an old dilapidated *adobe*, conspicuous building, on the top of the hill overlooking the anchorage. Yerba Buena stands on a sterile soil, and in the

face of hills of bare rock. At low water an extensive mud-flat extends in front.

Captain Wilkes says, he found a total absence of all government in California, and even its forms and ceremonies thrown aside.

"After passing through the entrance of the bay," he observes, "we were scarcely able to distinguish the Presidio; and had it not been for its solitary flag-staff, we could not have ascertained its situation. From this staff no flag floated; the building was deserted, the walls had fallen to decay, the guns were dismounted, and every thing around it lay in quiet. We were not even saluted by the stentorian lungs of some soldier, so customary in Spanish places, even after all political power as well as military and civil rule has fled. I afterwards learned that the Presidio was still a garrison in name, and that it had not been wholly abandoned; but the remnant of the troops stationed there consisted of no more than an officer and one soldier. I was not able to learn the rank of the former, as he was absent, and appeared, at least among the foreigners, to be little known.

"At Yerba Buena there was a similar absence of all authority. The only officer was the alcalde, who dwells at the mission of Nostra Senora de los Dolores, some three miles off. He was full of self-importance, making up for what he wanted in the eyes of others, by a high estimate of his own dignity. I could find no one who could furnish me with his name, which must be my apology for not recording it in his place. Some excuse may be offered for his inattention to his duties, as I understood that he had just been united in wedlock to a lady of one of the distinguished families of the country; and after such an event in California, much gaiety and rejoicing usually follow, until the hilarity at times becomes so uproarious as to end in fighting and bloodshed."

Palermo mountain, called Table Hill by Captain Beechey, is about two thousand five hundred feet high, and wooded here and there with scraggy oaks. Between this mountain and the bay the hills recede, so as to form a sort of amphitheatre. This place was chosen for the observatory, and where the instruments had been set up under the direction of Lieutenant Carr. Captain Wilkes says—

"This place is well adapted for the resort of whalers. Here they may repair their boats, obtain water, and refit; and from their frequent resort to it, has obtained the name of Whalers' Harbour. The cove is a safe anchorage, being protected from the north-west and westerly winds, which prevail during the summer season, and often blow with great violence.

"At the time of our visit, the country altogether presented rather a singular appearance, owing, as I afterwards observed, to the withered vegetation and the ripened wild oats of the country. Instead of a lively green hue, it had generally a tint of a light straw-colour, showing an extreme want of moisture. The drought had continued for eleven months; the cattle were dying in the fields,

and the first view of California was not calculated to make a favourable impression either of its beauty or fertility."

The country, at the time of Captain Wilkes' visit, and for several years previous, had, he says, been in a state of revolution, and was involved in anarchy and confusion, without laws or security of person and property. "It is undergoing," he remarks, "such frequent changes, that it is difficult to understand or to describe them."

UPPER CALIFORNIA exhibits, inland, lofty ranges of mountains, narrow valleys, and extensive plains. A range of high land, from ten to twenty miles in breadth, extends along the Pacific from Cape Mendocino to latitude thirty-two degrees north.

The valley of San Juan, of no great extent, is situated between these hills and the *Sierra*, a low range of mountains. East of the *Sierra* is the valley of the Sacramento, from which, to the south, extends the valley of Buena Ventura as far as Mount San Bernardino, about the thirty-fourth parallel of latitude. East of this valley is the Californian range of mountains, being a continuation of the cascade range of Oregon; the southern summits are covered with snow. This range decreases in height until it declines into hills of moderate elevation. To the east of the Californian mountains are vast sandy, sterile plains. On the sea-coast range of hills the lands generally are unfit for agriculture, except in some vales of small extent. These hills are, however, well adapted for pasturage. They are covered with short sweet grass and wild oats, upon which deer and elk feed. The Valley of the Sacramento and that of San Juan are considered the most fertile districts of California. The Valley of San Juan is the garden of the country, and capable of producing wheat, Indian corn, rye, oats, &c., with all the fruits of the temperate and many of the tropical climates. It affords also excellent pasturage. This valley comprises a level plain from fifteen to twenty miles in width, extending north and south from the bay and mission of San Francisco. Several small streams and lakes water it, but in dry seasons the crops and herbage suffer extremely from drought, and the cattle are then also deprived of good pasture.

The *Sierra* affords little soil for cultivation, being rugged, barren, or sandy. It is in places, wooded with cedar, pine, and oak. The great Valley of Buena Ventura, the chief resort of the Californian Indians, is, by all accounts, far inferior to that of San Juan. It lies nearly parallel to the latter, and is watered by the San Joachim river and its branches.

This river receives numerous streams flowing from the Californian mountains. These near their base are wooded with oaks, to which succeeds the red California cedar (*Schubertia Abertina*), and still higher pines grow up to the region of perpetual snow. On the eastern side of this range there is but little timber, and in consequence of the want of moisture, trees do not flourish west of their lower

slopes. The inland plain, constituting a large part of Upper California, is, according to all accounts, an arid waste; the few rivers that exist rise periodically, and soon disappear in the sands.

Of the latter portion of country, however, there is little known, and the accounts given of it are greatly at variance with each other. Of seven persons who traversed it at different times, one declared that the horses and men had not only a scanty supply of water, but were actually nearly famished for want of food; while others stated they found both grass and water plentiful. Captain Wilkes remarks,—“The only thing that can reconcile these contradictory statements is, that these different persons had visited the country at different seasons of the year. It seems not at all improbable that the first of these accounts should be the correct one, for we find great aridity throughout the rest of California and Oregon also. All agree that the middle and most extensive portion of this country is destitute of the requisites for supplying the wants of man.”

CLIMATE.—“With California,” says Captain Wilkes, “is associated the idea of a fine climate and a rich and productive soil. This, at least, was the idea with which I entered its far-famed port; but I soon found, from the reports of the officers, after the trial they had had of it during the months of August and September, that their experience altogether contradicted the received opinion upon the first-mentioned point. Many of them compared its climate to that of Orange Harbour, at Cape Horn, with all its cold blustering winds and cloudy skies. This kind of weather prevails during the greater part of the year, and the comparison is literally true in relation to one portion of California—the sea-coast.”

The climate varies as much, if not even more, than the natural features and soil of the country. On the coast it has as high a mean temperature in winter as in summer. The latter is the coldest part of the year, owing to the constant prevalence of the north-west winds, which blow with the regularity of a monsoon, and are exceedingly cold, damp, and uncomfortable, rendering fire often necessary for comfort in midsummer. “This is, however, but seldom resorted to, and many persons have informed him that they have suffered more from cold at Monterey than in places of a much higher latitude. The climate thirty miles from the coast undergoes a great change, and in no part of the world is there to be found a finer or more equable one than in the Valley of San Juan. It more resembles that of Andalusia in Spain, than any other, and none can be more salubrious. The cold winds of the coast have become warmed, and have lost their force and violence, though they retain their freshness and purity. This district of country, about twenty miles long by twelve broad, is that in which the missions have been chiefly established; and the accounts of these have led many to believe that the whole of Upper California is well adapted for agriculture. The sandy barren highlands which separate the valley of San Juan from that of Buena Ventura, are about

1500 feet high. Pines grow along and over these heights, and the climate is exceedingly dry, though refreshed by the wind that blows against and over them." Beyond these highlands lies the central valley of Buena Ventura, which may be considered an extension of the Sacramento, and through which the river San Joachim flows. Being confined within mountains, summer heat is oppressive, the thermometer ranging, it is said, as high as within the torrid zone.

Although the Californian range is covered with snow, immediately above this valley it appears to have but little effect in modifying the temperature, which is represented as tropical throughout the year. This valley extends as far south as the San Bernardino Mountain. The residents in California say that they have never known the wind to blow from the north-east within thirty miles of the coast.

In ordinary seasons these valleys are well watered by the mountain streams; these are for some periods of the year mere brooks, while during the rainy season, from November to February, they often become impassable torrents. The Sacramento is the largest river in California. One of its branches, River Destruction, takes its rise near Mount Shaste, and was examined throughout the whole of its course by the party sent overland by Captain Wilkes, until it joined the Sacramento; the latter is thought by some to pass through the mountains and join Pitt's River. Pitt's River is said to take its rise to the north-east of the Shaste Mountain, and from the information that they received, extends as far as Pitt's Lake, under the forty-second parallel. Captain Wilkes doubts whether the length of its course is so great, and believes that the Sacramento has its source in the eastern spurs of the Shaste Mountain.

FEATHER RIVER is the principal stream between the American River and the source of the Sacramento. It flows into the latter below the Prairie Butés from the north-east. This branch takes its rise in the Californian Mountains, and has a course of about forty miles. The American River is a small branch that joins the Sacramento at New Helvetia. After receiving this stream, the Sacramento is joined by the San Joachim, which flows from the south, and below their confluence enters the Bay of San Pablo, through the Straits of Kaquines, and thence into the Bay of San Francisco.

The Sacramento is navigable for boats for about 150 miles, and for vessels as far as New Helvetia. The upper portion of it, near the Prairie Butés, overflows its banks, and often submerges the whole of the Sacramento Valley as far down as the San Joachim.

The San Joachim has its sources in the Californian range. The Tula Lake is called by the Indians Chintache Lake; it is for the most part separated from the channel of the river, but, when full, joins it.

There are many small streams that flow through the different valleys and afford partial opportunities for irrigating the land; but there are none of them navigable except the Sacramento.

BAY OF SAN FRANCISCO.—Upper California, according to Captain Wilkes, has one of the finest, if not the very best harbour in the world, that of San Francisco. Few are more extensive or could be as readily defended, while the fleets of all the naval powers of Europe and America might moor in it. This, he admits, is, however, the only really good harbour which the country possesses, for the others so called may be frequented only during the fine season, being no more than roadsteads, affording scarcely any shelter, and but few supplies to shipping.

MONTEREY is the capital of Upper California: the roadsteads Santa Barbara and San Pedro, are partly protected from the swell of the Pacific Ocean, by the islands. They are, however, but seldom resorted to, there being comparatively little trade along all this coast. Hides and tallow, which formerly abounded and rendered the intercourse profitable are not now to be procured.

The bay of Monterey is formed by Point Ano Nueva on the north, and Point Pinos on the south; it is twenty-four miles wide at its entrance, and six in length to the east; the east shore is low and sandy, and the surf of the Pacific rolls over the beach with a tremendous noise.

The Spanish galleons at Monterey anchor in six fathoms water, at two cables length from the shore, and moored to the beach. Ships putting in keep the south shore aboard, and after doubling the south point (Point Pinos), which stretches to the north, until they see the fort, and drop anchor in ten fathoms behind the point, where they are sheltered from the west winds—the south winds blow strongly off the shore. At full and change of the moon, it is high water here at half-past one; the tide rises seven feet.

Whales, a species of finner, have frequented the bay, and La Perouse says, that they came within half pistol-shot of the ship, and occasioned a disagreeable smell. The coasts of this bay are often covered with fogs, which render it dangerous to approach. Pelicans are said to frequent the sea at a short distance from land, and are a good sign for seamen, as they never go more than six leagues from shore. The Manilla galleons bore away for this place as a good harbour to recruit in, when driven to the north by contrary wind.

TRADE OF SAN FRANCISCO.—The breaking up of the missions, and the duties and prohibitions, have nearly destroyed the little trade that once existed. In this port a few hulks may be seen lying, furnished with every needful article: these keep up an illicit intercourse by the connivance of the officers of the government.

The principal articles imported are cotton, cloths, velvets, silks, brandies, wines, teas, &c., in return for which they receive hides and tallow, skins, wheat, and salmon. The attention of the inhabitants has been chiefly directed to the rearing of cattle, and the greater part of the wealth of California may be considered as consisting of live stock. The value of exports on the average of years is stated to be about 150,000 hides; and 200,000 arrobas of tallow. The price for the former has been about two dollars, while the latter was worth one dollar and fifty cents the

arroba. About two thousand beaver skins, valued at two dollars each, are brought to this market by the trappers, and from four to five hundred sea-otter skins are brought in by the American hunters, which are valued at thirty dollars each. *Wheat has been exported to the Russian posts* to the amount of 12,000 bushels, of which the average price has been about fifty cents a bushel. It has been as high, in 1841, as two dollars and fifty cents, in consequence of the great drought that prevailed. Among the animal exports may be enumerated about 3000 elk and deer skins, which are valued at from fifty cents to a dollar each. The whole exportable products of the country may be estimated at less than a million of dollars.

AGRICULTURE WITHIN THE CALIFORNIAN VALLEYS.—The wheat crops yield large returns. Capt. Wilkes was informed by Mr. Spears, of Yerba Buena, that he had delivered to an active American farmer thirty bushels of wheat for seed, at a time when it was difficult to procure it, under an agreement that he should have the refusal of the crop at the market-price. In July following, he delivered him 3000 bushels; and on its delivery he found that the farmer had reserved 600 bushels for himself, and this without estimating the loss from bad reaping and treading out with horses, would give 120 for one. This is not considered a fair criterion or average, as the land was remarkable for its richness, and was well attended to; but Mr. Spears, and several others, assured him, that the average would be as high as eighty bushels yielded for one planted.

Indian corn yields well, as also potatoes, beans, and peas. The cultivation of vegetables is increasing rapidly, and supplies in these latter articles may be had in abundance, and of the finest quality.

The country appears to be well adapted for grapes. Those that have been tried at the missions yield most abundantly, and about 200 casks, each of eighteen gallons, of brandy, and the same quantity of wine are made. The cultivation of the grape increases yearly, but is not sufficient for the supply of the country, as large quantities of foreign wines and liquors are imported, which pay an enormous duty. Captain Wilkes was informed by every intelligent person he met with, that the inhabitants of California consumed more spirits, in proportion to their number, than any other part of the world. Brandy sold for sixty to seventy dollars the cask, or four dollars a gallon, while the price of wine was only eighteen dollars. The wine of the country which he tasted was miserable stuff, and would scarcely be taken for the juice of the grape.

THE SALMON FISHERY is but little attended to. Captain Wilkes says the Californians never seem to attempt to catch salmon. The general opinion is, that they are too indolent to bestir themselves, and they naturally choose the employment which gives them the least trouble. Above every thing, the rearing of cattle requires the least labour in this country, for it is only necessary to provide keepers and have their cattle marked. This done, they can support themselves by the increase of the stock.

MANUFACTURES.—At the missions, the manufacture of various coarse articles had been undertaken by the missionaries as a step in the education of the Neophytes. Among these were blankets and wearing apparel, sufficient to supply all the Indians; but with the decline of these establishments the manufactures have in great part been discontinued. Soap of good quality is manufactured in considerable quantities, and it is thought that it might be exported at a profit, if the proper arrangements were made to use the grease which is now thrown away. The necessary alkali is very abundant. Leather of excellent quality is also made and well tanned, but in such small quantities as to be hardly sufficient to supply the wants of the country.

MILLS.—There are in California only two or three water-mills for grinding flour, and these are owned by foreigners. The mills in general use in the country are composed of no more than two burr-stones. To the upper stone a cross-beam is secured, to which mule-power is applied. In most of the *estancias* there is to be found a mill in an apartment adjoining the kitchen, if not in it. The whole is as primitive as well can be, although it is made to answer all the wants of an indolent people.

LIVE STOCK.—From all accounts, besides cattle, the country is adapted for the raising of sheep, which simply require watching, as they can find plenty of nutritious food the whole year round; but there has been no attention paid to this sort of stock, and the wool is of very ordinary quality. The mutton is said to be of very fine flavour. The usual price for a sheep is from one dollar and fifty cents to two dollars, when a choice is made for killing.

Hogs are raised in some parts, and might be fed to great advantage on the acorns which are abundant on the hills, where the land is not susceptible of cultivation. Pork may be salted and packed for three dollars the hundred weight. What adds to the facility of curing is the large quantities of salt which crystallize in the ponds in the dry season, and which may be obtained for the expense of carriage.

GENERAL TRADE OF CALIFORNIA.—Trade is so much interrupted, and so much under the influence of the governor and the officers of the customs, that those attempting to carry it on, under the forms usual elsewhere, would find it a ruinous pursuit. Foreign adventurers, however, contrive to evade customs laws, by keeping their vessels at anchor, and selling a large portion of their cargoes from on board. "Great partiality," according to Captain Wilkes, "is shown to those of them who have a full understanding with his excellency the governor; and from what he was given to understand, if this be not secured, the traders are liable to exactions and vexations without number. The enormous duties, often amounting to eighty per cent *ad valorem*, cause much dissatisfaction on the part of the consumers; the whole amount raised is about 200,000 dollars per annum, which is found barely sufficient to pay the

salaries of the officers and defray the costs of the government feasts, which are frequent, and usually cost a 1000 dollars each. These emoluments are shared among the heads of departments at *Monterey*, whilst the soldiers are often for months without their pay, and are made to take it in whatever currency it may suit the government to give. Besides the above duties there is a municipal tax on many things; thus, a dollar is demanded on every gallon of spirits imported; fifty cents on each beaver or otter skin, and on other articles in the same ratio. Next come the church tithes, which are enormous. I heard of a farmer who was made to pay 190 dollars as the tithe on his produce, although he lives far removed from either church or priest. All these things are bringing the government into great disrepute, and the governor is every day becoming more and more unpopular; so much so, that his orders have not been complied with, and have been treated with contempt, particularly when he desires to recruit his forces. A short time before our arrival he sent a list to a pueblo of the young men to be drafted as soldiers; when it was received they in a body refused to go, and sent back the disrespectful and defying message, that he might come and take them. Nothing can be more degraded than the lower functionaries, such as the *alcaldes* and their underlings. They are ignorant men, who have no ideas of justice, which is generally administered according to the *alcalde's* individual ideas or partiality. To recover a debt by legal means is considered beyond a possibility, and creditors have to wait until the debtor is disposed to pay." Captain Wilkes, however, qualifies this degraded administration, and observes: "Fortunately, and to the honour of the country, a just claim is rarely or never denied; and, until lately, the word of a Californian was sufficient to insure the payment of claims on him; but such has been the moral degradation to which the people have fallen since the missions have been robbed by the authorities, and the old priests driven out, that no reliance can be placed now upon their promises, and all those who have of late trusted them complain that engagements are not regarded, and that it is next to impossible to obtain any returns for goods that have been delivered. The state of the country is, however, some excuse, as it has been impossible for any one to make calculations under the existing anarchy and confusion."

"It was at first believed that the revolution which took place in November, 1836, would result in much immediate good to those who effected it, but such has not been the case. Foreigners unquestionably performed a large part in planning and carrying the change out; yet none have suffered so much by it as they have."

On the future prospects of California he remarks,—"The situation of Upper California will cause its separation from Mexico before many years. The country between it and Mexico can never be any thing but a barren waste, which precludes all intercourse except that by sea, always more or less interrupted by the course of the winds and the unhealthfulness of the lower or sea-port towns of

Mexico. *It is very probable that this country will become united with Oregon*, with which it will, perhaps, form a state that is destined to control the destinies of the Pacific. This *future state* is admirably situated to become a powerful maritime nation, with two of the finest ports in the world, that within the straits of Juan de Fuca, and San Francisco. These two regions have, in fact, within themselves, every thing to make them increase, and keep up an intercourse with the whole of Polynesia, as well as the countries of South America on the one side, and China, the Philippines, New Holland, and New Zealand, on the other. Among the latter, before many years, may be included Japan. Such various climates will furnish the materials for a beneficial interchange of products, and an intercourse that must, in time, become immense; while this western coast, enjoying a climate in many respects superior to any other in the Pacific, possessed, as it must be, by the Anglo-Norman race, and having none to enter into rivalry with it but the indolent inhabitants of warm climates, is evidently destined to fill a large space in the world's future history."

ABORIGINES OF CALIFORNIA AND THE MISSIONS.—The aborigines were first induced to adopt a change of religion either by the persuasion of the missionaries or by presents. Force was also resorted to as a last effort to bring them within the mission. The practice at that time was, that on being converted to Christianity, they were enforced to give ten years faithful service, after which period they were to be at liberty, and to have allotted to them a small piece of land for cultivation, and a few cattle, provided they could advance security for good behaviour. This was seldom realised; but their treatment was much more kind after the expiration of their term of service, and they usually remained in the employ of the missions, having become attached to their masters and to their occupations. They were, no doubt, kindly treated by the ecclesiastics, and their labour or duties consisted chiefly in taking care of cattle, labouring on the mission-farm, gardening, and household work. Some were taught to become carpenters and blacksmiths, others weavers, shoemakers, and manufacturers of leather; and some were let out to private service to "*gente de razon*," or the *people of reason*, as the whites are still termed in California. The police of the missions was strict, and punishment was administered when required. Rewards for good behaviour were also given, as well as for bringing in *Neophytes*.

During the revolts in 1836, the Indians of many of the missions were cast off, neglected, and deprived of the fruits of their labour. It was always impressed upon them by the *Spanish Padres* that they were interested in the property which had been accumulated by their labour, and this belief had naturally tended to attach them to the soil.

The ravages of the small-pox, two years prior to Captain Wilkes's visit, completed the destruction of these establishments, for it swept off one-half of the

aborigines and dispirited the rest, many of whom joined the wild tribes. He remarks, in 1841, they "are now committing acts of violence on the whites; they are becoming daily more daring, and have rendered a residence in single farm-houses, or *estancias*, not without danger. In looking at the state in which these poor Indians have been left, it cannot be denied but that they have cause to be dissatisfied with the treatment they have received."

Formerly each mission was considered as representing within its fold a distinct family of Indians, and consisting, in some missions, of about twelve hundred souls. During the authority of the Spanish priests, the administration of the missions was judiciously conducted: the aborigines were well clad, well fed, and lodged.

The *padres* purchased, in exchange for the products of Indian labour, annually ten thousand dollars' worth of articles from the vessels trading upon the coast. Each mission formed a kind of municipality of itself, having its *alcalde* and inferior officers. The Indians, who were at first disinclined to labour, became gradually industrious, as they enjoyed equitable advantages from the fruits of their own better-directed labour, on becoming converts to Christianity: at least so far as to observe and perform the ceremonial of the church. The forms and ceremonials of the church also allured the aborigines, and attached them to the missions, which increased in wealth by the industry of the greatly increased number of labourers, cultivating a rich soil in a genial climate.

In 1835 this happy state of the mission was revolutionised by one of the nominally republican, but in reality, military and despotic misgovernments which have afflicted the Mexican territories. *Administradors* were appointed to each mission, the priests were deprived of their municipal administration, and their duties limited to their clerical functions, with an allowance of a small stipend.

It is not contended that the private lives of the *padres* were generally either virtuous or free from profligacy; but with respect to the aborigines and the pecuniary prosperity of the missions, the latter have been plundered by the *administradors*, and the former have been, in many instances, dispersed, while the *padres* have not been able to bring in fresh *Neophytes*. During the visit of Captain Wilkes the *padres* of the mission of San José were, from want of substance, compelled to disperse five hundred of their proselytes to procure their subsistence. The *administradors* despoiled the missions as property acquired, only to be *re-invested* in the state; that is, in its rapacious officers for the time being. The rights of the poor aborigines were entirely overlooked; and when the latter brought away the cattle which justly belonged to them, they were severely punished. The injustice of being robbed of the fruits of their labour, and of witnessing others living upon the common stock of the missions, while the Indians were driven off to seek a precarious subsistence in the forests, naturally exasperated those who were brought up under these missions.

The consequence of such injustice was depredations committed by those Indians often with great success. Captain Wilkes observes, that "a month previous to the arrival of the squadron, they had driven off 300 horses. Retaliatory measures on the part of the Californians were adopted; a party was collected and despatched to punish them, which proceeded towards the interior, came to a village, and, without any inquiry whether its dwellers had been the aggressors, it was set on fire and reduced to ashes; some of the defenceless old men, who from their infirmities, could not escape, were put to death, and forty or fifty women and children carried off as prisoners. This was not all: these prisoners were apportioned as slaves to various families, with whom they still remain in servitude, and receive very harsh treatment. Smarting under such wrongs, it is not surprising that the Indians should retaliate. They openly assert, that after taking all the horses, they will commence with families; and many of those which are situated on the frontiers experience much alarm. In June, 1841, an Englishman was shot by an arrow at the door of his house, early in the evening. The Indians enticed him out by making a noise near by, and the moment he opened the door, with a candle in his hand, an arrow was sent through his heart."

The Indians at present rarely steal any property but horses; but so daring are they, that they not unfrequently take them out of the enclosures near the *pueblos*. Their reason for confining themselves to this description of property is, that with them they are able to avoid pursuit, which would not be the case if they stole cattle. The Californians, on detecting and apprehending the aggressors, show them no mercy, and their lives are made the forfeit. This constant foray on one side or the other, maintains an unceasing animosity; and as long as the present imbecile government lasts, there is not the least prospect of security or improvement.

To all strangers but those of the Spanish race, the Indians seem in general well disposed, as they have usually received from the former considerate and kind treatment. The character of these Indians is not represented as savage, and they were little disposed to harass the whites until they had been themselves ejected from the missions and forced to consort with those who are yet in a wild state. The knowledge they have of the Californians, of the missionary establishments, and the manner of conducting them, enables them to act effectively; and if it were not for the presence of the English and Americans, they would either drive the Spanish race out of the country, or confine them to the limits of their villages.

INDIAN POPULATION OF CALIFORNIA.—The number of Indians is variously stated at from 12,000 to 15,000; but it is believed by some of the best informed, that their number, since the small-pox made its ravages among them, is not much more than 8000 or 9000. The principal part of which consists of the tribes on the Sacramento.

POPULATION OF THE EUROPEAN RACE.—It is said that there has been an exaggeration in computing the number of the whites or “gente de razon.” These have been usually estimated at 5000; but, from the best information obtained by Captain Wilkes, he could not satisfy himself that they number more than 3000 souls. In this estimate is not included those of mixed blood, who may amount to 2000 more; so that the whole of Upper California at the date of his visit in 1841, the entire population was about 15,000 souls; which estimate he considered about correct.

The remarkably good health and robustness of the white inhabitants, he attributed to the “fine climate, as well as to their simple diet.” This consists of beef roasted upon wood coals, a few vegetables, and the tortillia. Throughout the country, both with the rich and poor, this is the general fare; but some few luxuries have been lately introduced, among which are rice and tea. The latter is used so sparingly, that the discolouration of the water is scarcely perceptible. At the missions, they live more after the Spanish fashion. The children are, for the most part, left to take care of themselves, and run about naked and dirty. They are generally robust, and their relative number seems to be very great; thus, it is by no means uncommon to see families of fourteen or fifteen children; and an instance was mentioned, of a woman near *Yerba Buena*, who had had twenty-six.

A large number die from accidental falls from horses, which, from almost their childhood, they are accustomed to ride. They soon become expert and fearless riders, and this acquirement is not confined to the male sex; the women are almost equally expert.

Although the Californians are comparatively few in number, they retain a distinctive character. Descended from the old Spaniards, they inherit all their vices, with a few of their virtues. Both sexes are addicted to gambling with cards, dice, &c.

Among their other amusements are cock-fighting, bull and bear-baiting, and dancing, accompanied with excessive drinking. Parties of amusement, to which the surrounding population is invited, are frequent; these generally last for three days, and rarely break up without some quarrel. Weddings are particularly liable to these disorders, and at each of the three last that took place at and in the vicinity of *Yerba Buena*, previous to Captain Wilkes’s visit there, a life was lost by the *cuchillo*. This weapon, which is always worn, is promptly resorted to in all their quarrels.

The female portion of the community are described by the same authority as “ignorant, degraded, and the slaves of their husbands. They are very fond of dress, and will make any sacrifice, even their own honour, to gratify it. The men have no trades, and depend for every thing upon the Indians at the missions, some of whom are ingenious, both as carpenters and blacksmiths. The whites are so indolent, and so proud, as to make them look upon all manual labour as

degrading; regarding all those who work as beneath them; they, in consequence, can never be induced to labour."

The state of morals he describes as very low, and every day as becoming worse. During the residence of the old Spanish priests, the people were kept under some control; but, since the change, priests and laymen are alike given up to idleness and debauchery. They are, however, remarkable for their hospitality. It is alleged that they will give up all business to entertain a guest. They put no value whatever upon time, and on entering into contracts they have no regard to punctuality, frequently allowing two, three, and four years to pass by before payment. This does not proceed from dishonesty, or any intention to evade their debts, for eventually they pay, if they can, and do not object to the amount of interest. They, in fact, regard the inconvenience to which they may have put their creditors as of no sort of consequence.

Captain Wilkes was informed, that to offer money for entertainment was considered as an insult. He did so, and it was refused; yet when he offered it through his servant, it was readily accepted. He says further, "While one is entertained by them, if he should want to hire or purchase any thing, the landlord will league with those about him in schemes of extortion to be practised upon the stranger, and appear vexed with those who are the prominent extortioners."

The Californians, as a people, he says, must be termed cruel in their treatment to their wives, as well as to the Indians; and in a still greater degree, of course, to their slaves and cattle. They are exceedingly ignorant of every thing but extortion, riding horses, and catching bullocks.

CHAPTER XV.

EXPEDITION TO EXPLORE THE BAY OF SAN-FRANCISCO, AND UPPER COUNTRY.

ON the 20th of August, Lieutenant-Commandant Ringgold left the United States' ship of war, *Vincennes*, Captain Wilkes (lying in the bay of San Francisco), with six boats, accompanied by Dr. Pickering, Lieutenants Alden and Budd, Passed-Midshipman Sandford, Midshipmen Hammersley and Elliott, and Gunner Williamson, with provision for thirty days, accompanied by an Indian pilot. They first passed the islands of *Angelos* and *Molute*, next the points of San Pedro and San Pablo, and then entered the bay of San Pablo.

This bay is of a form nearly circular, and ten miles in diameter; many small streams flowed into it, fresh from the neighbouring hills. On the east side of this bay, the river Sacramento empties into it through the Straits of Kaquines. The land is high, and the sandstone rock on each side of the straits resembles that observed about the Straits of De Fuca. The hills are described as "thickly covered with wild oats, which were ripe, and the landscape had a peculiar golden hue. The contrast of this with the dark green foliage of the scattered oaks,

heightened the effect, which, although peculiar, is not displeasing to the sight. The trees all have an inclination towards the south-east, showing the prevalence and the violence of the bleak north-west winds, producing on them a gnarled and mountain character. This feature is general throughout the coast of California, and gives the trees a singular appearance, the flat tops having the air of being cut or trimmed after the manner of box-trees. The tops are bent to one side, and the larger branches hidden by the numerous twigs which compose the mass. The only place where a similar character was observed by us impressed upon the foliage, was at Terra del Fuego."

After passing the straits, the delta of the Sacramento opened to view. The Tula marshes, which are overflowed by the river above, are very extensive, and are said to be the resort of a vast number of beavers, which, in consequence of the nature of the ground, are difficult to catch, many more traps being necessary than in other localities. They then proceeded up the Sacramento to the American river falling into it, where a native of Switzerland has formed an establishment.

NEW HELVETIA.—Captain Suter, the founder, is a Swiss by birth, and informed Commandant Ringgold that he had been a lieutenant in the Swiss guards during the time of Charles X. Soon after the revolution of July, he came to the United States, and passed several years in the state of Missouri. He has but recently removed to California, where he has obtained from the government a conditional grant of thirty leagues square, bounded by the Sacramento on the west, and extending as far up the river as the Prairie Butes. The spot he has chosen for the erection of his dwelling and fortification, he has called New Helvetia; it is situated on the summit of a small knoll rising from the level prairie, two miles from the east bank of the Sacramento, and fifty miles from its mouth. New Helvetia is bounded on the north by the American Fork, a small serpentine stream, which has a course of but a few miles. This river, having a bar near its mouth, no vessels larger than boats can enter it. At this place the Sacramento is 800 feet wide, and this may be termed the head of its navigation during the dry season, or the stage of low water.

Mr. Geiger, a young American from Newport, was attached to Captain Suter's establishment; but he informed Captain Wilkes that he intended to settle higher up the Sacramento, on the banks of the Feather River. When Captain Suter first settled here in 1839, he was surrounded by some of the most hostile tribes of Indians on the river; but, by his energy and management, with the aid of a small party of trappers, has prevented opposition to his plans.

Although Captain Suter is, in general, in the habit of treating the Indians with kindness, yet he related to Lieutenant Ringgold and his party instances in which he had been obliged to *fusillade* nine of them; indeed, he did not seem to stand upon much ceremony with those who opposed him in any way. His buildings consist of extensive *currals* and dwelling-houses for himself and people, all built

of *adobes* (unburnt bricks). Labour is paid for in goods. His stock then amounted to about 1000 horses, 2500 cattle, and about 1000 sheep, many of which were seen in flocks around his premises, giving the place an appearance of peaceful civilisation.

Captain Fremont, who proceeded as far as New Helvetia three years after Captain Wilkes's visit, observes:—

“Captain Suter who, in 1838-9, formed the first settlement in the valley, on a large grant of land which he obtained from the Mexican government, had at first some trouble with the Indians, but by the occasional exercise of well-timed authority, he has succeeded in converting them into a peaceable and industrious people. The ditches around his extensive wheat-field—the making of the sun-dried bricks, of which his fort is constructed—the ploughing, harrowing, and other agricultural operations, are entirely the work of these Indians, for which they receive a very moderate compensation, principally in shirts, blankets, and other articles of clothing. In the same manner, on application to the chief of a village, he readily obtains as many boys and girls as he has any use for: there were at this time a number of girls at the fort in training for a future woollen factory, but they were now all busily engaged in constantly watering the gardens, which the unfavourable dryness of the season rendered necessary. The occasional dryness of some seasons, I understood, to be the only complaint of the settlers in this fertile valley, as it sometimes renders the crops uncertain. Mr. Suter was about making arrangements to irrigate his lands by means of the Rio de los Americanos. He had this year sown, and altogether by Indian labour, 300 fanegas of wheat.

“A few years since, the neighbouring Russian establishment of Ross being about to withdraw from the country, sold to him a large number of stock, with agricultural and other stores, with a number of pieces of artillery and other munitions of war; for these a regular yearly payment is made in grain.

“The fort is a quadrangular *adobe* structure, mounting twelve pieces of artillery (two of them brass), and capable of admitting a garrison of a thousand men; this at present consists of forty Indians, in uniform, one of whom was always found on duty at the gate. As might naturally be expected, the pieces are not in very good order. The whites in the employment of Captain Suter—American, French, and German—amount, perhaps, to thirty men. The inner wall is formed into buildings, comprising the common quarters, with blacksmith's and other workshops; the dwelling-house, with a large distillery-house and other buildings, occupying more the centre of the area.

“It is built upon a pond-like stream, at times a running creek, communicating with the Rio de los Americanos, which enters the Sacramento about two miles below; the latter is here a noble river, about 300 yards broad, deep and tranquil, with several fathoms of water in the channel, and its banks continuously timbered.

There were two vessels belonging to Captain Suter at anchor near the landing—one a large two-masted lighter, and the other a schooner, which was shortly to proceed on a voyage to Fort Vancouver for a cargo of goods.

“Since his arrival, several other persons, principally Americans, have established themselves in the valley. Mr. Sinclair, from whom I experienced much kindness during my stay, is settled a few miles distant, on the Rio de los Americanos. Mr. Coudrois, a gentleman from Germany, has established himself on Feather River, and is associated with Captain Suter in agricultural pursuits. Some settlers also from the Columbia River had arrived. Among other improvements, they are about to introduce the cultivation of rape-seed (*brassica rapus*), which there is every reason to believe is admirably adapted to the climate and soil. The lowest average produce of wheat, as far as we can at present know, is thirty-five fanegas for one sown; but as an instance of its fertility, it may be mentioned that Senor Valejo obtained, on a piece of ground where sheep had been pastured, 800 fanegas for eight sown. The produce being different in various places, a very correct idea cannot be formed.”

Captain Suter, who had engaged in extensive agricultural operations, had, in the year of Captain Wilkes's visit, all his crops ruined by the drought. He had taught the Indians to make *adobes*. The agreement for their services were usually made with their chiefs, and in this way as many as he wanted were readily obtained. The chiefs had far more authority over their tribes than those which Captain Wilkes had seen to the north, and appeared to have more authority over, and were more respected by their tribes, than those of any other of the North American Indians. Connected with his establishment Captain Suter had erected a distillery, in which he made a kind of spirit from the wild grape of the country.

To all the foregoing enterprises, Captain Wilkes says:—

“That Suter added the *direction* of a large party of trappers and hunters, mostly Americans, who enter here into competition with those of the Hudson Bay Company; and attended also the Russian establishment at Ross and Bodega, which had just been transferred to him for the consideration of 30,000 dollars. In the purchase were included all the stock, houses, arms, utensils, and cattle, belonging to the establishment. It was understood that this post was abandoned, by orders of the Russian government, the Russian company no longer having any necessity to hold it to procure supplies, as they are now to be furnished under a contract with the Hudson Bay Company; and, by giving it up, they avoid many heavy expenses.”

BODEGA.—The trading post at this place was first established by the Russians in 1812, under a permission from the then governor of Monterey, to erect a few small huts for salting their beef. A small number of men were left to superintend this business, which in a few years increased, until the place became of

such importance in the eyes of the Spanish authorities, that on the Russians attempting to establish themselves at San Francisco, on the island of Yerba Buena, and to employ their men in trapping during the season, they were ordered to leave the country. This they refused to do, and having become too strong to be removed by the Spanish force, the post had been suffered to remain undisturbed until the time of Captain Wilkes's visit.

The PORT OF BODEGA is situated about ninety miles to the north of that of San Francisco, and being both inconvenient and small, cannot be entered except by vessels of a small draft of water. Captain Wilkes says, "From what I understood from the officers who had been in charge of it, it had been a very considerable expense to the Russian American Company to fortify it, and the disposal of the whole, on almost any terms must have been advantageous. Captain Suter had commenced removing the stock and transporting the guns, &c., to his establishment."

The building at the two posts numbered from fifty to sixty, and they frequently contained a population of 400 or 500 souls. Since the breaking up of the establishment, the majority of the Russians returned to Sitka; the rest have remained in the employ of the present owner.

Although the country around New Helvetia was parched up with the severe drought that had prevailed before the arrival of Captain Wilkes, yet the short grasses were abundant, and it was more completely covered with vegetation than that below. Scattered oaks grew in all directions, some of which were of large dimensions—five or six feet in diameter, and sixty or seventy feet high.

The scenery was very much admired, and Mount Diavolo, near the mouth of the San Joachim, adds to its beauty. The mountains to the east are visible from Captain Suter's settlement, and it is said that during some portions of the year they are covered with snow. A route across them was followed, directly east of this place, by a party, but they were twenty days in getting over, and found the country so thickly wooded that they were obliged to cut their way. The pass which is recommended as the best, is 200 miles to the north of this place, through the gap made by the head waters of the Sacramento. This has led to the belief that Pitt's River extends in this direction through and beyond them.

ROUTE FROM SAN FRANCISCO TO THE UNITED STATES.

The best route from San Francisco to the United States, as laid down by Captain Wilkes, is to follow the San Joachim for sixty miles, thence easterly, through a gap in the snowy mountains by a good beaten road; thence the course is north-easterly to *Mary's River*, which flows south-east, and has no outlet, but loses itself in a lake; thence continuing in the same direction, the Portneuf River in the Upper *Shoshone*,

is reached; and thence to *Fort Hall*, according to Dr. Marsh (an American of much intelligence, resident at the mouth of the San Joachim, to whom Captain Wilkes says, "we are indebted for much information of the country"), there is plenty of fresh water and pasturage all the way, and no proper desert between the Californian range and the Colorado. See hereafter "Captain Fremont's Journey from Fort Hall to the Columbia."

Dr. Marsh crossed nothing like a range of mountains in the whole route from the United States. Hills and mountains were often seen on what he calls the table land of New Mexico. The most common plant met with was an acacia, a small shrub which is also to be found in the southern parts of New Mexico, where the climate is likewise very arid. In one district where it occurs, it is found necessary to protect both horse and rider with a sort of armour against this rigid and thorny vegetation, between latitude 37 deg. and 38 deg. north. He also reports that there are other streams to the east of the mountains without outlets, and which do not reach the Colorado, although running in that direction. He identifies the *Youta*, or Great Salt Lake, with the *Lake Temponogos* of the early Spanish fathers who visited it, and agrees with others in placing the north end of it nearly in the parallel of 42 deg. north. See also "Captain Fremont's Journey."

THE COLORADO OF THE WEST he reports to be impracticable for boats to descend from the head waters to its mouth, on account of its rapidity. There is one place in it that is described as similar to the *Dalles* of the Columbia, which is supposed to be where it passes through the range of mountains.

EXPEDITION UP THE SACRAMENTO.—Captain Wilkes sent a boat, with an officer on board to explore the Sacramento upwards. They found the banks of the river bordered with marshes which extend for miles back. This kind of country continues up both the Sacramento and San Joachim, and is the proper *Tula* district, of which so much has been said and so many errors propagated. Here the *Tula* (*scirpus lacustris*) grows in great luxuriance.

On the 26th, they reached the mouth of Feather River, which is fifteen miles above New Helvetia. It appeared nearly as broad as the main stream, but there is a bar extending the whole distance across it, on which the boats grounded. On the point of the fort, the ground was strewn with the skulls and bones of an Indian tribe, all of whom are said to have died within a few years of the tertian fever, and to have nearly become extinct in consequence. Near this had been an Indian village, which was destroyed by Captain Suter and his trappers, because its inhabitants had stolen cattle, &c. The affair resulted in one of the Indians being killed, twenty-seven made captive, and the removal of the remainder beyond the limits of his territory. The battle-ground was pointed out, at a bend of the river, which is only one-third of a mile across, though three around.

Game is represented to have decreased in this vicinity, from the numbers destroyed by the parties of the Hudson Bay Company who annually frequent these grounds. (See account by Captain Fremont, of "The Destruction of Buffalo," &c.) Large flocks of curlew were seen, and the California quail, which disappeared since leaving the coast, was again observed. The trees that line the banks consist of the cotton-wood, &c. Single oaks, with short grass beneath them, are scattered over the plain.

The next day, as they advanced, game became more plentiful, and elk were found to be most so. Some of them were of large size, and at that season of the year, the rutting, they are seen generally in pairs, but at other times the females appear in large distinct herds. They were fine-looking animals, with very large antlers, and in the first instance, devoid of fear. The herds were usually thirty or forty in number, and chiefly composed of females and their young. The father of the flock is always conspicuous, and with his horns seemed to overshadow and protect the family.

The tula, or bulrush, was found in great quantities, growing on the banks. The Indians use its roots as food, either raw or mixed with the grass seed, which forms the principal article of their food. This root is likewise eaten by the grisly bear.

The party encamped in the ruins near a grove of poplars of large size, some of which were seventy feet high, and two and a half feet in diameter. The leaf resembled that of the American aspen. At night they had a slight thunder shower. The wolves and bears had entered the camp during the night, although there was a watch kept at each end of it. The howling of the wolves was almost constant.

On the 27th, the current of the Sacramento had become much more rapid, and the snags more frequent. The banks were on an average about twenty feet above the water, though there was every appearance of their having been overflowed. The prairies were perfectly level, and everywhere overspread with the shells of the Planorbis. In some places these shells appeared as though they had been collected in heaps. From the top of these banks the prairie Butes were in sight to the northward and westward.

As they proceeded up the river, the country continued of the same character, the level being only interrupted by trees that bordered the river. These consisted of oaks and sycamores.

Game and fur bearing animals had become more numerous, and among them were the lynx and fox. The latter is the species whose fur brings a high price in China, where, as much as twenty dollars is paid for a skin. This fox is said to have one peculiarity, namely, that when chased it will ascend trees. Bears were also seen in great numbers.

Dr. Marsh thinks there is but one species, the grisly bear; but the black bear

of the United States is found in New Mexico, and highly prized for its skin: though Dr. Pickering thinks he saw another species, whose summer coat approaches the yellow bear of Oregon. The skin of the young is here sometimes made into quivers, and they are destitute of the horny claws of the grisly bear. The skin of the later animal is said sometimes to be as large as that of an ox; its food is the same as that of the Indians, and varies with the seasons. Its strength is said to be prodigiously great, and it has been known, when lassoed, to drag three horses; and, when baited in the bull and bear-fights, practised in California, will check the charge of a bull by stretching out one of its paws. They will also ascend the oaks for the acorns, and break off branches so large as almost to ruin the tree. It does not, at all times, kill its enemies when it has them in its power; rarely attacks a man unless he comes upon him by surprise, and is not considered a dangerous animal.

The vegetation throughout the whole course of the Sacramento showed evident traces of salt, and in some places the prairies seemed to be incrustated with it.

On the 4th, the expedition returned to New Helvetia, where they found that a small Russian schooner had arrived from Bodega, bringing the governor of that establishment, who was about delivering it up to Captain Suter. The vessel was understood to have been built at Sitka, and was of only thirty tons' burden, very much resembling an English vessel of the same class.

For a boat they use a skin "Badaka," that is admirably adapted for the seas and weather they have to contend with. When the persons are seated, and the opening closed, with a skin dress they more resemble an aquatic animal than any thing else.

The morning after their arrival, Captain Suter paid his men their weekly wages, in cloths, calicoes, vests, shirts, and pantaloons. The whole was arranged through their chief, who spoke a little Spanish. The labourers are obtained from the different *rancherias*, and some from the vicinity of the mountains. It was observed that the larger portion of the labourers were young men and boys; no women were employed, and as yet their services are not needed; but it is the captain's intention, as he informed our gentlemen, to have employment for them in a year or two.

Captain Wilkes says, "Several Americans from the United States were then (1841,) beginning to settle in this part of the country, and it will not be long before it becomes, in some respects, an American colony. Although it was late in the season, a few salmon were caught at the fishery; they were not to be distinguished from the Columbia species of the first run.

"The Indians have several *rancherias* around New Helvetia. Their lodges are all somewhat like low haystacks, being composed of a framework of sticks thatched with the bulrush.

"In the preparation of the acorn bread all assist. The acorns are gathered in

very large quantities, piled in heaps, and spread in the sun to dry. Both men and women are to be seen employed shelling, pounding, and baking them into bread: the pounding is performed upon a plank that has been hollowed out with a stone pestle; to reduce the large quantity to a fine powder, requires great labour."

Captain Wilkes continues to observe, "Around New Helvetia, although but a few days had elapsed since their former visit, the country, if possible, appeared more arid; it by no means justified the high encomiums that we had heard bestowed upon this far-famed valley. Our expectations, probably, had been so much raised as scarcely to allow us to give it that credit it really deserves."

"The valley of the Sacramento may include a space of 180 miles long, by from twenty to fifty miles wide. A large part of this is undoubtedly barren and unproductive, and must for ever remain so. The part that is deemed good soil, is inundated annually, not for any great length of time, yet sufficiently long to make it unfit for advantageous settlement. The high prairie is spoken of as being in general barren, and as affording but little good pasture.

"The crops are usually ripe in June, which enables the wheat and Indian corn to be gathered before the summer drought begins. There is usually a rainy season of three months, but during the year of our visit no rain had fallen; and from every crop having failed, the inhabitants had been living upon their cattle. The cattle suffered almost as much as the crops, and large numbers of them died from starvation. On this account the inhabitants had forborne to kill their cattle for hides, believing it to be a great loss to do so, as the weight was so much depreciated as to pay little more than the labour of slaughter and preparing for market.

"The variety of game in this country almost exceeds belief. The elk may be said to predominate, but there are also many bears, black-tailed deer, wolves, foxes, minxes, hares, musk-rats, badgers, antelopes, and *ovis montana*. The wolf is reported by Dr. Marsh to be the same as the prairie wolf of the Upper Mississippi, but not the one described by Say. The fox is the same as the gray one of the wooded parts of the United States. According to Mr. Peale, the black-tailed deer is the only species found in this country. The *ovis montana* has been frequently seen by Dr. Marsh; its coating is altogether hair, without any admixture of wool. No specimens were obtained for the expedition.

CHAPTER XVI.

ESTABLISHMENTS ON THE WEST AND SOUTH OF THE BAY OF SAN FRANCISCO.

On the west side of the Bay of San Pablo, are some of the finest tracts of country in California. One of these is called the Valley of Nappa, another

that of Zonoma, and a third San Rafael. In Zonoma is situated the town of the same name, the residence of General Vallejo, and the mission of San Rafael. The fertile country extends across to Ross and Bodega, the two Russian settlements before spoken of."

ZONOMA is the seat of government, and is situated in an extensive plain, with some high hills for its southern boundary. The plain is covered with fine oaks, and there is a never-failing stream of water passing through it. There is besides an inlet from the bay, which allows a boat navigation to it of about twelve miles.

Zonoma contained only the following buildings: "the general's house, built of *adobes*, of two stories, which fronts on the public square, and is said to be one of the best houses in California. On the right of this is the residence of the general's brother, Salvadore, and to the left, the barracks for the accommodation of the guard for the general, consisting of about twenty fusileers. Not far removed is the old dilapidated mission-house of San Francisco Solano, scarcely tenatable, though a small part of it is inhabited still by a padre, who continues, notwithstanding the poverty of his mission, to entertain the stranger, and show him all the hospitality he can."

The anecdotes related to Captain Wilkes of the general commanding, all showed a disregard for the lives, as well as for the property and liberty of the Indians, and "*Gente de razon*." This general acted with the same impunity as all his predecessors, with one or two exceptions, have done before him. As an instance of the lawless acts of the governors, it is said that one of them entertained the idea of training the Indians as soldiers, and a company of them which had been drilled made such proficiency in the use of their arms, that his excellency became alarmed, and forthwith ordered them all to be shot! Captain Wilkes had little doubt that this story might be true, for the value of an Indian's life in the eye of these rulers, scarcely exceeds that of one of the wild cattle. The commandant-general is frequently said to hunt them, and by his prowess in these expeditions has gained some reputation.

Salvadore Vallejo, the general's brother, was engaged in agricultural pursuits, and particularly in raising cattle, "which," says Captain Wilkes, "under the governor, he has the special privilege of supplying to vessels, which he does at prices that insure a handsome profit. In times of scarcity, vessels are sure to be supplied by applying to the governor, who will order supplies to be furnished, and even obtain them by compulsion. On my arrival, finding that we wanted supplies, and not knowing how long (in the event of an accident to our land party) I might be detained, I was advised to apply to the commandant-general, through whom I would be sure of obtaining them. I therefore despatched a note by an officer, whom the general treated with great politeness, and returned for answer, that he could supply me with the following articles:—Lima beans, wheat, potatoes, and other vegetables, which we had been unable to obtain. Fortunately for us, as well as for the lower orders and Indians, the party arrived,

and we were not under the necessity of making use of his powerful intervention. The general, I was told, considers every bushel of grain as much at his command as he does the persons of the people, and the property of the state. Zonoma is to be the capital of this country, provided the general has power and lives long enough to build it up. An idea has got abroad that he is looking to the *gubernatorial* chair, and to be placed there by the same force that has raised Alvarado and himself to the posts they now occupy."

Zonoma is on the road that leads to Ross and Bodega, and by this route Captain Suter had transported all the stock he purchased of the Russians.

The state of society here was found, by Captain Wilkes, "to be exceedingly loose; envy, hatred, and malice, predominated in almost every breast, and the people were wretched under their present rulers;" "Female virtue," he regrets to say, "is also at a low ebb; and the coarse and lascivious dances, which meet the plaudits of the lookers-on, show the degraded tone of manners that exists."

The mission of San Rafael is situated in a fertile valley about twelve miles from Sansalito. It at present consists of a large building with a small chapel attached; both in a tolerable state of preservation, and under the superintendence of an Irishman, who has been appointed to the charge from its being considered a place of emolument, through his interest with the governor. A padre resides at this mission for six months of the year, and officiates as priest.

On the 24th of October, during Captain Wilkes's visit, a *fête* was given at this place, in honour of the patron saint; and it was rumoured that there was to be a grand bull-fight. The latter was miserably conducted. "The bulls had greatly the advantage, and the men and horses were tumbled about until both became quite shy. They had cut off the tips of the bull's horns, which was a fortunate circumstance for both horses and riders, who received no material injury. There was no bull and bear-fight, in consequence of their not being able to procure one of the latter animals. In the fights between the bull and bear, it is said, that however strong and savage the bull may be, the bear is always the conqueror: the only part of the bull he endeavours to attack is the tongue, by seizing which he invariably proves the victor.

"When the fights were over, dancing was resorted to, and continued during the evening and all night. It was accompanied with hard drinking and uproarious conduct. Mr. Murphy's entertainment was considered fully equal to any that had been given for some time, and particularly the latter part of it."

In order to ascertain the condition of the missions at the south end of the bay, Captains Wilkes and Hudson left the Vincennes at St. Francisco, on the morning of the 29th, and stopped a short time at Yerba Buena for a guide to point out the passages through the shoals, and the entrance to the creek that leads up to the *Embarcadero*, or lading place, whence the people of the mission usually ship their hides.

In consequence of the incapacity of the pilot, their boat grounded, and they were detained so long, that night overtook them before they entered the river Caravallio, which runs in a tortuous direction to the *Embarcadero*. It was so narrow that they were compelled to haul the boat along by the grass and rushes on each side, and as they passed along at night, the water-fowl were, while sleeping on the water among the rushes, alarmed by the noise, and flew up in thousands from the marshes. The noise of their fluttering resembled that of the surf of the sea; and as they rose thousands seemed to follow thousands until the sound died away in the distance, and again seemed to approach in an opposite direction, while in the darkness not a bird was to be seen, although they must have passed only within a few feet of the boat.

"At the *Embarcadero*," says Captain Wilkes, "we found no house or accommodation of any kind; but the guide soon led us to what he termed the road, which was found marked by the huge ruts made by the ox-carts.

"After proceeding a mile over a level plain, they reached the *estrancia*, the out-works of which was a broken *coural*, with the ground covered with the bones, hoofs, and horns of cattle.

"They were greeted by the sudden appearance of a huge Californian, more than six feet in height, and proportionately large, who stalked towards them in his shirt, and in a gruff tone he demanded their wants. Having received satisfactory explanations, with a cigar given him as a token of friendship, he called up the whole family, which consisted of a mother, two daughters, and several other children. "These," says Captain Wilkes, "after dressing themselves, came forth, and greeted us with genuine hospitality, with such pleasant faces and cheerful talk, that it was really delightful to find ourselves in such quarters. They immediately set about providing us with supper, consisting of tea, tortillias, valdivias, ollas, with eggs and a steak; and while this was in preparation by some, others were arranging the beds, and changing the furniture of the sleeping-room. All this was done while the mother was talking and waiting upon us; and, after supper was over, she pointed to our room, and then excused herself, by saying she must provide something for the sailors who had accompanied us; whilst we retired to rest much fatigued with our jaunt. We arose about eight o'clock, and consequently missed our chocolate, which is given at an earlier hour, and could get no breakfast until eleven o'clock.

"While horses were sought for us, we spent the time in looking around the premises. The house was a long one-story *adobe* building, with a thickly thatched roof, forming, by its projection, a piazza in front, supported by columns. There were many enclosures about the house that gave it the appearance of a farm-yard and slaughter-house combined. Bones, hoofs, horns, and pieces of hide, were lying in every direction, and the ground was indented with the feet of cattle. Ducks, dogs, and fowls were picking at the bones and offal. There were one or two ox-carts, of clumsy proportions, a beehive and a ley-vat, formed of hide and

suspended to four stakes, in the shape of a large bag hung near by. At a short distance from the house was the vegetable garden, where every thing grew in profusion, although without care. The only trouble in gardening was to put the seed into the ground, and await the result. This *estancia* is situated between two copses of wood, that grow on the banks of the brook that winds past it, and nearly join in the rear. In front is a plain extending fifteen or twenty miles to the foot of the *Sierra*, which forms a pleasing and bold contrast to the flat surface, on which nothing is seen but here and there a small group of cattle, and immense flocks of wild geese on some shrub, which, owing to the refraction, appears almost detached from the surface, and with dimensions so much enlarged as to appear like a great tree. The plain at this time was of a dark hue, somewhat resembling a light bronze colour, in consequence of the vegetation having been scorched up for many months."

The mission of Santa Clara, which they visited, though it had, at a distance, a respectable appearance, consisted merely of a long line of huts, formerly occupied by the Indians. The church and mission-house adjoining, were in a dilapidated state. The mission-house was then occupied both by the administrador and the *padre*; a wall dividing the temporal from the spiritual concerns of the establishment. In the rear of the mission, there is a quadrangle of low sheds, in which the domestic manufacture of candles, preserves, baking, and a variety of other duties are performed.

The garden was surrounded by a high adobe wall, and its gate is always kept locked. It was from one and a half to two acres in extent, and planted with vines. Grapes are cultivated without trellises; the grapes were generally of the sweet Malaga kind. The mission claims the first picking to make their wine and preserves. The inhabitants, the women of the "*gente de razon*," pluck afterwards, and then the children are allowed to gather the remainder. In this garden they also grow fruit of all kinds, both of the tropical and temperate climate, which they represented as succeeding admirably well. A few barrels of wine are annually made, but nothing can be more rude than the process of preparation. The tillage is performed with ploughs formed of a crooked piece of timber four to six inches square, which is merely used to loosen the ground to a depth of three or four inches; yet such is the fertility of the soil, and level nature of the land, that the crops yield an average of from sixty to eighty for one sown. The ploughs are drawn by oxen, and managed by the Indians.

At the missions throughout the country, four meals are daily taken: at an early hour, chocolate; at eleven o'clock, breakfast; at two, dinner; and at seven, supper. The dinner and supper are the principal meals, and at them the Californians are described as indulging to the extent of gluttony.

"After some difficulty in procuring horses," Captain Wilkes says, "we set out on sorry nags, and on leaving the mission entered an avenue lined on each side with large trees. These I understood had been planted at an early day by one of the padres, in order to protect the people from the sun during the celebration of the church festivals, and to leave no excuse to the inhabitants of the Pueblo for not visiting the mission-church. Just before arriving at the Pueblo, we crossed over one of the tortuous branches of the Rio Guadalupe, some twenty feet wide, and had a view of the Pueblo. It seemed as if this were a gala day, and as if every one were abroad celebrating it on the banks of this river, or rather creek, the overflowing of which had served to keep the grass green for a considerable space around. Instead of its being a festival, it turned out to be a general washing-day of the village, and the long lines, trees, bushes, &c., were all hung with the many coloured garments, which, with the crowds of men, women, and children, and some cattle moving to and fro, or gathered in small groups, gave the whole quite a pleasing effect. I was told that the Pueblo of San Jose had a larger number of inhabitants than any other in Upper California; but as we rode into it, it seemed almost deserted.

"The alcalde who gave the party a cordial reception, made his appearance like a French pastry-cook, with his white cap and apron. He was a short, dapper, rosy-cheeked man, by birth a Frenchman, but had been now twenty years settled in the Pueblo; was married, and had eleven children, who looked both healthy and dirty. The moment he understood who his visitors were, he did them the honour to doff his white cap and apron; and shortly after he appeared in a *round-about* ornamented with embroidery. He spoke his native language imperfectly, intermingling a great many Spanish words with it. He described himself as the *sous préfet*, and said, that he administered justice, inflicted punishment, and had the ability to make the inhabitants as happy as he thought they should be. On my asking, by what laws he administered justice, his answer was—by what he thought right—he had very little trouble, except guarding against the attacks of the Indians, and preventing them from stealing horses, of which he had great fears, he had, therefore, provided for the safety of his own by keeping them in a small shed attached to his house, and within a locked gate.

"He considered the Pueblo as in danger of attacks from the Indians, who were now in great numbers within striking distance, and had become very troublesome of late in driving off horses of which they had lost 300 or 400, and he said that pursuit was impossible, as they now had no troops. He entertained us with wine and beer of his own making.

"We took our departure a short time before sunset, amidst the gathering in of the villagers, with their goods and chattels, to a place of safety. There are two Americans settled here, who own mills. The evening was a beautiful one, and

we had a delightful ride back to the mission, and our horses, knowing they were on their return, were quite mettlesome.

"The mode of conducting business in this part of California," says Captain Wilkes, "is peculiar. Vessels, on reaching the coast, employ, as a supercargo or travelling agent, some person well known throughout the country, who visits all the pueblos, missions, and estancias, as a traveller, passing from place to place without any apparent object of business. He has thus an opportunity of inspecting the worldly affairs of those to whom he desires to sell; and if he finds them apparently thrifty, he produces his card of patterns, and soon induces a disposition on the part of his host or hostess to buy, being careful to secure in payment as much of their worldly goods as he can, and trusting them for the rest of the indebtedness. A few live cattle delivered by each purchaser at the neighbouring Pueblo, become by this means a large herd, which is committed to cattle-tenders who in due time slaughter them and deliver the hides in exchange for merchandise. A large amount of goods is thus disposed of to a very considerable profit. Large cargoes, consisting of a variety of articles, of both American and English manufactures are thus sold. From the state of the country, it has been difficult to obtain payments or returns in money; but the debts have usually been paid in cattle. When hides are given in payment, they are valued at two dollars, and are at all times the common currency of the country. No money is in circulation, unless what is paid by the foreign merchants; and in lieu of change an extra quantity of goods is taken, which excess is usually to the disadvantage of the buyer."

At *Santa Clara*, the party found beds that were clean and comfortable, though the apartment had a strong smell of cordovan leather. The only places of deposit for clothing, &c., was in the estancia, in large trunks.

"We were up betimes, but were threatened with disappointment in our horses. The kind and attentive Donna Aliza served us with chocolate and toast, and prepared cold tongues, chickens, and ample stores of bread for our use.

"After an hour's preparation, we took our leave and galloped off, in company with Don Miguel, who proposed to accompany us some six or seven miles on our way, to visit some of his herds, they were then feeding on the prairie. We had not proceeded far before we were overtaken by the person who had them in charge, coming at a furious gallop. He was mounted on the best horse I had seen in the country, and dressed after the Californian fashion, in a dark brown cloth jacket, thickly braided, both before and behind, with slashed sleeves, showing his shirt elegantly embroidered, both on the breast and sleeves; velvet breeches of bright blue, secured around his waist with a red sash, and open at the sides, ornamented with braid and brass bells in abundance; below the knee he wore leather leggings, fastened with garters, worked in silver, and below these, shoes, over which were fastened large silver spurs, with the heavy rowels of the country; on his head was

tied a red bandana handkerchief, and over that a huge broad-brimmed sombrero, with peaked crown, covered with an oil-silk cloth; the whole decorated with cords, aiguillettes, and ribands, with a guard-cord passing under the chin. His horse was equally well caparisoned, the bridle being decked with silver, as were the tips of his large wooden stirrups; with pillions and saddle-cloths in abundance. Few riders had so gay an air, or seemed to have so perfect a command of the animal he rode; and until we arrived at the wood where his Indians were looking out, he was an object of great attraction, assuming all the airs and graces of a person of high rank.

"After galloping for several miles, we reached a few trees and bushes, that are designated as the 'woods.' Near by was a large herd of cattle feeding. The *rancheros* we found lying about, in huts of hide, with a fire in front, and the leg-bone of an ox roasting over it; the skulls, bones, and the offal, lay about, with hides here and there pegged to the ground."*

The country which the party traversed on returning from the south to Yerba Buena, was then destitute of both water and grass, and the weather oppressively warm. In some places the scenery was picturesquely diversified by scattered oaks, laurels, and shrubs, but, to all appearance, the soil was unfit for cultivation. Wherever there was any running water, a pond, or vegetation, large flocks of geese and ducks were seen.

"The term *estancia*," observes Captain Wilkes, "seems to give one an idea of something more extensive than a small farm; it sounds more noble and wealthy; but whatever had been our opinion before, the reality disappointed us. Senor Sanchez's *estancia* at a distance was quite a respectable-looking building; the broad shadow cast by its projecting roof gave it a substantial and solid appearance; but a nearer approach dispelled these favourable impressions, and showed its uncouth proportions, as well as the neglect in which the whole was kept. The way to the house, which stands on a knoll, leads through miry places and over broken-down fences, winding around dilapidated ox-carts, over troughs, old baskets, dead hogs, dogs, and fowls, all huddled together. Rude articles of husbandry occupied the sides of the building."

CHAPTER XVII.

SOUTHERN OREGON.

THE party which, under the instructions given by Captain Wilkes, to the commander, departed on the overland expedition from Oregon to California, left Fort

* The hides of the cattle that die, or that are killed for food, are cured in this way.

Vancouver, and proceeded by the way of the Hudson Bay Company's farm on Multnomah or Wapautoo Island, near the place where Captain Wyeth had erected a fort. They then crossed the river and went towards the Faultz Plains, passing on their route a large grazing farm belonging to the company, and those of numerous settlers, who supplied them with fresh horses. In this direction they describe the country beautiful and the land rich, travelling over the prairies and hills. The hills were wooded with large pines, and a thick undergrowth of rose-bushes, rubus, dogwood, and hazel. The prairies were covered with variegated flowers, and abounded in *nuttalia*, columbines, larkspurs, and bulbous-rooted plants.

Some of the party had attacks of ague and fever. Dr. Whittle ascribed these attacks to the length of time, nearly five weeks, during which they had been encamped on the Willamette, and particularly to the position of the camp, immediately on the bank of the river, where it was subject to damp and fogs.

The settlers in the Willamette valley are described as generally those who have been hunters in the mountains, and were still full of the recklessness of that kind of life. Many of them, although they had taken farms and built log-houses, could not be classed among the permanent settlers, as they were ever ready to sell them and resume their old favourite trapping pursuits. The party proceeded up the Willamette river, until they reached Champooing, where they disembarked.

The country in the southern part of Willamette valley is described as stretching out into wild prairie-ground, gradually rising in the distance into low undulating hills, which are destitute of trees, except scattered oaks; these look more like orchards of fruit-trees, planted by the hand of man, than groves of natural growth, and serve to relieve the eye from the yellow and scorched hue of the plains. The meanderings of the streams may be readily followed by the growth of trees on their banks as far as the eye can see.

On the morning of the 9th they had a severe frost. In the course of the day they passed Creole Creek, and encamped on the *Ignas*. The atmosphere during the day had become thick, owing to the smoke arising from the burning of the prairie. Here they prepared themselves fully for their journey, by trimming their horses' hoofs, and adjusting other matters. The soil, a red decomposed basalt, appeared well adapted for grazing and wheat-lands.

On the 10th they travelled over a country intersected with small creeks, more hilly, and naturally yielding good pasturage. The rocks were previously basalt; those which now appeared were a whitish clayey sandstone. The soil also varied to a grayish brown. The surface had lately been overrun by fire, which had destroyed all the vegetation, except the oak trees, which appeared not to be injured.

After passing Lake Guardipii, which is about five hundred yards long, they encamped on the Lumtumbuff River, which is a branch of the Willamette. This river is a deep and turbid stream, branching out in places like a lake, but, in general, narrow and fordable.

On the 12th the route led across a parched-up prairie, portions of which were composed of gravel and white-sand, mixed with clay. "The paths were very rough, owing to the soil, which was much cut up by the herds that had been driven through, and which, on becoming hard, was exceedingly fatiguing to the horses. Bands of wolves were met with, and were, throughout the night, constantly howling on various parts of the prairie. The party had hitherto made from fifteen to twenty miles a day; and in travelling this day the animals suffered a great deal from want of water. They encamped on the Malé Creek, which was about thirty feet wide, and ran in a northerly direction.

On the 15th they arrived, with their horses exhausted from want of water, after travelling from fifteen to twenty miles a day, at the base of the Elk Mountains, which divide the valley of the Willamette from that of the *Umpqua*. The ascent and descent of this ridge slope gently. The hills were covered with pines, spruces, and oaks, with an undergrowth of hazel, arbutus, rubus, and cornus. Through these thickets they forced their way along the back of one of the spurs, and were three hours in ascending to the summit, which was fifteen hundred feet above the plain.

The route over the Elk mountains was tedious and difficult, owing to the obstruction caused by large fallen trees. Before ascending the mountain, they had crossed several small streams over which the Hudson Bay Company had constructed bridges for the passage of their flocks of sheep. At their place of encampment, during night, ice formed in the pools to the thickness of a quarter of an inch, and the thermometer had fallen to 26 deg.

They descended the following day, and encamped on the Elk river, and the hunters killed a large elk. Lieutenant Emmons, accompanied by three of the party, proceeded from the encampment for Fort Umpqua, fourteen miles distant. They found the country for the first five miles hilly, with scattered patches of pines, and it appeared in some places suitable for cultivation. The *trail* afterwards carried them over a succession of steep hills and through deep ravines, almost impassable for the horses, which were nearly then worn out with the journey.

Fort Umpqua, at which the detachment arrived greatly fatigued late at night, was found, like all those built in Oregon, enclosed by a line of high pickets, with bastions at diagonal corners; the whole area about two hundred feet square. It is situated more than one hundred and fifty yards from the river, upon the edge of an extensive plain, and was inhabited by only five men, two women, and nine

dogs, and contained a dwelling for the superintendent, as well as storehouses, and some smaller buildings for the officers' and servants' apartments. An unusual number of Indians of the Umpqua tribe were at the time assembled around the place. The superintendent said they had shown a strong disposition to attack and burn the fort. Lieutenant Emmons stated its latitude 43 deg. 24 min. north. From the account given by the superintendent, the river Umpqua flows in a north-westerly course a distance of thirty miles before it enters the sea. "It is navigable from the ocean to the place where the Umpqua and Elk rivers unite, about three miles below the fort, for vessels drawing not more than six feet water. The mouth of the Umpqua offers no harbour for sea-going vessels, and has only nine feet water on its bar. Its entrance is very narrow, with low sands on the north and south sides. The Umpqua fort district yields a considerable supply of furs; principally of beaver of small size."

Captain Wilkes says, the regulations of the company do not seem to be so strictly in force here as to the north of the Columbia, in relation to buying the small skins. These, he understood, they refuse to purchase there; and every Indian who is found with a small skin is refused supplies of ammunition, which has been found sufficient to prevent the killing of the young animals. Here they also obtain from the Indians some land and sea otter, deer, and bear skins.

The superintendent at Fort Umpqua exchanged strong horses for the exhausted horses of the detachment, and supplied Lieutenant Emmons with some bear and deer skins, to be made into shirts and trousers, which several of the party were in want of.

The river at the fort is one hundred and twenty yards wide, quite rapid, obstructed with rocks, and only navigable for canoes. The weather was cold and foggy. The soil in the vicinity is fertile, producing plentiful crops of maize, wheat, and potatoes. In the garden attached to the fort, are grown the vegetables common in the United States, with melons, both water and musk. Cattle are said to thrive well.

In respect to this part of Oregon and the route to California, Captain Wilkes observes—"Few of these men seem to know the reason of the whites meeting with so few mishaps in passing through an apparently hostile country; and many deem it is owing to their own skill and prowess. The truth is, that as soon as the Indians have traded with the whites, and become dependant on them for supplies, thenceforward they can be easily controlled. If disposed to be hostile, the fort at Umpqua would offer no resistance to their attack; but they are aware that all their supplies of ammunition, tobacco, blankets, and other articles of necessity, would be at once cut off, which would reduce them to great distress. The self-interest of the Indians is, therefore, the true safeguard of the white traders."

In the country surrounding Fort Umpqua a species of oak grew, resembling in its size and appearance that of the Willamette, excepting the lobes of the leaves, which were spiral at their termination; the acorns were larger and more deeply set in the cup. A yellow honeysuckle grew also on the banks of the river.

During the following day they passed over basaltic hills, and descended to another plain, with a loamy soil. The prairie was set on fire by the Indians, with the view, it was suspected, of obstructing the route.

Lieutenant Emmons the following day deviated from the usual route, and proceeded by the upper ford or pass across the Umpqua, as he had reason to believe that the Indians had made preparations to obstruct his passage at the lower ford.

Several of the party being in a sickly state, Lieutenant Emmons, after crossing the Umpqua, encamped in a beautiful oak-grove. A new shrub was met with resembling the shrubby geranium of Hawaii. A beautiful laurel (*laurus ptolemii*), with fragrant leaves; a canothus, with beautiful sky-blue flowers of delightful fragrance; a tobacco plant (*nicotiana*), of foetid odour, with white flowers. The first grisly bears were seen; the white tailed deer was lost sight of, and the black tailed species met with. Elks were seen in great numbers.

On the 20th the party moved onwards at an early hour, and passed, during the day, through valleys and over narrow plains, that afforded good pasturage.

They encamped on the south branch of the Umpqua river, having travelled along its eastern banks for some miles.

On the following day their route along the bank of the stream was over a country of the same description as before. Passing some stray Indian deserted camps they approached the Umpqua mountains, and stopped at the usual place to encamp previous to commencing the ascent. The trappers had all become reconciled to the arduous journey, and seemed willing to obey orders, as they had entered a hostile country, in which it would be dangerous for any one to straggle or desert.

On the 22nd they began a most difficult journey across the Umpqua mountains. The path upwards was narrow, and through a dense underwood. At times they cut their way through the brushwood following each other, forming a file of nearly a mile in length. Ascending an abrupt height of one thousand feet, many of the pack horses stumbled, but without any material accident. On the top was a small grassy plain, along which they travelled for a short distance, after which they descended rapidly into a valley, where water was found after passing the thickets. The woods had been lately on fire, and many of the trees were still burning. The fire had been lighted by the Indians for the

purpose of causing the trees to fall across the path with the view to impede the party, and in other places some of the branches were tied together across the trail. All the wood and ground was charred, and the party were completely covered with charcoal dust. From the summit of this ridge a view is had of a confused mass of abrupt ridges, between which lie small valleys. The whole range was thickly wooded with a variety of trees, among which are *pinus Lambertiana* (the first time it had been met with), oaks, arbutus, prunus, cornus, yews, dogwood, hazel, spiræa, and castanea. Dense wreaths of smoke were observed in various points: these were supposed to be from the fires of savages on the watch for the party and made as signals to muster for an attack if a favourable opportunity should offer. The *pinus Lambertiana* was not found quite so large as described by Douglas. The cones, about fourteen inches long, were small in circumference.

They encamped on the plain of the Shaste country, separated by the mountains which they had crossed from the Umpqua valley. The greatest elevation of the range was, by the temperature of boiling water, one thousand seven hundred and fifty feet. Among the plants they found the bulb used in California in the place of soap.

The next day's journey was over undulating hills; and, after travelling about twenty-three miles, they encamped on Young's Creek, a stream a few yards wide, and a foot or less deep, which may be traced from the heights for a long distance by the trees which border it. They were now within the country of the Klamet Indians, known as *rogues* or *rascals*, which name they have obtained from the hunters from their villany.

On the 25th they continued their journey over a country resembling that traversed the day before, with a light loamy soil, and less wood. The *pinus Lambertiana* was more common. The trees of this species were not beyond the usual size of the pine tribe, but their cones were about fifteen inches in length. Some of the sugar produced by this tree was obtained: it is of a sweet taste, with a slightly bitter and turpentine flavour. It resembles manna, and is obtained by the Indians by making a cavity in the tree, whence it exudes. This sugar is a cathartic, and affected all the party that partook of it; yet it is said that it is used as a substitute for sugar by the trappers and hunters.

Towards evening they entered on the plains of Rogues or Tootootutnas River, and encamped on its banks. This is a magnificent stream, upwards of 100 yards in width, with a rapid current flowing over a gravelly bottom at the rate of three miles an hour. It abounds in fish, on which the Indians chiefly subsist. The banks are low and overgrown with bushes. The soil is poor and sandy. Two or three hundred yards from the river there is a sudden rise of ten feet, and another at the same distance beyond, from the last of which the land rises into

hills from six hundred to a thousand feet in height. The formation of these hills and of the soil changes to granite and sand.

An Indian hunter killed a deer at some distance from the camp, and while in the act of skinning it was surprised by a party of Indians, who shot a flight of arrows over him; he sprang to his horse, seized his rifle, and, according to his own account, killed one of them, but left his game behind.

Towards night a canoe with two Indians approached the camp, which they were not suffered to enter. These canoes were made of trees hollowed out, square at each end. The 26th they passed along the banks of the Rogues' River which runs in a westerly direction. The Indians were observed spearing salmon from their canoes.

As the party proceeded the river was inclosed within a ravine between the mountains. The river flowed in rapids, owing to its ragged channel, and its banks were faced with cliffs of jagged rocks. In the afternoon they reached the Forks, and followed the southern branch, which brought them to the place of encampment, where a party accompanied by a Mr. Turner were attacked, and most of them massacred by the Indians, who were allowed to enter the camp in numbers as friends, when they suddenly rose upon the whites, nine in number, at the time of the attack attending to their horses. Two of the party were killed immediately. Turner, who was a strong, athletic man, was seated by the fire when the fray began. He snatched up a fire-brand and defended himself, dealing destruction around him until his wife brought him his rifle, with which he killed several Indians.

The party had suffered exceedingly before reaching this place from attacks of the ague. The chills were violent while they lasted, and several were obliged to stop for an hour or two during their continuance. The sudden and great atmospheric changes which constantly occurred tended to aggravate if they did not produce these attacks, the thermometer during the day frequently standing above 80°, at night fell nearly as low as the freezing point.

On the 27th they proceeded along the bank of the river; the Indians were gathering, and were heard yelling on the opposite bank. Precautions were taken to clear the path from any dangers by sending a detachment of foot in advance of the main party. The high perpendicular bank confined the path to very narrow limits, rendering it a dangerous point of attack from Indians, who might conceal themselves among the rocks on the opposite side of the rapid river.

A few miles beyond this pass the party left the banks of the Rogues' River, taking a more easterly route, over a rolling prairie, which is bounded by low hills, resembling the scenery of the Willamette valley. The soil, in some few places, was good, but generally gravelly and sterile. A few Indians were seen at a distance on horseback, who fled like wild animals. Some of the horses,

from being exhausted were left behind. In the afternoon they encamped on Beaver creek, so named by Lieutenant Emmons from the number of those animals which were seen building dams.

An antelope was killed, of a dun and white colour, and its hair was remarkably soft. The Indians take this animal by exciting its curiosity. For this purpose they conceal themselves among the nearest bushes to its feeding grounds, and making a rustling noise soon attracts the antelopes towards the place of ambuscade, when it is shot. If there are others in company they will frequently remain with the dead or wounded one until they are all killed. This species of antelope, according to the hunters, only inhabit the prairie, being seldom seen even in the open wooded country. The flavour of the flesh was considered superior to that of the deer.

On the 28th they advanced to the foot of the boundary range, where they encamped. The country resembled that passed over the day before, and the woods were oak and pine, but none of the *Lambertiana*. On the hills granite was observed.

On the 29th commenced the ascent of the *Boundary Mountains*, which separate Mexico from the United States. This range rises from 1200 to 2000 feet high. Some of the summits have a mural front; the features of all the ridges present a basaltic appearance. In some the sandstone and fossils protruded.

At the summit of this range, they had a first view of the Klamet valley. It was walled on both sides by high basaltic hills, rising above each other. Mount Shaste, a high snowy peak, of a sugar-loaf form, rose through the haze, southward about forty-five miles distant. They descended on the south side, and encamped on the banks of the Otter creek, within a mile of the Klamet river.

This ridge divides the waters flowing to the north and south. The soil was very sandy.

In consequence of the illness of some of the party, the whole remained nearly stationary on the 30th. The surrounding country appeared to be a broad prairie valley, dotted with oaks and pines, with serpentine lines of trees marking the edges of the streams until lost in the distance. This valley lies in the midst of hills, clothed with a forest of evergreens, and through this the waters of the Klamet flow, passing beyond it, through a narrow valley on the west. The most remarkable object in this place is an isolated conical peak, which rises immediately from the level plain to the height of 1000 feet, and is destitute of trees except on its summit.

On the 1st of October, they proceeded onward at an early hour. The weather was sultry, and the atmosphere smoky; they crossed the Klamet river, where it was about eight yards wide, about five feet deep, with a pebbly bottom, and with low banks destitute of bushes. Both above and below the ford, there were rapids.

From the appearance of its banks, it is subject to overflow. The prairie, after crossing the river, became dry and barren, and in which a solitary *bute* occasionally rose from 100 to 500 feet high. These *butes* are considered by Captain Wilkes as peculiar to this country. Heaps of volcanic rocks, consisting of large masses of grayish or reddish porphyritic lava, in blocks of from one to ten cubic feet in size, were lying on the surface in disorderly piles. To the eastward, the lava heaps became still more numerous.

They encamped on the southern branch of the Klamet river, which is a beautiful, clear, and rapid stream, where they found a small spot of grass, the only one they had seen during the day.

On the 2nd, they travelled over an undulated prairie, without water, the low ground was incrustated with salt, the soil appeared better than that passed over the day previous. Some patches of *spiræa* and dogwood were met with, and rather a better growth of grass.

Large herds of antelopes were seen, but none of them were killed. The hunters saw also mountain sheep with large horns. They found some holes containing water, from the want of which the horses suffered greatly; and they rushed into these holes with their packs, and stuck in the mire until dragged out, requiring much labour to extricate them. The party then turned off from the Klamet valley, which is far inferior to any portion of the country they had passed over: the formation appeared to be composed of a dark green serpentine. They encamped a little beyond these hills, where boulders of coarse syenite formed the bed of the creek and its banks. The hornblend crystals of the latter rock were often two inches long, set in a white granular feldspar.

At this camp they were visited by a party of Shaste Indians, who were allowed to enter, and for some time there was a brisk trade for their bows and arrows. These Indians were a good-looking race, much better proportioned than those more to the northward; their features more regular, and do not compress their heads. They wore their black hair hanging down to their shoulders.

They exhibited their archery, by putting up a button at twenty yards' distance, which one of them hit three times out of five: the successful marksman was rewarded with it, and a small piece of tobacco. They use these bows with such dexterity as to kill fish, and launch their arrows with such force, that one of the men remarked, "that he would as leave be shot at with a musket at the distance of a hundred yards, as by one of those Indians with his bow and arrow." These bows and arrows were beautifully made: the former are of yew, and about ten feet long; they are flat, and an inch and a half to two inches wide, and backed very neatly with sinew, and painted. The arrows are upwards of thirty inches long; some of them were made of a close-grained wood, a species of *spiræa*, while others were of reed. They were feathered for from five

to eight inches, and the barbed heads were made of finely wrought obsidian: the head is inserted in a grooved piece, from three to five inches long, and is attached to the shaft by a socket: this barb, when it penetrates, is left in the wound when the shaft is withdrawn, a very shallow blood channel is sometimes cut in the shaft.

Their quivers are made of deer, raccoon, or wild cat skin; these skins are generally whole, being left open at the tail end.

A disease was observed among them which had the appearance of the leprosy.

As to dress, they can scarcely be said to wear any, except a mantle of deer or wolf skin. A few of them had deer-skins belted around their waists, with an ornamented girdle.

On the 3rd, the exploring party travelled up the plain, from which they entered a forest on the slopes of the Shaste Range, by a path through the wood broken up by knolls of trachyte. On arriving at the top of the ridge, they had a magnificent view of the snowy peak of Mount Shaste, with an intermediate one, destitute of snow, with tall pines growing almost to its summit. The conical shape of the *Shaste* indicated its volcanic origin, although no crater was perceived. Its height is said to be 14,390 feet. Lieutenant Emmons estimates it as not so high.

After passing this ridge, they met the head waters of the Sacramento flowing to the southward, and their camp was pitched on the banks of another stream, that appeared to flow from the Shaste.

On the 4th, they ascended into the region of pines, some of which, the *Lambertiana*, were measured, and found to be eighteen feet in circumference, with cones sixteen inches long.

They encamped on Destruction river, which runs from the mountain range towards the south, in a place where they found food for their horses, and water in abundance. The air was pleasant; the forest protected them from the rays of the sun, and game was plentiful. Near the encampment in a north-west direction was a mountain ridge, shooting up in sharp conical and needle-shaped peaks, with precipitous sides.

During night, a storm raged from the westward, and occasionally was heard the crash produced by the falling of large pines.

The character of the country had now changed, and, according to Lieutenant Emmons' account, "afforded a new and more extended botanical field, as well as new geological features. The general tendency of the ridges is north and south, but the whole may be classed as a series of valleys and hills thrown in all positions. The hills are for the greater part covered with soil when it can find any place of deposit, and all are richly clothed with vegetation. The principal timber consists of pines and oaks, and there are many smaller plants, of which the flowers must be abundant in the proper season."

They continued along the course of Destruction river until the 9th, when it was joined by a stream from the north-eastward, supposed to be the north-east branch of Pitt river: it was larger than the stream they had been previously following.

They encamped fatigued, with their jaded horses exhausted, late in the evening near a small rivulet, to the westward of the Sacramento.

On the 10th they left the mountains. The width of the range where they had passed was upwards of 100 miles. At one place their guide lost his way; but an Indian woman pointed out the trail.

On descending into the valley of the Sacramento, they met with some Indians, who were known to be friendly.

The botanical character of the country changed suddenly. Instead of firs, pines, &c., the trees were sycamores, oaks, and cotton-wood. The oaks bear acorns, which are equally the food of the bears and the Indians. The prairie bordering the Sacramento at this place is about fifty feet below the upper prairie, which continues regularly for many miles on the same level; the latter falling into the former by a sloping bank.

Many of these Indians joined them. They had some resemblance to the Shaste Indians; most of them were naked; the others had a piece of deer-skin thrown over their shoulders; their faces were marked with an expression of good-humour.

Their food consists principally of fish and acorns; of the latter they made a kind of black cake, by shelling the acorns, drying them in the sun, and then pounding them between stones. They mix this meal with a little water, some arbutus berries, and make it into cakes about two inches thick, when it is wrapped in leaves and baked. It is quite black, and eats like cheese. These acorns are edible in the raw state. The seeds of the different genus of pine are also eaten, particularly a kind peculiar to California. The arbutus berry, which here abounded, is also ground for food. Grapes were also plentiful among them. The game was very abundant, in consequence of the abundance of food, and many antelopes and deer were observed. Large flocks of California partridges and geese were seen: among the birds was a new species of magpie.

The men only of this tribe visited the camp, the women remained at the *rancheria*, which the party visited. It consisted of small dirty huts, built of poles, and divided by coarse mats into a number of small apartments. The whole was surrounded by a brush fence.

The women were inferior to the men in personal appearance; they looked careworn and wrinkled drudges. They prepare all the winter's supply of food, while the men are to be seen lounging about, or engaged in games of hazard. The men are, during the season, occupied in taking salmon, either in weirs, or a long forked spear or fish-gig.

At the rancheria several dances were performed ; and many of the women were tatoed on their arms and body.

From what Lieutenant Emmons could learn there was no difficulty in proceeding in canoes from this place, though there would have been some obstacles to surmount, particularly the fish-weirs.

On the 11th the party proceeded down the westward bank of the Sacramento over an undulating prairie, considered as the most sterile they had met with. The soil consisted of gravel, coarse pebbles, and large stones, mixed with sand. They frequently crossed the beds of streams 300 yards wide, which intersect this part of the country, the pebbles in which are chiefly composed of jasper and white quartz, with a few of basalt, pudding stone, and pieces of slate. They travelled this day twenty-five miles, the longest day's ride on the journey.

On the 12th the party forded the river, and one of the hunters brought in the meat and skin of a large grisly bear which he had killed.

The river was about three feet deep, and 200 yards wide. They stopped at a place known among the hunters as Bear Camp, from the number of grisly bears found here ; five of which were shot the same afternoon, with three deer, which were feeding near the camp, all in excellent condition.

The country on the east side the river was more level than on the west, and the soil appeared to be better. Few plants were seen, in consequence of fire having overrun the surface.

The country continued much the same until they came in sight of the Prairie butes, a collection of hills, rising out of the level plain like islands from the water. These may be seen from a great distance. The party encamped on a small creek, called by the trappers the Little Fork of the Butes. The hunters said that the party employed by the Hudson's Bay Company the previous year, had caught more than 100 beavers while pasturing their cattle in this neighbourhood.

On the 16th they encamped, after an ineffectual search for water in the valley, or "kraal" of the butes. Here they found two deep holes of stagnant water, the remains of a rivulet that was dried up. The ground around and near the butes is covered with the bones of animals that resort hither for safety during the season of the freshets which flood the whole of this extensive plain. The soil was loose and crusted over with the deposit left by the water through which the horses' feet sank to the depth of four or five inches : nearer the butes, the soil was harder and strewed with fragments of volcanic rocks. These butes are grouped within an oval vale or plain, which has a circumference of about thirty miles : the longest diameter of the oval district lies in a north-east and south-west direction. The valley passes through the southern part, and opens out on the eastern : it is about seven miles in length ; here the party found water. This valley may be

considered almost as a prolongation of the exterior plain, though parts of it are somewhat higher, as appeared by its not having been overflowed. The highest of the butes was ascertained to be 1794 feet in diameter.

On the 17th they reached the banks of the Feather River, which is dangerous to ford on account of the quicksands. They crossed the stream, proceeded on to Captain Suter's, and arrived the next day at New Helvetia.

The party appears to have entered this valley with a high idea of its fruitfulness, and, with the expectation of finding the soil abounding with every thing that could render it desirable for agriculturists, and susceptible of producing all that would be necessary for the comfort and convenience of man. They were sadly disappointed when they found a large part of it barren and destitute even of pasturage, and that even the fertile portion was annually overflowed. The high prairie was equally gravelly and sterile. But Captain Wilkes considers "that there is a sufficient quantity of good soil for a valuable agricultural country, and that it would be capable of affording subsistence to a large number of inhabitants, more, however, from the extraordinary fertility of these grounds than from their extent."

After leaving New Helvetia, the party divided. The detachment under Lieutenant Emmons embarked in the Vincennes launch, which met them a short distance below that place, and reached San Francisco on the 24th.

The other detachment, under Mr. Eld, proceeded by land on the 21st, and commenced their journey, with a young and intelligent Spaniard for a guide. The same day they made fifteen miles, passing over a dry portion of the country, and encamped near two ponds, called in the country, Poros, the only place, as was supposed, where water could be obtained within twenty miles; they however, found some the next day in the Rio Cosmenes, within a mile and a half of the camp. Game was, as usual, very abundant; but the whole country was suffering from the drought.

On the 22nd, about noon, they crossed the river Mogueles, which was then a small stream, but at other seasons, it is said, it cannot be crossed on horseback. They travelled this day as far as the San Juan; the only water that it contained was a small pool. This place had been termed the Frenchman's Camp. Wild ducks and geese had rendered the water scarcely drinkable.

On the 23rd, before noon, they reached the San Joachim, which they found about fifty yards wide and about three feet deep. Under the expectation of finding water, they were induced to ride forty-four miles, but were again disappointed. On the 24th they entered among the Pul Porrice hills, a bare and barren range, composed of sandstone and volcanic rocks. As they approached the mission of San José, the country became more hilly, the oak abundant, and herds of cattle and horses were seen. On their way they fell in with large en-

campments of Indians, who were busily employed in collecting acorns. These men were clothed in shirts and trousers, some in velvet breeches ; the women in calico gowns and gay-coloured shawls : several hundred of these were met, each loaded with the beef which is distributed to them in weekly rations. They are annually allowed a short holiday to return to their native wilds during the acorn season.

The approach to the mission which was once a large establishment, had all the appearance of a town, being built in the form of a street of considerable length. In the centre was the church and convent, with large dwelling-houses on each side of it, and on the opposite side the houses for the neophytes, consisting of small, low buildings, with every appearance of filth and decay about them. The walls and gates are dilapidated, and every thing wears the aspect of neglect, both in the buildings and the inhabitants. It is no longer the abode of hospitality and good cheer since it has fallen into the hands of the administrators or agents of the government. Within a large and neglected garden there was some good fruit, and there were still extensive fields of Indian corn, which were formerly cultivated by irrigation.

The reception of the party was neither hospitable nor friendly.

The administrator told them there was no accommodation for them. They met with the tailor to the establishment, an American of Philadelphia, who took them round the gardens, through the churches, and told them that the Indians under the care of the mission were, at the present time, about six hundred, which was only one-third of the number they had two years before. In consequence there was but little cultivation carried on compared to what there had been formerly.

The harvest at the mission had been ruined by the great drought. No rain had fallen for upwards of a year. The vintage, however, had been good, and forty barrels of wine had been made, besides a large supply of grapes for the establishment. The two vineyards comprised about four acres, and besides vines, were stocked with apple, pear, and other fruit-trees. The buildings of the missions were all constructed of adobes and covered with tile roofs.

Mr. Forbes, the agent of the Hudson Bay Company, residing a few miles further, happened to be at the mission, and conducted the party to his house. They found him lodged in a comfortable two-story adobe house, situated on the borders of an extensive prairie, but without any trees or cultivation around it. He entertained them most hospitably.

Although this journey from the Columbia to the Sacramento was attended with much fatigue, yet the labour and suffering were more than compensated by the information it furnished in relation to the southern section of Oregon. Although every thing was not attained that Captain Wilkes intended, yet he felt satisfied that all was done which the limited time and the hostile state of

the country would permit. He says, "To the perseverance and prudence of Lieutenant Emmons much credit is due, as well as to the other officers and naturalists, for the manner in which they co-operated with him. The duties assigned them were performed under the most trying circumstances, while worn down by distressing attacks of the ague and fever. This disease, in particular, affected those members of the party who had been encamped on the Willamette, where it was supposed they contracted it."

CHAPTER XVIII.

EXPLORATION OF NORTHERN OREGON AND THE COLUMBIA RIVER BY THE UNITED STATES EXPLORING EXPEDITIONS.

SINCE the time of journeys made by Lewis and Clark to the Columbia, and the establishment formed at Astoria by Jacob Astor, several trading adventurers have made excursions across the Rocky Mountains and down the Columbia River. Captain Wilkes, and those under his command, have, however, given us the most complete and satisfactory account of Oregon, its harbours, and the River Columbia. Four years later, Captain Fremont, of the United States Topographical Engineers, was instructed to proceed to the eastern limits explored by the expedition under Captain Wilkes. Both these expeditions having been under official authority, the following sketches of those regions are drawn up, condensed, or abstracted from the journals and accounts which were kept by the respective travellers.

The expedition of Captain Wilkes was directed to the circumnavigation of the globe, to exploring the southern Polar regions, the islands of the Pacific, California, Oregon, and its rivers and harbours, and various parts of the Asiatic and African coasts. He sailed from the Sandwich Islands for the Columbia River, in attempting to pass the bar of which, some time after his arrival, one of the ships under his command was lost, and according to his description of the entrance of this river, its importance for maritime intercourse with Oregon is attended with great, and, except with much delay, almost insurmountable danger.

On the 28th of April, 1841, at 6 A.M., he made Cape Disappointment, which, he says, "we soon came up with. A heavy sea, caused by the strong winds that had prevailed for several days, was running. I, notwithstanding, stood for the bar of the Columbia River, after making every preparation to cross it; but on approaching nearer, I found breakers extending from Cape Disappointment to Point Adams in one unbroken line.

"I am at a loss to conceive how any doubt should ever have existed that here was the mouth of the mighty river whose existence was reported so long before the actual place of its discharge was known, or how the inquiring mind and talent of observation of Vancouver could have allowed him to hesitate, when he must have seen the evidence of a powerful flood of fresh water contending with the tides of the ocean, in a bar turbulent with breakers, in turbid waters extending several miles beyond the line of the shore, and in the marked line of separation between the sea and river water.

"Such appearances must be constant, and if seen, the inferences could hardly be questionable, that the great river of the west poured itself into the ocean at this point.

"Mere description can give little idea of the terrors of the bar of the Columbia. All who have seen it have spoken of the wildness of the scene, and the incessant roar of the waters, representing it as one of the most fearful sights that can possibly meet the eye of the sailor. The difficulty of its channels, the distance of the leading sailing marks, their uncertainty to one unacquainted with them, the want of knowledge of the strength and direction of the currents, with the necessity of approaching close to unseen dangers, the transition from clear to turbid water, all cause doubt and mistrust.

"Under such feelings I must confess that I felt myself labouring; and although I had on board a person from the Sandwich Islands who professed to be a Columbia River pilot, I found him at a loss to designate the true passage, and unable to tell whether we were in a right way or not. I therefore at once determined to haul off with the tide, which was running ebb with great rapidity, and which soon carried us back into the blue waters of the ocean, to wait there until the sea on the bar had in some measure subsided.

"The land near the mouth of the river is well marked, and cannot readily be mistaken, and on the summit of the two capes, are several lofty spruce and pine trees, which the officers of the Hudson's Bay Company have caused to be trimmed of branches nearly to their tops. These serve as conspicuous marks, but our pilot was ignorant of their relation to the channel.

"Our passage from Oahu had been no more than twenty-two days, which is unusually short. The first part of it, until we passed in lat. 28 deg. north, beyond the influence of the trades and variables, had been, as already stated, attended with light and contrary winds.

"The temperature of the air had fallen from 78 deg. to 43 deg., and that of the sea to 46 deg.

"During the night we had boisterous weather, and the ship was very uncomfortable, in consequence of her shipping water in considerable quantities through the hawse-holes, which flooded her gun-deck. As in conformity with

my determination to wait until the surf on the bar should have subsided, the anchors would not be needed for some days, I ordered the chain cables to be unbent, which would permit the hawse-holes to be closed.

"During the night I took into consideration the loss of time that must arise from awaiting an opportunity to cross the bar, and after due reflection came to the conclusion that it would be better to proceed at once to the Straits of Juan de Fuca, and there begin my work on this coast.

"The coast of Oregon to the south of Cape Flattery, is rocky, much broken, and affords no harbours, except for very small vessels. It may be considered as extremely dangerous, particularly on account of its outlying rocks. The soundings off the coast were discovered to serve as a certain indication to avoid danger by not approaching the shore nearer than seventy fathoms.

"On the morning of the 1st of May, we found ourselves well into the Straits of Juan de Fuca, and anchored in Port Discovery on the afternoon of the 2nd of May, forty-nine years after Vancouver had visited the same harbour.

"The Straits of Juan de Fuca may be safely navigated. The wind will for the greater part of the year be found to blow directly through them, and generally outwards: this wind is at times very violent. The shores of the strait are bold, and anchorage is to be found in but few places. We could not obtain bottom in some places with sixty fathoms of line, even within a boat's length of the shore.

"The south shore is composed of perpendicular sandy cliffs, that run back into high and rugged peaks, and is covered with a forest of various species of pines, that rises nearly to the highest summits of the mountains, which are covered with snow; among them Mount Olympus was conspicuous, rising to an altitude of 8138 feet."

The north shore is rocky, and composed, as far as Captain Wilkes examined it, of conglomerate, and in some few places of a reddish granite.

On the following morning the ships were boarded by a large canoe, with Indians who spoke a few words of English. They seemed to have scarcely any idea of decency, and to be little less elevated in their morals than the wretched natives of Terra del Fuego.

Captain Wilkes says, "They were short thick-set, bow-legged, muscular, and seemed capable of enduring great fatigue. The most obvious peculiarity was the shape of their heads, which appears to have been compressed, both before and behind, so as to give them the form of a wedge. Their cheek-bones were high, and their eyes, which were fine, were set wide apart; their colour was a light copper, The oblique eye of the Chinese was not uncommon, and they had long flowing hair: aquiline or Roman noses were prevalent. Their countenances wore an expression of wildness, and they had, in the opinion of some of us, a melancholy cast of features."

The ships then proceeded onwards, and late in the afternoon reached and weathered a low sand-point, called by Vancouver, New Dungeness, and stood over for his Protection Island. They passed within less than a quarter of a mile of the point, in three and a half fathoms' depth of water.

After passing that island, an extensive bay opened: on the shores were seen the long poles mentioned by Vancouver. The use of these he was unable to discover, but the Indians informed Captain Wilkes, "that they were for the purpose of suspending nets for taking the wild-fowl that frequent the shores in great numbers. On these poles the nets are set up at night, at which time the geese search these grounds for food; fires are then lighted, which alarm the birds, and cause them to fly against the nets, by which they are thrown upon the ground, where, before they have time to recover themselves, they are caught and killed."

Captain Wilkes observes, that "the description of Vancouver is so exactly applicable to the present state of this post, that it was difficult to believe that almost half a century had elapsed since it was written. The beautiful woods and lawns of Protection Island in particular, exist unchanged. The lawns still produce the same beautiful flowers and shrubs, and although closely surrounded by dense woods, do not seem to have been encroached upon by their luxuriant growth, although there is no apparent reason why it should not long ere this have overrun them.

"Our anchorage in Port Discovery was close to the shore, in twenty-seven fathoms water. It is a well-protected harbour, and very convenient of access, but the high precipitous banks would almost preclude its being made the seat of a settlement.

"The name of Port Discovery was given by Vancouver. It is eight miles long, two miles in average width, and its points, which terminate in low sandy projections, interlock each other. The shores are supplied with large quantities of shell-fish. Protection Island covers it completely to the north, and would render it easily defensive against the most formidable attack. The only objection to it as a harbour is the great depth of the water, which in the middle is nowhere less forty or fifty fathoms, and is often as much as sixteen fathoms close to the shore."

The Indians, a most filthy race, occupied a few miserable lodges on one of the points.

During his stay at Port Discovery, they supplied Captain Wilkes plentifully with venison, ducks, geese, salmon, a large species of cod, flounders, herrings, and crabs. They also brought shell-fish, among which were the common clam, muscles, and small oysters.

He remained at Port Discovery until the 6th of May, during which time he employed his people in surveying the harbour and exploring the country. The botanists of the expedition discovered an interesting field opened to them amidst

the great variety and beauty of the *Flora*. Dodecatheon, Viola, Trifolium, Leptosiphon, Scilla (the cammass of the natives), Colliersia, Claytonia, Stellaria, &c., vied with each other in beauty, and were in such profusion, as to excite both admiration and astonishment.

According to Mr. Brackenridge, the soil on which the plants grow consists of a light brown loam, but the general character of the soil around Port Discovery was a thin, black, vegetable mould, with a substratum of sand and gravel.

The trees grow so closely, that in some places the woods are almost impenetrable. The timber consists principally of pine, fir, and spruce. Of the latter there are two species, one of which resembles the hemlock-spruce of the United States: it is of very tall growth, and puts out but few, and those small, lateral branches. Some maple-trees grow in the open grounds and on the banks, but they are too small to be of any service for building purposes. Several trees which they had cut down to make spars for the Vincennes, proved, although healthy in appearance before they were felled, to be more or less defective; the wood was sound and compact on one side only, while on the other it was opened, grained, and fibrous.

On the 5th of May, the officers were all engaged in surveying, and Captain Wilkes occupied one of the points as a station, where he made astronomical and magnetic observations. He found the latitude 48 deg. 02 min. 58 sec. north; the longitude 123 deg. 02 min. 07.5 sec. west; the variation was 20 deg. 40 min. east. The temperature in the shade was 55 degrees.

On the 6th of May, finding that the messenger whom he had despatched to Fort Nisqually did not return, Captain Wilkes determined to proceed towards that place without delay. He weighed anchor, and the ships got under way at half-past ten, and beat out of Port Discovery. He stood towards Point Wilson (of Vancouver), which forms one side of the entrance into Admiralty Inlet. Turning the point, he entered the inlet and anchored in Port Townsend, on its northern side, in ten fathoms water. Port Townsend is a fine sheet of water, three miles and a quarter in length, by one mile and three-quarters in width. Opposite to the anchorage there is an extensive table land, without trees. He considers that it would afford a good site for a town.

The bay is free from dangers, and is well protected in the directions from whence high winds blow. The anchorage is of convenient depth, and there is abundance of fresh water to be had. The soil is a light sandy loam, and appeared to be fertile. It was covered with wild flowers, and strawberry plants in blossom.

From this point Mount Baker is distinctly seen to the north-east, and forms a remarkable object, especially when its conical peak is embellished by the rays of sun-setting.

On the 7th he completed the survey. At noon both vessels moved up about eight miles, and anchored in a place which he called Port Lawrence. This harbour is at the entrance of Hood's Canal, from whence they had a view of it, and of Admiralty Inlet. The weather was unpleasant, and the only duty that could be performed was that of dredging for shells. Several new specimens were thus taken. The natives brought them plenty of fish, venison, geese, and ducks.

"On the morning we made the survey of Port Lawrence, beginning at daylight. This being completed, I took advantage of the tide making to get under way with a fresh breeze, and passed with both vessels as far as a small cove on the west side of the inlet, opposite to the south end of Whidby's Island. Here we anchored before sunset.

"We were under way soon after daylight, taking advantage of the tide, and continued beating as long as it lasted. This was about two hours, by which time we reached another small cove. This was named Appletree Cove, from the numbers of that tree which were in blossom along its shores. This cove answers well for all the purposes of a temporary anchorage. Before the tide began to make in our favour, we had finished the survey of the cove. We again sailed, and at dark anchored under the west shore, near a fine bay, which the next day was surveyed and named Port Madison. This is an excellent harbour, affording every possible convenience for shipping."

The scenery of this portion of the Admiralty Inlet is described by Captain Wilkes as resembling parts of the Hudson River, particularly those about and above Poughkeepsie. The distant highlands, though much more lofty, reminded him of the Kaatskills. He saw but few Indian lodges on his way up, and the shores appeared as if never having been intruded upon by man.

The wind proved fair; the ships sailed up the inlet by the passage to the right of Vashon's Island, and anchored in sixteen fathoms water, below the narrows leading into Puget Sound, within a few yards of the shore, and under a high perpendicular bank.

The shores of all these inlets and bays are so bold, that in many places a ship's side would strike the banks before the keel would touch the bottom.

On the 11th of May he surveyed this part of the sound, and on the turn of tide sailed inwards, but had great difficulty in getting beyond the reach of the eddy winds occasioned by the high banks. On each side of this pass, high projecting bluffs of sandstone, ornamented along their base with shrubbery, rose almost perpendicularly from the water. The tide runs through the narrows with great velocity, carrying forward a ship amidst eddies and whirlpools.

Captain Wilkes observes, "The Porpoise succeeded in entering the narrows first, and in a few minutes was lost sight of. The Vincennes entered, and seemed

at first to be hurrying to destruction, with her sails quite aback. We were carried onward wholly by the force of the tide, and had backed and filled only once before we found ourselves in as spacious a sound as the one we had just left. This narrow pass seems as if intended by its natural facilities to afford every means for its perfect defence. Twelve miles more brought us to the anchorage off Nisqually, where both vessels dropped their anchors about eight o'clock. Here we found an English steamer (belonging to the Hudson's Bay Company) undergoing repairs. Soon after we anchored I had the pleasure of a visit from Mr. Anderson, who is in charge of the fort, and Captain M'Neil. They gave me a warm welcome, and offered every assistance in their power to aid me in our operations."

In describing these inlets he says, "Nothing can exceed the beauty of these waters and their safety. Not a shoal exists within the Straits of Juan de Fuca, Admiralty Inlet, Puget Sound, or Hood's Canal, that can in any way interrupt their navigation by a seventy-four gun ship. I venture nothing in saying there is no country in the world that possesses waters to equal these."

The anchorage off Nisqually is contracted by the rapid shelving of the bank, which abruptly falls into very deep water. The shore rises at the same places to the height of about two hundred feet, above and beyond which a table-land extends, covered with pine, oak, and ash trees, in clumps, or detached. This plateau appears like a vast park. The ascent is overcome by a well-constructed gently winding road, from the summit of which there is a splendid view of the sound, its numerous islands, Mount Olympus covered with snow in the background, and Fort Nisqually, with its out-buildings and enclosure about half a mile from the slope of the table-land.

The Porpoise, with two of the Vincennes' boats, under Lieutenant-commandant Ringgold, were directed to the survey of Admiralty Inlet. The launch, the first cutter, and two boats of the Vincennes were placed under the command of Lieutenant Case to survey Hood's Canal. A land party was formed to explore the interior, and placed under the command of Lieutenant Johnson, of the Porpoise, accompanied by Dr. Pickering, Mr. T. W. Waldron of the Porpoise, Mr. Brackenridge, Sergeant Stearns, and two men. Eighty days were allowed them for the excursions through the interior to cross the cascade range of mountains to the river Columbia, and then to proceed to Fort Colville, thence south to Lapevai, the mission station on the Kooskooskee River, thence to Walla-walla, and finally to return by the way of the Yakima River, and repass the mountains to Nisqually.

Another land party, consisting of Captain Wilkes, Messrs. Drayton and Waldron of the Vincennes, and two servants. The intended route proposed by the latter was across the country to the Columbia River, to visit Astoria, then Fort Vancouver and the Willamette settlement, and to proceed up the river as far

as Walla-walla. Captain Wilkes expected to find the ship Peacock safe at Astoria, and to despatch parties from that vessel into the interior, and with her boats to commence a survey of the Columbia River.

CHAPTER XIX.

NISQUALLY—HUDSON BAY COMPANY'S TRADING AND AGRICULTURAL OPERATIONS.

THE fort at Nisqually is constructed of pickets, enclosing a long square space each side, about 200 feet, with four corner bastions. Within this enclosure are the agents' stores, and about half-a-dozen houses, built of logs, and roofed with bark. This fort was considered sufficiently large when first established, but since Nisqually has become an agricultural as well as a trading post, it is found insufficient for the purpose, and its situation is ill chosen, on account of the difficulty of obtaining good water, which is nearly a mile distant. Captain Wilkes was informed that there was little necessity for protection against the Indians, who had become few in number and peaceably disposed.

Mr. Anderson and Captain McNeil resided in the fort with their families: both were married to half-breeds, and had several fine children. In their garden there were growing strawberries, gooseberries, salads, &c. They had fine fields of grain, large barns and sheepfolds, agricultural implements, and workmen with cattle were engaged in the various employments of husbandry.

A Dr. Richmond who had been settled there for some months, "occupied a nice log-house, built on the borders of one of the beautiful prairies."

There is a mission-house at some distance, on the borders of an extensive and beautiful prairie, which Captain Wilkes says, "would be admirably adapted for a large settlement, if the soil was in any respect equal to its appearance. This is composed of a light brown earth, intermixed with a large proportion of gravel and stones: it requires an abundance of rain to bring any crop to perfection, and this rarely falls during the summer months. At the season when we arrived, nothing could be more beautiful, or to appearance more luxuriant than the plains, which were covered with flowers of every colour and kind: among these were to be seen ranunculus, scilla, lupines, collinsia, and balsamoriza (a small sunflower peculiar to Oregon); but the soil is quite thin, and barely sufficient for these in many places. The best land occurs where the prairies are intersected or broken by belts of woods, that have a dense undergrowth, consisting of hazel, spiræa, cornus, and prunus. On the borders of these belts are scattered oaks and some

ash, arbutus, birch, and poplars, and in some places the yew is to be found; but the predominant character of the vegetation is of the tribe of coniferæ, which seem to occupy large ranges of the country, and among which the cedar is found to attain a large size."

Belonging to the company's establishment at Nisqually, there are a large dairy, several hundred head of cattle, and among them seventy milch cows, which yield a large supply of butter and cheese, large crops of wheat, peas, and oats, potatoes, &c., are raised. These operations are managed by a farmer and dairyman, who were sent for these purposes from England. A few Indians are engaged in attending the flocks, and the company's servants are almost exclusively employed as labourers.

PUGET SOUND COMPANY.

Captain Wilkes remarks, that he has described these agricultural establishments as connected with the Hudson Bay Company. They are *de facto* so; but as the charter precludes farming operations, another company has been organised, under the title of the "Puget Sound Company," the shares of which are held by the officers, agents, and servants of the Hudson Bay Company, and its officers are exclusively chosen from among them. Dr. McLaughlin, for instance, chief officer and governor of Fort Vancouver, on the part of the Hudson's Bay Company, is also a director of the Puget Sound Company, and has the entire management of its concerns. His salary is five hundred pounds.

The capital of the latter Company is five hundred thousand pounds, divided into shares of one hundred pounds each. Two hundred thousand pounds was found sufficient capital, and no more was paid in.

"The operations of this company," says Captain Wilkes, "are, in consequence, large: they began by making large importations of stock from California and some of the best breed of cattle from England. They have also entered into farming on an extensive scale, using as labourers the servants of the Hudson Bay Company, who are bound by their contracts to do all manner of service that may be required of them, even to the bearing of arms.

"This company supplies all the forts and stations of the Hudson's Bay Company on the west of the American continent, and also furnishes the Russian ports with wheat, butter, and cheese. The Russians take annually about fifteen thousand bushels of wheat. The directors of the company expect to succeed in breeding a sufficient stock of cattle and sheep, to enable them to export hides, horn, tallow, and wool to England in the return ships, which hitherto have left the coast comparatively empty, as the furs occupy only a small portion of the ship. Captain Wilkes is of opinion "that they will be enabled to drive a profitable trade, particularly when it is considered how little care the cattle require

in this territory, in consequence of the grass and natural hay which the soil affords at all seasons. It is the prospect of the advantageous results to be derived from these operations, that has induced the Hudson's Bay Company to change their trading establishments into large agricultural ones. For some years previous to our arrival, they had not been able to meet their own wants, and at the same time fulfil their contracts with the Russians. They were, therefore, obliged to purchase from the settlers in the territory, as well as send to California, to procure the requisite quantity of agricultural products. A demand was consequently created for wheat, and all that could be raised in the Willamette settlements was bought for six shillings currency (seventy-five cents) a bushel, and paid for in drafts on their *stores*, in goods, at fifty per cent advance on the first London cost. This gave an encouragement to the small farmers, that was fated to meet with grievous disappointment the next season; for the company was able not only to meet their engagements, and their own wants, but had, besides, a surplus. The prices consequently would be merely nominal, unless raised by the influx of new settlers. Whether the latter cause had any effect in creating a market, I know not; but I understand, that in 1842, some of the settlers fed their horses upon their finest wheat."

The scenery around Nisqually embraces a splendid panorama, with Mount Rainier, rising nearly east of it; there are two or three other magnificent snowy peaks. They are all nearly regular cones, with summits indicating extinct volcanoes. One of these, Mount Hood, Captain Wilkes intended to ascend but was prevented in consequence of the loss of the Peacock.

The steam-vessel employed at Nisqually by the Hudson's Bay Company, is stated by him to be ill-adapted for the purpose from her incapacity to carry necessary fuel for her entire voyage, which occasions great delay by stopping at intermediate places, where a supply of wood is only obtained by cutting it by the crew. But this vessel was, however, equipped with a sufficient armament, barricades, and boarding-nettings, deemed essential on the northern coast, where the savage tribes are hostile and numerous.

After the several parties were in readiness to start on their respective expeditions, Captain Wilkes proceeded with his own party for the Columbia River. He says, "It was a strange cavalcade, for most of us were but sorry horsemen, and we had every variety of accoutrements, from the saddle and bridle to the bare back and halter. We were eight in number: Messrs. Drayton, Waldron, and myself, two servants, two Indians, and a Canadian guide, with four pack-horses. The horses and the guide were kindly furnished us by the gentlemen at the fort, to carry us as far as Cowlitz Farms, about sixty miles distant, where we intended taking canoes. Our Indians, though partially clothed in worn-out European clothing, still showed their free and easy carriage on horseback: the few ribands and cocks' feathers that were stuck in their caps gave them a flaunt-

ing kind of air; and they manifested a species of self-esteem that was not unpleasing, and betokened an independence and want of care, in good keeping with their mode of life. These savages should never be seen but on horseback, in which position they are really men, and inspire a certain degree of respect. When dismounted, all these qualities vanish, and the Indian becomes the lazy, lounging creature, insensible to any excitement but his low gambling propensities. They have a peculiar knack in managing their horses, and this, too, without any apparent means of controlling them, for their only bridle is a single cord fastened to the lower jaw; with this they contrive to govern the most refractory animals, without the aid of whip or spur, and will urge to speed an animal that has become all but lifeless under our guidance. They practise great cruelty to their horses, and pay no regard whatever to the state of their backs."

They travelled nearly south over grassy lawns, interspersed with groves of oak and ash-trees, until they reached the river Nisqually, the channel of which running between precipitous banks, is about 300 feet below the plain. Its ravine, about half a mile wide, is filled with large timber trees, occasionally uprooted by the torrents occasioned by the melting of the snows in the mountains. The usual bed of the stream is about 100 yards wide, with a rapid current: its course in this place was north-north-west. Its average depth at the ford where the parties crossed was about three feet. They ascended the opposite high banks, and reached the table-land on the plain; the route over which unfolded the most beautiful park scenery, with the prairie now and then opening to view, in which magnificent pines grew detached. The prairie was covered with a profusion of flowers.

After crossing *Shute's* river, the features of which are similar to those of the Nisqually, they encamped and lighted fires before dark, having travelled about twenty-two miles. On examining the alforcas, or saddle-bags, they found the small stores had been damaged in fording the river. In the lower country, snakes were observed, but they are seldom venomous; the rattle-snake is rarely seen, in consequence of the dampness of the climate. In the middle section, where it is dry, they are met in great numbers. Elk and deer had been attracted by the fire during the night. The grass around the tents was of the most nutritious kind for the horses to feed on.

In the morning, on resuming the journey, the *park*-like scenery increased in beauty; "And," Captain Wilkes observes, "it was almost impossible to realise that we were in a savage and wild country, and that nature, not art, had perfected the landscape. Beautiful lakes, with greensward growing to the water's edge, with deer feeding fearlessly on their margin, and every tint of flower, many of which were not new to our gardens at home, strewn in profusion around; we could hardly, in galloping along, but expect to see some beautiful mansion, as a fit accompaniment to such scenery!"

The Bute prairies over which they passed, are extensive, and covered with tumuli, or small conical mounds, about thirty feet in diameter, six to seven feet high above the level, and many thousands in number. "We opened three of the mounds, but nothing was found in them but a *pavement* of round stones."

After a ride of twelve miles they reached Chickeeles River, which flows into Gray's Harbour, about forty miles north of the Columbia. Its stream was about 200 yards wide. On its banks there were a few lodges containing about twenty Indians of the miserable Nisqually tribe, who had come here to make preparations for the salmon-fishery, then about to commence (20th of May). Hanging around their lodges were hundreds of lamprey eels, from a foot to eighteen inches long, and an inch thick. These fish are caught in great quantities and dried for food; they are also used for candles or torches: for being full of oil they burn brightly.

On proceeding, the soil changed from gravel to a rich unctuous clay. After crossing the branch of the Chickeeles, they passed over some high hills, the track being exceedingly difficult, and so miry that the pack-horses frequently stuck fast. The woods and underbush grew also so thickly, that it was with difficulty that a horse and rider could pass; fallen trees were to be jumped or hobbled over. They finally ascended to the crest of the heights, "where," Captain Wilkes observes, "we commanded one of the most charming views I saw in Oregon, extending to a distance over the luxuriant country, while at our feet lay one of the beautiful prairies, bedecked in every hue of the rainbow, with the Chickeeles winding through it." They descended and passed over the prairie to some Indian lodges, whose inhabitants were squalid and dirty. Their route then lay through alternate woods and prairies, the former composed of large pines and cedars. Several considerable streams of water were crossed. The banks were not so high as those before passed. "The latter," he says, "covered with strawberries, so tempting as to induce us to dismount and feast upon them, and many plants that excited a feeling of interest, and reminded us of home: among the number was the red honeysuckle (*caprifolium*), which was in full bloom. After passing extensive *Cammass* plains, the party reached the company's farm on the Cowlitz, which occupies an extensive prairie on the banks of that river.

This establishment comprises 600 or 700 acres enclosed, under skilful cultivation, with several large granaries, a large farm-house, and numerous out-buildings, to accommodate the dairy, workmen, cattle, &c. The fields were covered with a luxuriant crop of wheat. At the further end of the prairie, there was a settlement with its orchards, &c., and amidst a grove of trees, stood the chapel and house of the Catholic mission. "The place," says Captain Wilkes, "resembled that of a settlement of several years' standing in our western states, with the exception, however, of the remains of the conquered forest (charred stumps); for here the ground is ready for the plough, and nature seems as it were to invite the husbandman to his labours."

The party was hospitably entertained by Mr. Forrest, the superintendent, who readily made arrangements for canoes to carry the expedition down the Cowlitz and Columbia rivers to Astoria, or Fort George.

At this farm the company had then a large dairy, and were about erecting a saw and grist mill. The superintendent's dwelling was large and built of well-hewn logs, with the workmen's houses, &c., it formed a village.

Captain Wilkes observes, "Large numbers of cattle were being brought in for the night, which is a very necessary precaution in Oregon, in consequence of the numerous wolves that are prowling about. In some places it becomes necessary for the keeper to protect his beasts even in the daytime. The cattle at times suffer from drought, in which case the Indians are sent across the river to cut fodder for them, in order to avoid sending the cattle to the *cammass* plains, where they would be subject to the loss of all their young. The farm at the Cowlitz has no sort of defence about it, proving, as far as the Indians are concerned, that there is no danger of being molested; indeed, their numbers here are too small to attempt any aggression, and their dependence on the company for both food and clothing too complete to allow them to quarrel except among themselves. Of such disputes the agent of the company takes no sort of notice. The mortality that has attacked them of late has made sad ravages, for only a few years since they numbered upwards of a hundred, while they are now said to be less than thirty. The quantity of land contained within the company's farms at the Cowlitz was then about six hundred acres, most of which was under wheat."*

Around the superintendent's house there was a kitchen garden, in which all the usual horticultural plants, similar to those of the United States, were growing luxuriantly.

The superintendent informed Captain Wilkes that the weather was never actually cold, nor the winter long. Snows seldom lasted more than a day or two; fires were, however, found comfortable during most months of the year. Cattle were sometimes housed; but little or no provision was made for their sustenance, as the grass is sufficient during the whole year. The Cowlitz Farm is in latitude 46 deg. 30 min. north, longitude 123 deg. west.

The guide procured by the superintendent for Captain Wilkes had been the coxswain of General Cass's canoe, when that belligerent senator performed a trip to the lakes in the North-west Territory. This guide had been for several years in Oregon. He left the company's service, married an Indian wife, and was living on a farm of about fifty acres, at the Cowlitz, independent and contented. Captain Wilkes says he "had seldom seen so pretty a woman as his wife; before her marriage she was the *belle* of the country, and celebrated for her feats of horsemanship."

The Cowlitz River takes its rise in the Cascade Range, near Mount Rainier.

* The crop of 1841 produced about 7000 bushels.

Its banks are tolerably high until it approaches the Columbia. It is only navigable even for boats at high water, in the spring and fall, at which time the supplies from Vancouver are sent up, and the wheat and other produce of the farm, in large flat barges. The soil along the river appeared to be of a good quality, a clayey loam with vegetable mould, overlaying trap rock and sandstone. The trees were chiefly poplars, white maple, ash, fir, pine, and cedar, with some laurel, where the prairies are flooded in the month of May.

It was reported that coal of good quality existed near the banks of the Cowlitz, but Captain Wilkes examined all the places that indicated its formation, and only found lignite. He observes,

“The route by the way of the Cowlitz will, in all probability, be that which will hereafter be pursued to the northern waters and sounds. Although there are many difficulties in crossing the rivers, &c., yet it is believed to be the most feasible course. On our way, we met with many canoes passing up loaded with salmon and trout, which had been taken at the Willamette Falls, and which they were then carrying to trade with the Indians for the *cammass root*.

“The Columbia, where the Cowlitz joins it, is a broad flowing stream, and was at this time much swollen. We had, after entering it, about forty miles yet to make, and it was past noon, but we glided briskly on with the current, although it was by no means so rapid as I had expected to have found it. Near the mouth of the Cowlitz is a high conical hill which has received the name of Mount Coffin, from its having been a burial-place of the Indians; and the remains of many of their coffins were still to be seen scattered over it. On the opposite side of the river is a high barrier of trap-rocks, covered with majestic pines.

“About ten miles lower down, we passed Oak Point, where the river turns nearly at right angles, taking its course along a barrier of trap-rocks, which it here meets on its west side, and which rises 800 feet perpendicularly above its surface. On the other side of the river is one of the remarkable prairies of the country covered with tall waving grass and studded with many oaks, from which the point takes its name. What adds additional interest and beauty to the scene is Mount St. Helen's, which may be seen from the sea when eighty miles distant; its height I made 9550 feet.

“In this part of the river, which I named St. Helen's reach, we met the brig Wave that had brought our stores from *Oahu*. By sunset we had reached Termination Island, and had yet twenty miles to make in a very dark night. We had already passed the only place where we could have encamped, and the natives showed extreme reluctance to go on. They soon desired to return, saying, that the night was very dark, and that the bay would be dangerous. This request was overruled, however, and we continued our course, though under apprehension of disaster. The Indians said that many canoes had been lost, and after

I became acquainted with this part of the river, I no longer wondered at their objections to pass over it at night; for if there is any wind, it becomes exceedingly rough and dangerous for their canoes.

"We found the water quite smooth, and glided on hour after hour without any appearance of a landing. I was at a loss to account for the length of our passage until I found the tide had been against us. We at last reached what the guide called Tongue Point, and afterwards kept skirting the shore for so long a time that I began to have misgivings that we should pass Astoria, and began firing muskets, the usual signal of an arrival. They were immediately answered by others from behind us, and the loud clamour of about forty yelping dogs. These sounds, although discordant, gave us the delightful assurance that we had reached our destination, and might now make our escape from the confined and irksome position we had been in a whole day. Mr. Birnie, the agent to the Hudson's Bay Company, met us at the landing, with lanterns and every assistance, and gave us a truly Scotch welcome. We soon found ourselves in his quarters, where, in a short time, a fire was burning brightly, and his hospitable board spread with good cheer, although it was past midnight. After partaking of the supper, blankets were furnished us, and we were made exceedingly comfortable for the night. In the morning, we had a view of the somewhat famous Astoria, which is any thing but what I should wish to describe. Half-a-dozen log-houses, with as many sheds and a pig-sty or two, are all that they can boast of, and even these appear to be going rapidly to decay. The company pay little regard to it, and the idea of holding or improving it as a post has long since been given up. The head-quarters of their operations have been removed to *Vancouver*, eighty miles further up the river, since which Astoria has merely been held for the convenience of their vessels. It boasts of but one field, and that was in potatoes, which I can, however, vouch for as being very fine. In former times it had its gardens, forts, and *banqueting-halls*; and, from all accounts, when it was the head-quarters of the North-west Company, during their rivalry with the Hudson's Bay Company, there was as jovial a set residing here as ever were met together. I have had the pleasure of meeting with several of the survivors, who have recounted their banquetings, &c."

ASTORIA.—"In point of situation, few places will vie with Astoria. It is situated on the south side of the Columbia River, eleven miles from Cape Disappointment, as the crow flies. From Astoria there is a fine view of the high promontory of Cape Disappointment, and the ocean bounding it on the west; the Chinook Hills and Point Ellice, with its rugged peak, on the north; Tongue Point and Katalamet Range on the east; and a high background, bristling with lofty pines to the south. The ground rises from the river gradually to the top of a ridge 500 feet in elevation. This was originally covered with a thick forest of pines; that part reclaimed by the first occupants is again growing up in

brushwood. From all parts of the ground the broad surface of the river is in view. The stillness is remarkable, and makes it evident that one is yet far more removed from civilised life; the distant, though distinct, roar of the ocean is the only sound that is heard, this, however, is almost incessant; for the stream though rushing onwards in silence to meet the ocean, keeps up an eternal war with it on the bar, producing at times scenes of great grandeur, but which, as we had already experienced, renders the bar wholly impassable for days together.

"The magnificent pine, so often mentioned by travellers, lies prostrate near the tomb of the hospitable chief Concomely, now in ruins. The chief's skull, it is believed, is in Glasgow, having been long since removed by Dr. Gardner.

"There were many things to remind us of home, among them was a luxuriant sward of white clover, now in full blossom, and numerous other plants that had found their way here; the trees were also familiar, and truly American. I felt that the land belonged to my country, that we were not strangers on the soil; and could not but take great interest in relation to its destiny, in the prospect of its one day becoming the abode of our friends and relatives."

The Columbia, opposite to Astoria, is about four miles wide, but in the middle of the river is an extensive sand-flat, with only a few feet water on it, and at low tides it is bare; the channel is very narrow on each side, and difficult to navigate. At Astoria there is only width for about ten or twelve vessels to ride at anchor. It is, therefore, unfit for an extensive seaport. A point of land extends about half a mile below the fort to where Young's River joins the Columbia, and forms the bay, on the banks of which Lewis and Clarke wintered.

Plumondon, the guide, who was also an expert trapper, informed Captain Wilkes, "That the country lying north of the Columbia, between the Cowlitz and Cape Disappointment, is generally rough and rugged, with numerous streams of water, and in many places a rich soil; it is extremely well timbered, and is capable, when cleared, of growing grain and other agricultural produce."

Captain Wilkes, on the 24th, accompanied the superintendent on a visit to the missionaries at Clatsop. They crossed Young's Bay, and, after walking a mile, came to the mission. The missionary and his wife gave them a kind welcome at their new wooden dwelling, which Captain Wilkes understood him to say had been built by the missionary's own hands. It is situated on light dry soil in front of a spruce and fir grove, which is thought to be the most healthy. There were also two American settlers, who were building houses here, both of them good mechanics. The place is not susceptible of much improvement, but was understood to have been chosen for its salubrity. Another missionary resided four miles distant, upon a tract of land, where he was chiefly occupied in raising a large crop and superintending cattle; there appeared to Captain Wilkes "to be little opportunity for exercising their ministerial calling, though he understood

afterwards, that at particular seasons a number of Indians collected to hear them."

After spending some time at the mission, they set off for Point Adams and Clatsop village; and he says, "I think in all my life, I had never met with so many snakes as I saw during this short walk; they were on the beach, where they were apparently feeding at low water. We looked from the sand-hills on Point Adams for vessels, but none were in sight; and then we walked on to the village. It consisted of few rough lodges, constructed of boards or rather hewn planks of large size; the interior resembled a miserably constructed ship's cabin, with *bunks*, &c.; the only light was admitted from above, near the ridge and gable end. Pieces of salmon and venison were hanging up in the smoke of their fire. Numbers of the Indians are always to be seen lounging about, and others gambling. On the *bunk*-planks were painted various uncouth figures of men, and in one was seen hanging the head of an elk, which it was understood they make use of occasionally as a decoy in the chase, for the purpose of taking their game more easily. Around the whole is a palisade, made of thick planks and joists, and fifteen feet in length, set with one end in the ground to protect them from attack."

The Indians of this region make war with each other on the most trivial occasions, chiefly to gratify individual revenge. The Hudson Bay Company's officers exert great influence in order to preserve peace. Inasmuch as it is safe for a white man to pass in any direction through those parts of the country in which their posts are established. In case of accident to a white settler, a war-party is at once organised by the company, and the offender hunted up. In 1840, an Indian was executed at Astoria for the murder of a white man, whom he came upon while asleep, killed, and stole his property.

On the Clatsop beach, Captain Wilkes saw a great number of dead fish, and was informed that they were thrown up in great multitudes during the autumn; and supposed to be killed by a kind of worm generated in their stomachs.

On the 28th, the company's barks, Cowlitz and Columbia, were discovered; the Columbia bound for *Oahu*, the Cowlitz for the Russian port of Sitka.

Captain Wilkes, on his Indians recovering from their fatigue, left Mr. Waldron at Astoria to await the arrival of the ship Peacock, and embarked on the Columbia to ascend to Fort Vancouver. The wind and waves were too boisterous for the canoe to venture across the open bay.

Tongue Point, a high bluff of trap-rock, covered with trees of large dimensions. "The top," says Captain Wilkes, "has been cleared and taken possession of by the superintendent of Astoria, who has erected a log-hut, and planted a patch of potatoes. The hut was inhabited for a year by a Sandwich Islander and his wife. It is rather a rough spot for cultivation, but the end of occupancy

was answered by it. There is a small portage on Tongue Point which canoes often use in bad weather, to avoid accidents that might occur in the rough seas that make in the channel that passes round it.

"We encamped a few miles above Oak Point, on the prairie, in a grove of trees. The next morning was beautiful, and the birds were singing blithely around us. Our Indians were as merry as the birds. There was an entire absence of game birds, though a great number of singing ones were seen. We passed during the day Coffin Rock, which is about seven miles above the Mount Coffin before spoken of. It is of small dimensions, and has been the burial-place of chiefs, who are usually interred in canoes, which are provided with all the necessary appendages for their journey to the land of spirits and their hunting-grounds. The mode of disposing of their dead seems to have been different on the south side of the Columbia. On the Cowlitz we observed many canoes near the bank of the river, supported between four trees; these contain the remains of their dead, are painted in a variety of figures, and have gifts from their friends hung around them. I was told that this is not only done at the time of their burial, but frequently for several months after."

The scenery before ascending to the lower mouth of the Willamette was diversified with high and low land. In the woods were frequently seen three lofty snowy peaks with many fine views. The country became more open, and appeared much better adapted to agriculture than lower down the Columbia.

CHAPTER XX.

HUDSON BAY COMPANY'S POSTS IN OREGON.

At Warrior Point, Captain Wilkes entered the *Callepuya*, for the purpose of avoiding the current of the strong Columbia. This branch forms a canal during the floods from a chain of lakes which extend to within a mile of Vancouver.

On their approach to the latter, they passed one of the dairies and some rich meadow-land, on which were grazing herds of cattle, and flocks of sheep of the best English and Spanish breeds.

FORT VANCOUVER.—"On landing within a mile of Vancouver, we walked to the fort by a road through a wood of large pines, and an undergrowth of various flowering shrubs. The old stumps in the road were overgrown with the red honeysuckle in full blossom. Lupins and other flowers grow over the roadway."

They entered at the back part of the village, which then consisted of "about fifty comfortable log-houses, placed in regular order on each side of the road. They are inhabited by the company's servants, and were swarming with chil-

dren, whites, half-breeds, and *pure* Indians. The fort stands at some distance beyond the village, and to the eye appears like an upright wall of pickets, twenty-five feet high; this encloses the houses, shops, and magazines of the company. The enclosure contains about four acres, which appear to be under full cultivation. Beyond the fort large granaries were to be seen. At one end is Dr. M'Laughlin's house, built after the model of the French Canadian, and one story weather-boarded and painted white. It has a piazza and some flower-beds with grape and other vines in front; between the steps are two old cannons on sea-carriages, with a few shot to speak defiance to the natives, who no doubt look upon them as very formidable weapons of destruction. I mention these as they are the only warlike instruments to my knowledge that are within the pickets of Vancouver, which differs from all the other forts in having no bastions, galleries, or loop-holes. Near by are the rooms for the clerks and visitors, with the blacksmith's and cooper's shops. In the centre stands the Roman Catholic chapel, and near by the flag-staff; beyond these again are the stores, magazines of powder, ware-rooms, and offices. He (Dr. M'Laughlin) is of Scotch parentage, but by birth a Canadian, enthusiastic in disposition, possessing great energy of character, and extremely well suited for the situation he occupies, which requires great talent and industry. He at once ordered dinner for us, and we soon felt ourselves at home, having comfortable rooms assigned us, and being treated as part of the establishment.

"The situation of Vancouver is favourable for agricultural purposes, and it may be said to be the head of navigation for sea-going vessels. A vessel of fourteen feet draft of water, may reach it in the lowest state of the river. The Columbia at this point makes a considerable angle, and is divided by two islands, which extends upwards of three miles to where the upper branch of the Willamette joins it.

"The shores of these islands are covered with trees, consisting of ash, poplars, pines, and oaks, while the centre is generally prairie, and lower than the banks; they are principally composed of sand. During the rise of the river in May and June, the islands are covered with water, that filters through the banks that are not overflowed. This influx renders them unfit for grain crops, as the coldness of the water invariably destroys every cultivated plant it touches.

"The company's establishment at Vancouver is upon an extensive scale, and is worthy of the vast interest of which it is the centre. The residents mess at several tables; one of the chief factor and his clerks; one of their wives (it being against the regulations of the company for their officers and wives to take their meals together); another for the missionaries; and another for the sick and Catholic missionaries. All is arranged in the best order, and I should think with great economy. Every thing may be had within the fort; they have an

extensive apothecary's shop, a bakery, blacksmith's and cooper's shops, trade-offices for buying, others for selling, others again for keeping accounts and transacting business; shops for retail, where the English manufactured articles may be purchased at as low a price, if not cheaper than in the United States, consisting of cotton and woollen goods, ready-made clothing, ship-chandlery, earthen and iron-ware, and fancy articles; in short, every thing and of every kind and description, including all sorts of groceries, at an advance of eighty per cent on the London prime cost. This is the established price at Vancouver, but at the other posts it is 100 per cent to cover the extra expenses of transportation. All these articles are of good quality, and suitable for the servants, settlers, and visitors. Of the quantity on hand some idea may be formed from the fact that all the posts west of the Rocky Mountains get their annual supplies from the depôt.

"Vancouver is the head-quarters of the north-west or Columbian department, which also includes *New Caledonia*; all the returns of furs are received here, and hither all accounts are transmitted for settlement. These operations occasion a large mass of business to be transacted at this establishment. Dr. Douglass, a chief factor, and the associate of Dr. M'Laughlin, assists in this department, and takes sole charge in his absence.

"Dr. M'Laughlin showed us our rooms, and told us that the bell was the signal for meals.

"Towards sun-set, tea-time arrived, and we obeyed the summons of the bell, when we were introduced to several of the gentlemen of the establishment; we met in a large hall, with a long table spread with abundance of good fare. Dr. M'Laughlin took the head of the table, with myself on his right, Messrs. Douglass and Drayton on his left, and the others apparently according to their rank. I mention this as every one appears to have a relative rank, privilege, and station assigned him, and military etiquette prevails. The meal lasts no longer than is necessary to satisfy hunger. With the officers, who are clerks, business is the sole object of their life, and one is entirely at a loss here who has nothing to do. The agreeable company of Dr. M'Laughlin and Mr. Douglass made the time at meals pass delightfully. Both of these gentlemen were kind enough to give up a large portion of their time to us, and I felt occasionally that we must be trespassing on their business-hours. After meals, it is the custom to introduce pipes and tobacco. It was said that this practice was getting into disuse, but I should have concluded from what I saw that it was at its height. Canadian French is generally spoken by the servants; even those who come out from England, after a while, adopt it, and it is not a little amusing to hear the words they use, and the manner in which they pronounce them.

"The routine of a day at Vancouver is, perhaps, the same throughout the year. At early dawn the bell is rung for the working parties, who soon after go to work;

the sound of the hammers, click of the anvils, the rumbling of the carts, with tinkling of bells, render it difficult to sleep after this hour. The bell rings again at eight for breakfast; at nine they resume their work, which continues till one; then an hour is allowed for dinner, after which they work till six, when the labours of the day close. At five o'clock on Saturday afternoon the work is stopped, when the servants receive their weekly rations.

"Vancouver is a large manufacturing, agricultural, and commercial depôt, and there are few, if any, idlers except the sick. Every body seems to be in a hurry, whilst there appears to be no obvious reason for it.

"Without making any inquiries, I heard frequent complaints made of both the quantity and quality of the food issued by the company to its servants. I could not avoid perceiving that these complaints were well founded, if this allowance were compared with what we deem a sufficient ration in the United States for a labouring man. Many of the servants complained that they had to spend a great part of the money they received to buy food; this is 17*l.* per annum, out of which they have to furnish themselves with clothes. They are engaged for five years, and after their time has expired, the company are obliged to send them back to England or Canada, if they desire it. Generally, however, when their time expires, they find themselves in debt, and are obliged to serve an extra time to pay it; and not unfrequently, at the expiration of their engagement, they have become attached, or married to some Indian woman, or half-breed, and have children, on which account they find themselves unable to leave, and continue attached to the company's service, and in all respects under the same management as before. If they desire to remain and cultivate land, they are assigned a certain portion, but are still dependent on the company for many necessities of life, clothing, &c.

"This causes them to become a sort of vassal, and compels them to execute the will of the company. In this way, however, order and decorum are preserved, together with steady habits, for few can in any way long withstand this silent influence. The consequence is, that few communities are to be found more orderly than that which is formed of the persons who have retired from the company's service. That this power, exercised by the officers of the company, is much complained of, I am aware, but I am satisfied that as far as the morals of the settlers and servants are concerned, it is used for good purposes. For instance, the use of spirits is almost entirely done away with. Dr. McLaughlin has acted in a highly praiseworthy manner in this particular. Large quantities of spirituous liquors are now stored in the magazines at Vancouver, which the company have refused to make an article of trade, and none is now used by them in the territory for that purpose. They have found this rule highly beneficial to their business in several respects; more furs are taken in consequence of those who are engaged having fewer inducements to err; the Indians are found to be less quarrelsome, and pursue the chase more constantly; and the settlers as far as I could hear, have been uniformly prosperous.

"In order to show the course of the company upon this subject, I will mention one circumstance. The brig, Thomas H. Perkins, arrived here with a large quantity of rum on board, with other goods. Dr. M'Laughlin, on hearing of this, made overtures immediately for the purchase of the whole cargo, in order to get possession of the whiskey or rum, and succeeded. The doctor mentioned to me, that the liquor was now in store, and would not be sold in the country, and added, that the only object he had in buying the cargo, was to prevent the use of the rum, and to sustain the temperance cause:

"The settlers are also deterred from crimes, as the company have the power of sending them to Canada for trial, which is done with little cost, by means of the annual expresses which carry their accounts and books.

"The interior of the houses in the fort are unpretending. They are simply finished with pine board panels, without any paint; *banks* are built for bedsteads; but the whole, though plain, is as comfortable as could be desired.

"Several of the American and other missionaries make Fort Vancouver for the most part their home, where they are kindly received and entertained, at no expense to themselves, by the governor. The liberality and freedom from sectarian principles of Dr. M'Laughlin may be estimated from his being thus hospitable to missionaries of so many Protestant denominations, although he is a professed Roman Catholic, and has a priest of the same faith officiating daily at the chapel. Religious toleration is allowed in its fullest extent. The dining-hall is given up on Sunday to the use of the ritual of the Anglican church, and Mr. Douglass, or a missionary, reads the service."

All the missionaries, except the Methodist, travelled across the Rocky Mountains: they represented the pass through them as by no means difficult, and that they had entertained no apprehension of the hostile Indians. They had accompanied a party of fur-traders from St. Louis, and gave a deplorable account of the dissipation and morals of the party. They were disappointed in finding self-support in Oregon, and had it not been for the hospitality of Dr. M'Laughlin, who took them in, they would have suffered much. They were then advised to settle on the Faultz Plains, where Captain Wilkes understood they had, since his departure, taken land, and succeeded in forming good farms.

There are two large entrance-gates to the "fort," for waggons and carts, and one in the rear leading to the granaries and the garden; the latter occupies four or five acres of ground, in which are grown all kinds of kitchen vegetables, and many varieties of fruit, with which the tables are abundantly supplied by the Scotch gardener. This gardener, after his first term of service, returned to England, and after visiting and making himself acquainted with the horticulture of Chiswick, meeting Dr. M'Laughlin accidentally in London begged to be sent back to Fort Vancouver, the garden of which he was ambitious should surpass that of the celebrated one at Chiswick.

Besides the store-houses there is also a large granary, of two stories high.

In addition to the other advantages, there are extensive kitchens and apartments for the half-breed and Indian children, whom the company have taken in order to bring up and educate. Of these latter there were twenty-three boys and fifteen girls. A teacher was employed for the boys, who superintended them not only in school but in the field and garden. During Captain Wilkes's stay an examination took place, and he observes, "Although the pupils did not prove very expert at their reading and writing, yet we had sufficient evidence that they had made some improvement, and were in a fair way to acquire the rudiments. Some allowance was to be made for the boys, who had been constantly in the field, under their teacher, for a few months past. Dr. M'Laughlin estimated the labour of four of these small boys as equal to that of one man. It was an interesting sight to see these poor little cast-away fellows, of all shades of colour, from the pure Indian to that of the white, thus snatched away from the vices and idleness of the savage. They all speak both English and French; they were also instructed in religious exercises, in which I thought they were more proficient than in their other studies. These they are instructed in on Sunday, on which day they attend divine worship twice. They were a ruddy set of boys, and when at work had a busy appearance. They had planted and raised six hundred bushels of potatoes; and from what Dr. M'Laughlin said to me, fully maintain themselves. The girls are equally well cared for, and are taught by a female, with whom they live and work.

"An opinion has gone abroad, I do not know how, that at this post there is a total disregard of morality and religion, and that vice predominates. As far as my observations went, I feel myself obliged to state that every thing seems to prove the contrary, and to bear testimony that the officers of the company are exerting themselves to check vice and encourage morality and religion in a very marked manner, and that I saw no instance in which vice was tolerated in any degree. I have indeed reason to believe, from the discipline and the example of the superiors, that the whole establishment is a pattern of good order and correct deportment.

"This remark not only extends to this establishment, but as far as our opportunities went (and all but two of their posts were visited), the same good order prevails throughout the country. Wherever the operations of the company extend, they have opened the way to future emigration, provided the means necessary for the success of emigrants, and rendered its peaceful occupation an easy and cheap task."

HUDSON BAY TRADE IN OREGON.—All the goods imported by the company into Oregon are divided into three classes, viz., articles of gratuity; those of trade; and those intended to pay for small services, labour, and provisions. The first consists of knives and tobacco; the second of blankets, guns, cloth,

powder, and shot ; the third of shirts, handkerchiefs, ribands, beads, &c. These articles are bartered at seemingly great profits, and many persons imagine that large gain must be the result from the Indian trade, but this is seldom the case. The Indians and settlers fully understand the value of each article. The company make advances to all their trappers if they wish to be sure of their services ; and from such a reckless set, there is little certainty of getting returns even if the trapper has it in his power. In fact, he will not return with his season's acquisition unless he is constrained to pursue the same course of life for another year, when he requires a new advance. In order to avoid losses by the departure of their men, the parties, some thirty or forty in number, are placed under an officer, who has charge of the whole. These are allowed to take their wives and even their families with them, and places where they are to trap during the season, on some favourable ground, are assigned to them. These parties leave Vancouver in October and return in May or June. They usually *trap* in shares, and the portion they are to receive is defined by an agreement the conditions of which depend very much on their skill. All the profits of the company depend upon economical management, for the quantity of peltry in this section of the country ; and indeed it may be said the fur-trade on this side of the mountains has fallen off fifty per cent within the last few years. It is indeed reported that this business, at present, is hardly worth pursuing.

Captain Wilkes was shown over the granary, which contained wheat, flour, barley, and buckwheat. The wheat averaged sixty-three pounds to the bushel ; barley yields twenty bushels to the acre ; buckwheat, in some seasons, gives a good crop, but it is by no means certain owing to the early frosts ; oats do not thrive well ; peas, beans, and potatoes yield abundantly ; little or no hay is made, the cattle being able to feed all the year round on the natural grass, which is very nutritious and they fatten upon it. The grass grows up rapidly in the beginning of summer, and the subsequent heat and drought actually convert it into hay, in which the juices are preserved. Besides this, they have on the prairies along the river two luxuriant growths of grass ; the first in the spring, and the second soon after the overflowing of the river subsides, which is generally in July and August. The last crop lasts the remainder of the season. Neither do they require shelter, although they are *penned* in at night. The *pens* are moveable, and the use of them is not only for security against the wolves but to manure the ground.

The farm at Vancouver is about *nine miles square*. On this they have two dairies, and milk upwards of one hundred cows. There are also two other dairies situated on *Werpauto* island on the Willamette, where they have one hundred and fifty cows, whose milk, under the direction of dairymen, is made into butter and cheese for the Russian settlements.

The company has likewise a grist and saw-mill, both well constructed, about six miles above Vancouver, on the Columbia River.

Captain Wilkes visited the dairy farm which lies to the west of Vancouver, on the *Callepuya*. This was one of the most beautiful. He rode to it through fine prairies, adorned with large oaks, ash, and pines. Large herds of cattle were feeding and reposing under the trees.

It is found advantageous to change the site of the dairy annually. The ground occupied the previous year is fertilised, and the new site affords the cattle better pasturage. The stock on the Vancouver farm amounted in 1841 to about three thousand head of cattle, two thousand five hundred sheep, and about three hundred brood mares.

Captain Wilkes found the whole establishment well managed by a Canadian and his wife. They churned the milk in barrel-machines, of which they had several. The cattle looked extremely well, and were rapidly increasing in numbers. The cows of the California breed yield but little milk, but when crossed with cattle from the United States and England, they greatly improve as milch cows. He saw some fine bulls that had been imported from England. He says, "The sheep have lambs twice a year" (?) Those of the California breed yield a very inferior kind of wool, which is inclined to be hairy near the hide, and is much matted. This breed has been crossed with the Leicester, and other breeds, which has much improved it. The fleeces of the mixed breed are very heavy, weighing generally eight pounds, and some as much as twelve. Merinos have been tried, but they are not found to thrive.

The Californian horses are not equal to those raised in Oregon; those bred near Walla-walla are in the most repute.

The number of posts occupied by the Hudson Bay Company in this territory is twenty-five; these are located at the best points for trade, and so as to secure the resort of the Indians, without interfering with their usual habits. Places are also occupied in the vicinity of their abodes during the most favourable part of the year, for obtaining the proceeds of their hunting. Captain Wilkes remarks, "This is regulated with much skill, and the portion of the country once under the care of the company is never suffered to become exhausted of furs; for, whenever they discover a decrease, the ground is abandoned for several years, until the animals have time to increase again.

The few posts which the company established in Northern California are of no importance. Some of the posts are situated far north behind the Russian settlements on the north-west coast.

"The trade and operations of the Hudson Bay Company are extensive, and the expense with which they are attended is very great. I am inclined to think that it is hardly possible for any one to form an exact estimate of the amount

of profit they derive from their business on the west side of the mountains. The stock of the company certainly pays a large dividend, and it is asserted, that in addition a very considerable surplus has been accumulated to meet any emergency, yet it may be questioned whether their trade in the Oregon territory yields any profit. The establishments are conducted at much less expense than formerly, owing to the provisions required being now raised in the country.

The Puget Sound Company, although it has been in operation for several years, had made no dividend up to 1841. The accumulations of their live stock is considered an augmentation of value. In the event, however, of the country becoming the abode of a civilised community, the farms or any other land possessed by this company must become very valuable, as the posts occupy all the points most favourably situated for trade, and the agricultural establishments have been placed in many of the best positions for farming operations. The utmost economy is practised in every part of the establishment of the Hudson Bay Company, and great exertions are made to push their operations over a larger field of action. Mercantile houses, supported by the credit and capital of the company, have even been established at the Sandwich Islands and San Francisco, where articles of every description imported in the vessels of the company may be purchased.

"The value of the furs obtained on this coast does not exceed 40,000*l.* annually; and when the cost of keeping up their posts, and a marine composed of four ships and a steamer is taken into account, and allowances made for losses, interest, and insurance, little surplus can be left for distribution. I am, indeed, persuaded, that the proceeds of their business will not long exceed their expenses, even if they do so at present. The statement of the company's affairs presents no criterion by which to judge of the success of their business on the north-west coast. It was the general impression among the officers that such has been the falling off in the trade, that it does not now much more than pay expenses. Captain Wilkes, on visiting the site of the old fort Vancouver, says,

"The view from this place is truly beautiful; the noble river can be traced in all its windings, for a long distance through the cultivated prairie, with its groves and clumps of trees: beyond, the eye sweeps over an intermediate forest, melting in a blue haze, from which Mount Hood, capped with its eternal snows, rises in great beauty. The tints of purple which appear in the atmosphere, are so far as I am aware, peculiar to this country. This site was abandoned, in consequence of the difficulty of obtaining water, and its distance from the river, which compelled them to transport every article up a high and rugged road.

"The company have a grist-mill, and the miller is both a millwright and watch-maker. There is also a powerful saw-mill, and boards and deals are sawed beyond those required, and shipped to the Sandwich Islands. The men employed at the mill were Canadians and Sandwich Islanders. Adjoining the saw-mill there is a

large smithy, in which is prepared the iron work required for mill work, and all the axes and hatchets used by the woodcutters and trappers. A trapper's success depends chiefly upon his axe, and if it should be lost or broken, he is compelled to relinquish his pursuit, and to return for another. About fifty axes can be manufactured in a day, and twenty-five are usually made, and like those used by the American labourers, are of excellent temper and quality. They are purchased by the Indians, and are made for them of a certain shape, somewhat like a *tomahawk*."

On one of the sheep-walks belonging to the company on the high prairie, which Captain Wilkes visited, the soil is a light sandy loam, which yields a plentiful crop of columbine, lupin, and cammass flowers. Throughout these upper prairies, in places are seen growing pines of gigantic dimensions and towering height, with their branches drooping to the ground, with clumps of oaks, elders, and maple. These prairies have such an air of being artificially kept in order, that they never cease to create surprise, and it is difficult to believe that the hand of taste and refinement has not been at work upon them. He observes,

"On our way back to Vancouver, we met the droves of horses and cattle that they were driving to the upper prairie on account of the rise of the river, and the consequent flooding of the low grounds. A certain number of brood mares are assigned to each horse; and the latter it is said, is ever mindful of his troop, and prevents them from straying. An old Indian is employed to watch the horses, who keeps them constant company, and is quite familiar with every individual of his charge. We reached the fort just at sunset, after a ride of twenty miles. The air was mild, and a pleasant breeze prevailed from the west. Mount Hood showed itself in all its glory, rising out of the purple haze with which the landscape was shrouded.

"The usual time for the highest rise of the river is in the middle of June.

"The crop of wheat of the last year had been partially destroyed by the floods, causing a loss of a thousand bushels.

"Although the Columbia does not overflow its banks anywhere except in the lower prairie, there are quicksands in these, through which the water, before it reaches the height of the embankment, percolates and rises on the low parts of the prairie. In consequence of the low temperature of the water, it chills and destroys the grain.

"I witnessed the Columbia at its greatest and least heights, and no idea can be formed of it unless seen at both these epochs. The flood is a very grand sight from the banks of the river at Vancouver, as it passes swiftly by, bearing along the gigantic forest trees, whose immense trunks appear as mere chips. They frequently lodge for a time, in which case others are speedily caught by them, which, obstructing the flow of the water, form rapids, until, by a sudden rush, the whole is borne off to the ocean, and in time lodged by the currents on some remote and savage islands,

to supply the natives with canoes. I also witnessed the undermining of large trees on the banks, and occasional strips of soil: thus does the river yearly make inroads on its banks, and changes in its channels.

“From the circumstance of this annual inundation of the river prairies, they will always be unfit for husbandry, yet they are admirably adapted for grazing, except during the periods of high water. There is no precaution that can prevent the inroad of the water. At Vancouver they were at the expense of throwing up a large embankment of earth, but without the desired effect. It has been found that the crop of grain suffers in proportion to the quantity of the stalk immersed: unless the wheat is completely covered, a partial harvest may be expected .

“The waters of the Columbia have no fertilising qualities, which is remarkable when the extent of its course is considered: on the contrary, it is said, to deteriorate and exhaust the soil. It is, when taken up, quite clear, although it has a turbid look as it flows by. Quantities of fine sand are, however, borne along, and being deposited in the eddies, rapidly form banks, which alter the channel in places to a great degree.”

During Captain Wilkes's visit at Vancouver, he was applied to by three of a party of eight young Americans, who were desirous of leaving the country, but could not accomplish it in any other way but by building a vessel. They were not dissatisfied with the territory, but they would not settle themselves down in it because there were no young women to marry, except squaws or half breeds. They informed him that they were engaged in building a vessel on the oak islands in the Willamette, where he promised to visit them on his way up the river.

CHAPTER XXI.

WILLAMETTE VALLEY.

On the 4th of June, 1841, Captain Wilkes left Fort Vancouver, and proceeded on an expedition up the valley of the Willamette river.

Dr. McLaughlin kindly procured him a large boat and provisions.

The barge in which Captain Wilkes embarked, was usually employed in carrying grain and other produce, but on this occasion was fitted up with seats and other conveniences as a passage boat. These boats are flat-bottomed, and capable of carrying about 300 bushels of wheat over a small draft of water; when well-manned, they are made to go as swiftly as canoes, and are extremely well adapted to the navigation of the river; they are provided with large tarpaulings to protect their cargo from the weather.

“From Vancouver,” says Captain Wilkes, “we floated down with the cur-

rent to the upper mouth of the Willamette, which we entered before night, and passed the encampment of the principal of the Methodist mission in Oregon, which was on its way to Clatsop, at the mouth of the Columbia.

“The musquitoes and sand flies were so annoying, that we were glad to seek for higher ground to encamp on, for the purpose of escaping them.

“The Willamette river is generally about one-fourth of a mile wide. For the distance of four miles from its entrance into the Columbia, its banks are low, and during the rise of the latter, are overflowed; its waters being backed into the Willamette. There is little current to contend with in this river during mid summer. After passing this low ground, the banks become high and precipitous, and are only in a few places susceptible of cultivation.

“We encamped on the island occupied by the young Americans, close to the place where they were building their vessel. The group of which it is one, is called the Oak Islands.

“The grove of oak on this island was beautiful, forming an extensive wood, with no undergrowth. The species that grows here is a white oak of very close grain. Its specific gravity is much greater than water; and it is used for the purposes to which we apply both oak and hickory. It makes excellent hoops for casks, and is the only timber of this region that is considered durable.

“The falls of Willamette are about twenty feet in height, and probably offer the best mill sites for any place in the neighbouring country. Being at the head of navigation for sea vessels, and near the great wheat-growing valley of Willamette, it must be a place of great resort. A Mr. Moore, from the western states, whom I saw on the Willamette, informed me that he had taken possession of the west side of the falls, under a purchase from an old Indian chief. Whether such titles will be recognised by the government, is already a matter of speculation in the country; and there is much talk of pre-emption rights, &c.

“At the time of our visit to the falls, the salmon fishery was at its height, and was to us a novel as well as an amusing scene. The salmon leap the fall; and it would be inconceivable, if not actually witnessed, how they can force themselves up, and after a leap of from ten to twelve feet, retain strength enough to stem the force of the water above. About one in ten of those who jumped would succeed in getting by. They are seen to dart off the foam beneath, and reach about two-thirds of the height, at a single bound: those that thus passed the apex of the running water, succeed; but all that fall short, were thrown back again into the foam. I never saw so many fish collected together before; and the Indians are constantly employed in taking them. They rig out two stout poles, long enough to project over the foaming cauldron, and secure their larger ends to the rocks. On the outer end, they make a platform for the fisherman to stand on, who is perched on it with a pole, thirty feet long, in hand, to which the net is fastened by a hoop, four feet in diameter: the net is made to slide on

the hoop, so as to close its mouth when the fish is taken. The mode of using the net is peculiar : they throw it into the foam as far up the stream as they can reach, and it being then quickly carried down, the fish who are running up in a contrary direction, are caught. Sometimes twenty large fish are taken by a single person in an hour ; and it is only surprising that twice as many should not be caught."

The Willamette river, at the falls, is 350 yards wide. The height of the fall about twenty-five feet.

The number of Indians at the Willamette falls during the fishing season, is about seventy, including all ages and sexes : there are others who visit the falls in canoes for fish, which at times will raise the number to not far from 100.

Those fish which are unable to get up, remain some time at the falls, very much exhausted, and finally resort to the smaller streams below.

The rocks above the falls change their character. Much volcanic scoria, vesicular lava, and pudding-stone, intermingled with blocks of trap, and many crystals of quartz occur. On the rocks are to be seen large knots of lamprey eels, worming themselves up, which look at a little distance as if alive with snakes.

Above the falls, in crossing the river, they passed through an Indian village, " which was absolutely swarming with fleas ; a filthier place cannot be found in Oregon." Above the falls, the current was strong, and they made but little headway ; and the boatmen, in order to take advantage of the smallest eddies, crossed and recrossed the river. The banks became much higher and more picturesque, and this part of the Willamette is considered dangerous when the floods are high, and accidents frequently occur.

Before night, they encamped above " the Stony Islands," on a barren point of land, at some height above the river. Here they found various mosses in flower.

" At this season of the year," Captain Wilkes observes, " the river is not high ; its rise usually takes place in February and March, when it becomes very much swollen, and with its tributaries does much damage. These floods, however, are of very short duration, for the descent is so rapid that the waters are soon discharged. It was raining quite hard when we passed Camp Maude du Sable, a sandy point just at the opening out of the Willamette valley, which was one of the points originally occupied when the river was first explored by the whites. About two miles further up, the river is Champooing, eighteen miles above the falls, which we reached at about four P. M. Here we found a few log-houses, one of which belonged to a Mr. Johnson, who gave us a hearty welcome. He was formerly in the navy, then a trapper in the Hudson Bay Company's service, but had commenced farming on the Willamette, and taken to himself an Indian girl for a wife, by whom he had several children. He had them educated. His wife was extremely industrious, making and mending, and taking care of the

household concerns, and is rather pretty. Johnson's estimate of her," says Captain Wilkes, "was that she was worth about half-a-dozen civilised wives. There was little cleanliness, however, about his house, and many of the duties were left to two young male slaves, of Indian blood, but of what tribe I did not learn. Johnson's farm consists of about forty acres under cultivation; his wheat and potatoes were flourishing, and he had a tolerable kitchen-garden. He has some little stock, but complained much of the Oregon tiger, or American panther. These voracious animals are numerous and bold; the night before we arrived, they had entered the pen and killed a calf regardless of the dogs.

"We were informed that there are plenty of elk and deer, and that the grizzly bear is also common. The flesh of the latter animal is very much esteemed. Wild ducks and geese are numerous in the spring and fall, covering the rivers, lakes, and ponds."

One of Johnson's neighbours, was an old man by the name of Cannon, who had been one of the party with Lewis and Clarke, and was, from his own account, the only remaining one in the country. Another, old Moore, who taught Johnson's children, possessed much information in relation to the country he had passed through. He had crossed the mountains the year before, and said he found no difficulty in making the trip. The great drawback to the country on the route up the Willamette, is the want of wood.

Captain Wilkes, having found an intelligent guide, and having mounted on horseback, rode up the Willamette valley. He passed many small farms of from fifty to one hundred acres, belonging to the old servants of the Hudson Bay Company, Canadians who had settled here; they all appeared very comfortable and thriving. "We stopped," says Captain Wilkes, "for a few hours at the Catholic mission, twelve miles from Champooing, to call upon the Rev. Mr. Bachelét, who is here settled among his flock, and is doing great good to the settlers in ministering their temporal as well as spiritual wants.

"Annexed to his house is a small chapel, fully capable of containing the present congregation. They are erecting a large and comfortable house for Mr. Bachelét, after which it is intended to extend the chapel. These houses are situated on the borders of an extensive level prairie, which is very fertile, having a deep alluvial; they also have near them a forest of pine, oak, &c. They are now occupied in turning of the fields for the first time. Mr. Bachelét informed me that it was intended to take enough of land under cultivation to supply a large community that will be attached to the mission; for it is the intention to establish schools here for the instruction of the Indians, as well as the Canadians and other settlers. He has already ten Indian children under his care. The mission had been established about a year, and it had already done much good. When he first arrived, all the settlers were living with Indian women whom they had since married. This was the first step he had taken towards their moral im-

provement, and he had found it very successful. There were about thirty Canadian families settled here, besides about twenty persons who have no fixed residence and are labourers. The number of Indians is estimated at between 400 and 500 including all tribes, sexes, and ages. The district under Mr. Bachelét's superintendence, takes in about fifty square miles, including the Willamette valley, Faulitz and Yam Hill Plains, and extending below the Willamette falls, as far as the Klackamus River. The number of white residents, including the missionaries of both denominations, is thought to be about sixty."

Captain Wilkes dined with Mr. Bachelét on oatmeal porridge, venison, strawberries, and cream.

Soon after leaving, the party arrived at where some American and English had settled; and entered on the grounds of the Methodist mission. Here were the log-houses which were built when they first settled here; and in the neighbourhood, the wheelwrights' and blacksmiths' workshops, belonging to the mission; and the hospital, built by Dr. White, who was formerly attached to the mission. It was still used as a residence for some of the missionaries, and is said to be the best building in Oregon.

"This place," says Captain Wilkes, "seemed an out-of-the-way place to find persons of delicate habits struggling with difficulties such as they have to encounter, and overcoming them with cheerfulness and good-temper. Near the hospital are two other houses, built of logs, in one of which Dr. Babcock, the physician of the mission, lives. He stated that the country was healthy, although during the months of August and September, they were subject to fever and ague on the low grounds, but in high and dry situations, he believed they would be free from it. A few other diseases existed, but they were of a mild character, and readily yielded to simple remedies.

"The lands of the Methodist mission are situated on the banks of the Willamette River, on a rich plain adjacent to fine forests of oak and pine. They are about eight miles beyond the Catholic mission, eighteen miles from Champooing, in a southern direction. Their fields are well enclosed, and we passed a large one of wheat, which we understood was *self*-sown by the last year's crop, which had been lost through neglect. The crop so lost amounted to nearly 1000 bushels, and it is supposed that this year's will yield twenty-five bushels to the acre. About all the premises of this mission crop, there was an evident want of the attention required to keep things in repair, and an absence of neatness that I regretted much to witness."

The next day, Captain Wilkes visited "the Mill," distant about nine miles, in a southern direction. They passed in the route several prairies, both high and low. The soil on the higher was of a gravelly or light nature, while on the lower it was a dark loam, intermixed with a bluish clay. "The prairies are at least one-third greater in extent than the forest; they were again seen carpeted

with the most luxuriant growth of flowers, of the richest tints of red, yellow, and blue, extending in places a distance of fifteen to twenty miles. The timber we saw consisted of the live and white oak, cedar, pine, and fir. We reached 'the mill' by noon, which consists of a small grist and saw-mill on the borders of an extensive prairie. They are both under the same roof, and are worked by a horizontal wheel.

"During the whole summer both mills are idle for want of water, the stream on which they are situated being a very small one, emptying into the Willamette. We found here two good log-houses, and about twenty lay members, mechanics of the mission. There are, besides, about twenty-five Indian boys, who, I was told, were not in a condition to be visited or inspected. Those whom I saw were nearly grown up, ragged, and half-clothed, lounging about under the trees. Their appearance was any thing but pleasing and satisfactory; and I must own I was greatly disappointed, for I had been led to expect that order and neatness, at least, would have been found among them, considering the *strong force* of missionaries engaged here.

"The missionaries, as they told me, have made individual selections of lands to the amount of 1000 acres each, in prospect of the whole country falling under our laws.

"I rode about two miles to the situation selected by the Rev. Mr. Hines. We found him and family encamped under some oak-trees, in a beautiful prairie, to which place he had but just removed: he intended putting up his house at once, and they had ordinary comforts about them."

He dined, on his return, with the secular superintendent, on salmon, pork, potted cheese, strawberries and cream, nice hot cakes, &c.

The number of Indians within the limits of this mission, are, at Nisqually, 200; Clatsop, 209; Chinooks, 220; Kilamukes, 400; Callapuyas, 600; Dalles, 250: in all this district, about 2000 Indians. This field is in part occupied by the Catholics.

"Of these," says Captain Wilkes, "the Methodist missionaries have under their *instruction*, if so it may be called, twenty-five at the Willamette station; at the Dalles, and occasionally on the Klackamus River, are the only places where divine service is attempted.

"I cannot but believe that the same labour and money which have been expended here, would have been much more appropriately and usefully spent among the tribes about the Straits of Juan de Fuca, who are numerous and fit objects for instruction."

The river at the site of the old mission on the banks of the Willamette, makes a considerable bend, and has undermined and carried away its banks to some extent: a short distance beyond it is making rapid inroads into the rich soil of these bottom lands.

"This is the usual place of crossing the river, which is too deep to be forded, and about 200 yards wide. Its banks were twenty feet high, and composed of stratified layers of alluvium.

"On the shore of the river which consists of a shingle beach, some 200 feet wide, are to be found cornelians, agates, and chalcedony, among the loose pieces of basalt of which it is composed. The current was found to run at the rate of three miles an hour, although the water was said to be low. An old canoe was procured, in which we passed over, while one of the horses was led, and swam by its side. Here we met George Gay, who was travelling with his Indian wife; he told us that he would join us in our trip to the Yam Hills, which we proposed to make the next day.

"We found our camp established by Plumondon (a trapper), near the residence of a Mr. O'Neill,* about a mile from the river, in a pretty oval prairie, containing about 300 or 400 acres, with a fine wood encircling it. Sixty of these are under cultivation: about forty in wheat, that was growing luxuriantly.

"This farm is the best we have seen, in every respect; and it is not only well arranged, but has many advantages from its location.

"The next day (9th of June), we started for the *Yam Hills*, which divide the valleys of the Willamette and Faulitz. They are of but moderate elevation; the tops are easily reached on horseback, and every part of them which I saw, was deemed susceptible of cultivation. The soil is a reddish clay, and bears few marks of any wash from the rains. These hills are clothed to the very top with grass, and afford excellent pasturage for cattle, of which many were seen feeding on them. On our route through the Yam Hills, we passed many settlers' establishments. From their top the view is not unlike that from Mount Holyoake, in Massachusetts, and the country appears as if it were as much improved by the hand of civilisation. The oak trees sprinkled over the hills and bottoms have a strong resemblance to the apple orchards. The extent of country we looked over is from twenty-five to thirty miles, all of which is capable of being brought to the highest state of cultivation. There are, in truth, few districts like that of the valley of Faulitz.

"We passed one or two brick-kilns, and finally reached the new residence of

* Three years since O'Neill came to the valley with only a shirt to his back, as he expressed it: he began by working part of this farm, and obtained the loan of cattle and other articles from Dr. McLaughlin, all of which he has, from the natural increase of his stock and out of his crops, since repaid. He has bought the farm, has 200 head of stock, horses to ride on, and a good suit of clothes, all earned by his own industry; and he says it is only necessary for him to work one month in the year to make a living: the rest of the time he may amuse himself. He spoke in the highest terms of Dr. McLaughlin, and the generous aid he had afforded him in the beginning.

The success of O'Neill is a proof of what good education and industrious habits will do, and it is pleasing to see the happiness and consideration they produce. Mr. O'Neill is also a mechanic, and has gained much of his wealth in that way: he ploughs and reaps himself, and is assisted by a few Indians, whom he had the tact to manage. He has a neat kitchen-garden, and every thing that a person in his situation can desire.

George Gay, one of the most remote on this side the river. He had reached home with his wife and two children not long before us.

"On our return towards the wood, we passed the farm of one of Dr. McLaughlin's sons, who has settled here, and has an extensive portion of the prairie fenced in. This part of Willamette valley is a prolonged level of many miles in extent, circumscribed by the woods, which have the appearance of being attended to, and kept free from undergrowth. This is difficult to account for except through the agency of fire destroying the seeds. The Indians are in the habit of burning the country yearly, in September for the purpose of drying and procuring the seeds of the sunflower, which they are thus enabled to gather with more ease, and which form a large portion of their food. That this is the case appears more probable from the fact, that since the whites have had possession of the country, the undergrowth is coming up rapidly in places.

Of the different settlers in the valley of the Willamette, Captain Wilkes says, "Those of French descent appeared the most happy, contented, and comfortable; while those of Anglo-Saxon race manifested the go-a-head principle of the American citizens.

The Willamette River sometimes rises suddenly thirty feet perpendicular. He crossed the Yam Hills to the Faulitz plains. The hills on the way were covered with wall-flowers, lupins, and ripe strawberries. The cattle brought to this valley were originally from San Francisco; and were increasing rapidly in numbers, no care being taken of them but driving them into the pens for security during the night. On returning down the Willamette valley, they found salt springs, to which cattle and game resort in great numbers. The inhabitants on the Willamette stated to him, that they could obtain abundance of food for the year from the pastures, and the growing of wheat being little more than one month's labour. In fact, that they might pass in idleness at least two-thirds of the year. The climate was, however, complained of as too wet for growing Indian corn, though excellent for pasturage.

Captain Wilkes observes, "In speaking of the Willamette valley, I have viewed its advantages for raising crops, pasturage of stock, and the facilities of settlers becoming rich. There is, however, one objection to its ever becoming a large settlement, in consequence of the interruption of the navigation of its rivers in the dry season; which renders it difficult to get to a market, as well as to receive supplies.

SALMON FISHERY.—The salmon fishery affords abundant food at a very low price, and of excellent quality: it does not extend above the falls. He found it impossible to obtain any data to found a calculation of the quantity taken, but estimated it at 800 barrels. The finest of the salmon are those caught nearest the sea. "The settlers and Indians," he says, "told us that the salmon, as they pass up the river, become poorer, and when they reach the tributaries of

the Upper Columbia, they are exceedingly exhausted, and have their bodies and heads much disfigured and cut, and their tails and fins worn out by contact with the rocks. Many of the salmon, in consequence, die; these the Indians are in the habit of drying for food, by hanging them on the limbs of trees. This is to preserve them from the wolves, and to be used in time of need, when they are devoured, though rotten and full of maggots. The fish of the upper waters are said to be hardly edible, and, compared with those caught at the mouth of the Columbia are totally different in flavour. The latter are the richest and most delicious fish I ever recollect to have tasted: if any thing, they were too fat to eat, and one can perceive a difference even in those taken at the Willamette falls, which, however, are the best kind for salting. There are four different kinds of salmon which frequent this river in different months; the latest appears in October, and is the only one that frequents the Cowlitz river. The finest sort is a dark silvery fish, of large size, three or four feet long, and weighing forty or fifty pounds. There is one point which seems to be still in doubt, namely, where the spawn of this fish is deposited. It is asserted, and generally believed, that none of the old fish ever return to the sea again. It has not been ascertained whether the young fry go to the ocean: and if they do so, whether as spawn or young fish."

On returning to Vancouver, Captain Wilkes found that Mr. Ogden, the Hudson Bay agent in the north, had arrived with his voyageurs. That gentleman had then been thirty-two years in the territory, and possessed much information respecting it, having travelled nearly all over it. He resides at Fort St. James, on Stuart's lake, and has six posts under his care.

The northern section of the country he represented "as not susceptible of cultivation on account of the proximity of the Snowy Mountains, which causes sudden changes, even in the heat of summer, that would destroy the crops. His posts are amply supplied with salmon from the neighbouring rivers, which flow down into the sounds on the coast. These fish, when dried, form the greatest part of the food of those employed by the company during the whole year. Their small stores of flour, &c., are all carried up the country from Colville to Vancouver. Furs, which are more abundant in the northern region, and are purchased at lower prices from the Indians." The return this year (1841), brought down by Mr. Ogden, was valued at 100,000 dollars, which he informed Captain Wilkes was much less than the usual amount. The southern section of Oregon, he was informed, scarcely repaid the expense of an outlay for a party of trappers. "The southern country is, however," says Captain Wilkes, "well adapted to the raising of cattle and sheep; of the former many have been introduced by parties, which trap on their way thither, and return with cattle. Although there were but a few heads of them four or five years before, in 1841 there were upwards of 10,000. The whole country is particularly adapted to grazing, which,

together with the mildness of the climate must cause this region to become, in a short time, one of the best stocked countries in the world. The price of cattle may be quoted at ten dollars a head ; but those that are broken in for labour, or milch cows, command a higher price ; and in some places in the Willamette valley, they have been sold for the enormous price of eighty dollars. Every endeavour is made to keep the price of cattle up, as labour is usually paid for in stock. The price of labour for a mechanic may be set down at from *two dollars and a half* to *three dollars* a day ; and there is much difficulty to procure them even at that rate. The wages for a common labourer is one dollar per day. The price of wheat is fixed at sixty-two cents and a half (about 2s. 6d.) per bushel, by the company, for which any thing but spirits may be drawn from the stores, at the low advance of fifty per cent on the London cost. This is supposed, all things taken into consideration, to be equal to one dollar and twelve cents per bushel ; but it is difficult for the settlers so to understand it, and they are by no means satisfied with the rate. There is a description of currency in the country called *beaver money* ; which seems to be among the whites what blankets are among the Indians. The value of the currency may be estimated from the fact, that a *beaver skin* represents about *two dollars* throughout the territory."

On leaving Vancouver Captain Wilkes speaks in the highest terms of the kind hospitality received by him and his party from Dr. McLaughlin. The river had swollen rapidly by the flowing down of the mountain torrents, and Captain Wilkes says :—

" On reaching the river, we found one of Mr. Ogden's boats manned by fourteen voyageurs, all gaily dressed in their ribands and plumes ; the former tied in large bunches of divers colours, with numerous ends floating in the breeze. The boat was somewhat of the model of our whale-boats, only much larger, and of the kind built expressly to accommodate the trade ; they are provided yearly at Okonagan, and are constructed in a few days ; they are clinker-built, and all the timbers are flat. These boats are so light that they are easily carried across the portages. They use the gum of the pine to cover them instead of pitch."

Captain Wilkes and Mr. Ogden embarked together in this boat. On a signal being given, they shoved off into the stream, and the voyageurs immediately commenced singing one of their boat-songs. After paddling up the stream for some distance, they made a graceful sweep to reach the centre, and then passed downwards past the spectators with great animation.

" The boat," says Captain Wilkes, " and voyageurs seemed a fit object to grace the wide-flowing river. On we merrily went, while each voyageur in succession took up the song and all joined in the chorus. In two hours and a half, we reached the mouth of the Cowlitz, a distance of thirty-five miles.

" In ascending the Cowlitz, we found a strong current to contend against,

and by nightfall had only proceeded twelve miles further. As we encamped, the weather changed, and rain began to fall, which lasted till next morning.

"On the second day, our voyageurs had doffed their finery, and their hats were carefully covered with oiled skins. They thus appeared more prepared for hard work. The current became every mile more rapid, and the difficulty of surmounting it greater. The management of the boats in the rapids is dexterous and full of excitement, as well to the passengers as to the voyageurs themselves. The bowman is the most important man, giving all the directions, and is held responsible for the safety of the boats; and his keen eye and quick hand in the use of his paddle, delights and inspires a confidence in him in moments of danger that is given without stint. We did not make more than ten miles during the day, and were forced to encamp three miles below the farm. On the 19th, we reached our destination. On our approach, although there were no spectators except a few Indians, to be expected, the voyageurs again mounted their finery, and gaily chaunted their boat song.

"Mr. Ogden informed me that he has seen the whole country inundated by the rise of the river. This, however, can but rarely occur, and could only be the result of a sudden melting of the snows when accompanied with violent rain-storms. I visited, with Mr. Ogden, the Catholic mission and several of the settlers' houses. The neighbourhood, though consisting of few families, appear very happy and united. They prefer the Cowlitz to the Willamette, although the land is not so good as in the valley of the latter; but they say that many vegetables succeed here, that will not grow on the Willamette.

"We rode up to the Indian lodges, near the Chickeeles River, in order to engage some of them to accompany us. I noticed the excessive propensities that the whole Indian population seem to have for rum; many of these poor creatures would labour for days, and submit to all sorts of fatigue, for the sake of a small quantity. No other inducement would move them in the salmon and *cammass* seasons, for then they have abundance and nothing to desire, but the stimulating liquid."

Towards night they encamped on a small prairie, or mount, with flowers and detached trees.

The Indians on the Chickeeles River were engaged in the salmon-fishery. Their method of taking the fish is by staking the river across with poles, and constructing pikes, or fish-holes, through which the fish are obliged to pass. Over these are erected triangles to support a stage, on which the Indians stand with nets and spears, and take the fish as they attempt to pass through; the fish are then dried by smoking, and prepared for future use. The smoked fish are packed in baskets, but the supply is usually not sufficient for their wants.

At Vancouver, they use the river in preference to the well-water, though they do not consider the latter as unwholesome.

Excellent spotted trout are abundant in the ponds.

Captain Wilkes then returned to Nisqually. "Fully as much," he says, "enchanted with the beautiful park-scenery as when I passed it before. To it was now added additional peeps of Mount Rainier's high and snowy peaks."

CHAPTER XXII.

EXPEDITION TO WALLA-WALLA.

It having been decided to explore the Walla-walla Valley and River as an important part of Oregon, preparations were made to execute that object; and Mr. Ogden agreed to carry in his boats the party up the Columbia, as far as the mouth of the Walla-walla. These boats have great strength and buoyancy, carry three tons' weight, and have a crew of eight men, besides a *padroon*, or master; they are thirty feet long, and five feet and a half beam, sharp at both ends, clinker-built, and have no knees. In building them, flat timbers of oak are built to the requisite shape by steaming; they are bolted to a flat keel at distances of a foot from each other; the planks are of cedar, and generally extend the whole length of the boat. The gunwale is of the same kind of wood, but the rowlocks are of birch. The peculiarity in the construction of these boats is, that they are only rivetted at each end with a strong rivet, and being well gummed, they have no occasion for nailing. They answer, and, indeed, are admirably adapted to, all the purposes for which they are intended; are so light as to be easily transported over the portages by their crews, and in case of accident easily repaired.

The goods embarked for the supply of the northern ports are all packed up in bales of ninety pounds each, and each consists of parcels of groceries, clothing, flour, powder, bullets, &c. The equal division of weight is necessary, in consequence of the numerous portages they have to make, as well as convenient in forming packs for horses, which they take at Okonagan for a journey to Thompson River, which takes twenty days to accomplish.

Mr. Ogden is generally six months of every year to and from his post on the south end of Stuart's Lake, called Fort St. James, in latitude 54 deg. north. He leaves it early in the spring, and returns in the fall of each year. Before he departs, he fits out his summer trappers, and, on his return; those for the winter's campaign. He brings down with him the produce of a year's hunting. This post is the most profitable of all the sections west of the Rocky Mountains. The average cost of a beaver-skin is about twenty-five cents, and when it reaches Vancouver, it has enhanced in price to two dollars and fifty cents. The amount of furs brought down by Mr. Ogden yearly, will nett in London 50,000*l*.

In setting out on his journey, Mr. Ogden's practice, as well as that of all the company's parties, is to go only a few miles the first day, in order that they may discover if any thing has been neglected, and be able to return for it. For this reason, their first encampment was at the saw-mill. Their brigade consisted of nine boats rowed by sixty voyageurs, eight of whom had their Indian wives with them. Besides these, were Mr. and Mrs. M'Kinley (Mr. Ogden's son-in-law), who was to take charge of the Walla-walla Fort, and a Mr. Cameron, also of the company, who was on his way to Mr. Black's station. The boats take each sixty packages, excepting the trader, which is Mr. Ogden's own boat, and carries only forty. The boatmen are Canadians, excepting about one-fourth, who are Iroquois Indians, all strong, active, and hardy men. They are provided also with a square sail, as the wind blows generally either directly up or down the river.

On the 27th of June, they set off at early dawn, took their breakfast at Prairie du Thé, and reached the company's fishery, at the Cascades, at six P.M., where they encamped. This is the head of ship-navigation, where the river takes a turn northward, and for upwards of two miles is comparatively narrower, 450 yards wide. It falls in this distance about forty feet, and the whole body of water drives through the channel with great impetuosity, forming high waves and fearful whirlpools too dangerous to be encountered by boats. When the river is low, these rapids are sometimes passed by skilful boatmen, but there have been many lives lost in the attempt.

The country bordering on the river is low until the Cascades are approached, with the exception of several high basaltic bluffs. Some of them are 200 feet high, pointed like turreted castles.

The Columbia, at this part, passes through the Cascade range of mountains, between high and rocky banks. The geological character of this range is basaltic lava, basaltic conglomerate, and sand-stone. Large quantities of petrified wood are to be found in the neighbourhood. Mr. Drayton obtained specimens of all these.

The river thus far is navigated by seeking out the eddies. The great difficulty is found in doubling the points, which are, at times, impassable, except by tracking and poling. The oars are used after the French or Spanish fashion, adding the whole weight of the body to the strength of the arm.

At the Cascades, during the fishing season, there are about 300 Indians, only about one-tenth of whom are residents; they occupy three lodges; but there was formerly a large town here. Great quantities of fish are taken by them; and the manner of doing this resembles that of the Willamette Falls. They also construct canals, on a line parallel with the shore, with rocks and stones for about fifty feet in length, through which the fish pass in order to avoid the strong current, and are here taken in great numbers.

There are two portages here, under the names of the new and the old. At

the first only half of the load is landed, and the boats are tracked up for half a mile further, when the load is again shipped. The boats are then tracked to the portage. A strong eddy occurs at this place which runs in an opposite direction; and here it is necessary to land the whole of the cargo; after which the empty boats are again tracked three-quarters of a mile beyond.

To a stranger unacquainted with the navigation of this river, the management of these boatmen is wonderful; for it is surprising how they can succeed in surmounting such rapids at all, as the Cascades. Their mode of transporting the goods, and the facilities with which they do it, are equally novel. The load is secured on the back of a voyageur by a band which passes round the forehead and under and over the bale; he squats down, adjusts his load, and rises with ninety pounds on his back; another places ninety pounds more on the top, and off he trots, half-bent, to the end of the portage. One of the party had seen a voyageur carry six packages of ninety pounds each on his back (540 pounds); but it was for a wager, and the distance was not more than 100 yards. The voyageurs in general had not the appearance of being very strong men. At these portages, the Indians assist for a small present of tobacco. The boats seldom escape injury in passing; and in consequence of that which they received on this occasion, the party was detained the rest of the day repairing damages.

A short distance above the Cascades, they passed the sunken forest, which was at the time entirely submerged.

On the 30th of June they had a favourable wind, but it blew so hard that they were obliged to reef their sail, and afterwards found the waves and wind too heavy for them to run without great danger. They, in consequence, put on shore to await until it abated. In these forty miles of river it usually blows a gale from the westward in the summer season, almost daily.

In the evening they reached within seven miles of the Dalles, and four below the mission. Here the roar of the water at the Dalles was heard distinctly.

The country had now assumed a different aspect; the trees began to decrease in number, and the land to look dry and burnt up.

Before pitching their tents, the men went beating about the bushes to drive away the rattlesnakes, a number of which were killed, and preserved as specimens.

In the morning they were again on their route, and reached Little River, from which the station of the Methodist mission is three-fourths of a mile distance.

The mission consists of two log and board houses, hewn, sawed, and built by themselves, with a small barn, and several out-houses. The buildings are situated on high ground, among scattered oaks, and immediately in the rear is an extensive wood of oaks and pines, with numerous sharp and jagged knolls and obelisk-looking pillars of conglomerate, interspersed among basaltic rocks; in front is an alluvial plain, having a gradual descent towards the river, and extending to the

right and left. This plain comprises about 2000 acres of good land, well supplied with springs, with Little River, and other smaller streams flowing through it. The soil consists of decomposed conglomerate. In some places there appeared deep black loam. Around this tract the land is high, devoid of moisture, and covered with basaltic rocks or sand.

They have raised wheat and potatoes by irrigation: the latter grown in great perfection, yield twenty to thirty bushels to the acre. They had just gathered a crop of 200 bushels from land which they irrigated by means of several fine streams near their houses.

The summers here are much hotter than at Vancouver, and consequently drier; the spring rains cease earlier, and the harvest begins in June.

There are only a few Indians residing near the mission during the winter, and these are a very miserable set, who live in holes in the ground, not unlike a clay oven. They are too lazy to cut wood for their fires. The number that visit the Dalles during the fishing season is about 1500; these are from all the country round, and are generally the outlawed of the different villages. The missionaries complain much of the insolent behaviour and of the thieving habits, both of the visitors, and those who reside permanently at the falls. They are, therefore, very desirous of having a few settlers near, that they may have some protection from this annoyance, as they are frequently under apprehension that their lives will be taken.

The river between the Cascades and the Dalles, a distance of forty miles, has no rapids, and is navigable for vessels drawing twelve feet of water. It flows through high rocky banks of basalt.

The missionaries informed Mr. Drayton, that the salmon fishery at the Dalles lasted six months, and that sturgeon are taken during the greater part of the year.

The Dalles is appropriately called the Billingsgate of Oregon. The diversity of dress among the men was greater even than in the crowds of natives which Captain Wilkes saw at the Polynesian islands; but, he says, they lack the decency and care of their persons which the islanders exhibit. The women also go nearly naked, for they wear little else than what may be termed a breech-cloth of buck-skin, which is black and filthy with dirt; and some have a part of a blanket. The children go entirely naked, the boys wearing nothing but a small string round their body. It is only necessary to say that some forty or fifty live in a temporary hut, twenty feet by twelve, constructed of poles, mats, and cedar bark, to give an idea of the degree of their civilisation.

"The men are engaged in fishing, and do nothing else. On the women falls all the work of skinning, cleaning, and drying the fish for their winter stores. As soon as the fish are caught, they are laid for a few hours on the rocks, in the hot sun, which permits the skins to be taken off with greater ease; the flesh is then stripped

off the bones, mashed and pounded as fine as possible; it is then spread out on mats, and placed upon frames to dry in the sun and wind, which effectually cures it; indeed, it is said, that meat of any kind dried in this climate never becomes putrid. Three or four days are sufficient to dry a large matful, four inches deep. The cured fish is then pounded into a long basket which will contain about eighty pounds; put up in this way, if kept dry, it will keep for three years.

During the fishing season the Indians live entirely on the heads, hearts, and offal of the salmon, which they string on sticks, and roast over a small fire.

The fishing is conducted very much in the same manner as at Willamette falls, except that there is no necessity for planks to stand on, as there are great conveniences at the Dalles for pursuing this fishery. They use hooks and spears attached to long poles: both the hook and the spear are made to unship readily, and are attached to the pole by a line four feet below its upper end. If the hook were made permanently fast to the end of the pole, it would be liable to break, and the large fish would be much more difficult to take. The Indians are seen standing along the walls of the canals in great numbers, fishing, and it is not uncommon for them to take from twenty to twenty-five salmon in an hour. When the river is at its greatest height, the water is about three feet below the top of the bank.

The Dalles is one of the most remarkable places upon the Columbia. The river is here compressed into a narrow channel, 300 feet wide, and half a mile long; the walls are perpendicular, flat on the top, and composed of basalt; the river forms an elbow, being situated in an amphitheatre, extending several miles to the north-west, and closed in by a high basaltic wall. From appearances, one is led to conclude, that in former times the river made a straight course over the whole; but having the channel deeper, is now confined within the present limits. Mr. Drayton, on inquiry of an old Indian, through Mr. Ogden, learned that he believed, that in the time of his forefathers they went up straight in their canoes.

Besides the main channel, there are four or five other small canals, through which the water passes when the river is high: these are but a few feet across. The river falls about fifty feet in the distance of two miles, and the greatest rise between high and low water mark is sixty feet. This great rise is caused by the accumulation of water in the river above, which is dammed by this narrow pass, and is constantly increasing until it backs the waters, and overflows many low grounds and islands above. A tremendous roar is constantly heard, caused by the violence of the river and its whirlpools and eddies.

The officers of the company have but little time allowed them to attend to their comforts; so completely are they under the control of accident, that they are liable to be called upon at any moment. Their rights, however, are looked to as much as possible, and the great principle adopted as the incentive to action, is the advancement they may obtain by their own merit, through which

alone they can get forward. In consequence of adhering to this principle, the Hudson's Bay Company are always well served. The discipline that is preserved is the very best, and sits lightly upon all. Those who do not meet with advancement, have some great fault in a trader's eye. The enterprise and energy required to serve this company well, is of no ordinary kind, and few men exhibit more of both these qualities than those I met with in its employ.

On the morning of the 4th of July, they began to pass the portage, which is a mile in length. It is very rugged, and the weather being exceedingly warm, many of the Indians were employed to transport articles on their horses, of which they had a large number. It required seventy men to transport the boats, which were carried over, bottom upwards, the gunwale resting on the men's shoulders. By night all was safely transported, the boats newly gummed, and the encampment formed on a sandy beach. The sand, in consequence of the high wind, was blown about in great quantities, and every body and every thing was literally covered with it.

From the high hills on the southern bank of the river, there is an extensive view of the country to the south. The distant features of this prospect was presented round barren and arid hills. These hills, as well as the country nearer at hand, were covered with natural hay, or bunch grass, which affords very nutritious food for cattle.

The number of Indians within the Dalles mission is reckoned at about 2000; in but few of these, however, has any symptom of reform shown itself. They frequent the three great salmon fisheries of the Columbia; the Dalles, Cascades, and Chutes, and a few were found at a salmon fishery about twenty-five miles up the Chutes river.

The season for fishing for salmon, which is the chief article of food in this country, lasts during five months, from May to September. The country also furnishes quantities of berries, nuts, roots, and game, chiefly of bears, elk, and deer; but owing to the improvidence of the native inhabitants, they are, notwithstanding this ample source of food, often on the verge of starvation.

After the fishing and trading season is over, they retire to their villages, and pass the rest of the year in inactivity, consuming the food supplied by the labours of the preceding summer; and as the season for fishing comes round, they again resort to the fisheries.

The country about the Dalles is broken, and the missionaries report that this is the case for some miles around. There are, however, some plains and table lands, which are considered as very fertile, being well watered with springs and small streams; affording abundant grazing, and well supplied with timber—oak and pine. The soil varies in quality, and portions of it are very rich. Garden vegetables succeed, but require irrigation. Potatoes also must be watered, by which mode of culture they succeed well. Corn and peas can be raised

in sufficient quantities. The produce of wheat is about twenty-five bushels to the acre: this is not, however, on the best land. They sow in October and March, and harvest begins towards the end of June. The climate is considered healthy; the atmosphere is dry, and there are no dews. From May till November but little rain falls, but in winter they have much rain and snow. The cold is seldom great, although during the winter preceding our arrival, the thermometer fell to 18 deg. Fahrenheit. The greatest heat experienced in the summer was 100 deg. in the shade; but even after the hottest days, the nights are cool and pleasant.

At daylight on the 3rd of July, the goods were all embarked. When the party reached the Chutes: a portage over which they carried their goods for a quarter of a mile, and in an hour and a half they were again on their way above these rapids.

During very high water, the fall, whence the place takes its name, is not visible, but when it is low, there is a fall of ten feet perpendicular, that occupies nearly the whole breadth of the river. It is impossible to pass this fall at low water; but when the river is swollen, boats shoot it with ease and safety. The Columbia, from the Chutes as far as John Day's River, is filled with rocks, which occasion dangerous rapids. The boats were, in consequence, tracked for the whole distance.

After passing the Dalles, an entirely new description of country is entered. The line of wood extends no further. The last tree stands on the south side of the river, about six miles above the Dalles. The woods terminate at about the same distance from the coast in all parts of this region south of the parallel of 48 deg. north.

The country between these places is decidedly volcanic, and the banks on either side of the river are rocky and high. In this part of the country it is very hot when there is no wind.

Mr. Drayton had no thermometer, and therefore was unable to ascertain the exact degree of heat—but any metallic substance exposed to the sun for a short time, became so hot, as not to be held in the hand without suffering, and the men were nearly exhausted with the oppressive heat.

John Day's River falls into the Columbia from the south. It abounds with salmon, and, to catch which, the Indians resort to it, and erect temporary lodges during the salmon season. This part of Oregon is described as a rocky region, with vast quantities of fine sand, brought down the freshets of the river, and deposited, where the Indian or trading encampments are made. When proceeding up and down the Columbia, these sand-banks become in summer exceedingly dry and hot. Few places can be more uncomfortable to encamp upon.

A basaltic wall rises 900 or 1000 feet within 200 yards of the encampment, and reflects the sun's rays down upon the white sand-beach, the heated atmosphere becomes, in consequence, almost insupportable; the rocks, an hour after

the sun had set, were found too hot to sit upon. At the time of encamping they had a *rattle-snake hunt*, and several large ones were killed.

The party proceeded upwards the next morning with the rising sun, a breeze carried them onwards, and about eight miles above their encampment, they came to the *Hieroglyphic Rocks*, upon which are supposed to be recorded the deeds of some former tribe.

Above John Day's River, the country becomes much lower, more arid, and the stream of the Columbia less rapid. The weather continued exceedingly hot, and islands, or dry banks in the river, were passed, composed entirely of drifted sand. At the long reach, below Grand Island, the country is sandy and flat up to the Grand Rapid Hills.

Proceeding up the long reach, the voyageurs exchanged the pole for the tow-line and oar, and the Indians being no longer wanted, were discharged.

The distance ascended this day, aided by the breeze, was fifty-seven miles; the previous day the progress was only sixteen miles. While passing close along the banks, numerous *pintailed* grouse were so tame as to allow the boats to approach within a few yards.

All along the Columbia, from the Dalles upwards, there was only one tree seen growing, and, except a log or trunk drifting down occasionally, nothing larger than a splinter of wood was seen. The wood used for cooking was brought there by the Indians, who would follow the party for miles with a long pole, or a billet of wood, which they exchanged for a small piece of tobacco. The Indians also sold the party several large hares of extremely fine flavour.

The country upwards continued to be, as far as could be seen, on both sides of the Columbia, a barren and sterile waste, covered with white sand, mixed with pebbles, producing nothing but a little grass, some hard wood, and a species of small cactus, filled with long, white, hard, and sharp spines.

On the 6th of July, the party reached the foot of the Grand Rapids, up which the boats were tracked. They afterwards passed along the foot of Grand Rapid Hills, which consist of basalt, lava, and scoriæ. These hills rise abruptly near the river, and are fast crumbling and falling into the stream.

Eighteen miles below Walla-walla, they passed the Windmill Rock, near which arise a number of basaltic peaks. On approaching Walla-walla, the scenery changes into bold grandeur. Fantastic volcanic peaks arise, either isolated or in groups. Through a pass in the river which flows rapidly through volcanic rocks, the wind rushes with great violence in summer, to restore the equilibrium in the rarified atmosphere above.

About a mile and a half below the Hudson Bay Company's fort, Nez Percé, at the junction of the Willamette, the banks of the river become flat, and during floods scarcely rise above the stream. This low ground is composed of pebbles and drifting sand for several miles to the east and to the north, with little

or no soil for arable purposes. It produces nothing but scattered tufts of bunch grass and wormwood.

NEZ PERCÉ; or, Fort Walla-walla is about 200 feet square, and fenced in with *pickets*: having a gallery erected within; along the walls, so high as to enable those inside to overlook the pickets, and observe the surrounding country. It has two bastions, one on the south-west, and the other on the north-east. On the inside are several buildings, constructed of logs and mud; one of which is the Indian store; the whole is covered with sand and dust, which is blown about in vast quantities. The climate in summer is very hot, and every thing about the fort seemed so dry, that it appeared that a single spark would ignite the whole, and reduce it to ashes.

Mr. Ogden informed the party, that the most experienced voyageur is taken by him for the brigade as pilot, or bowman of the leading boat. This post is considered one of great trust and honour. Each other boat has also its bowman, who is considered the first officer and responsible man; the safety of the boat in descending rapids, particularly, depends upon the bowman, and the *padroon* who steers the boat. They both use long and *broad blade* paddles; and it is surprising how much power both possess over the direction of the boat. These men, from long training, become very expert, and acquire extraordinary self-possession, courage, and dexterity amidst the most frightful dangers. Their laborious fidelity and endurance are remarkable; for a remuneration of no more than 17*l.* sterling a year, pay, and the coarse fare they receive. Their food consists of coarse bread, made of unsifted flour or meal, dried salmon, fat (tallow), and dried peas.

Captain Wilkes "is satisfied, that no American would submit to such food; the Canadian and Iroquois Indians use it without murmuring, except to strangers, to whom they complain much of their scanty pay and food. The discipline is strict, and of an arbitrary kind; yet they do not find fault with it."

Very few of those who embark or join the company's service, ever leave the part of the country they have been employed in; for after the expiration of the first five years, they usually enlist for five more. This service of eight years, in a life of so much adventure and hazard, attaches them to it, and they generally continue till they are old men; when, being married, and having children by Indian women, they retire under the auspices of the company, to small farms, either on the Red or Columbia rivers. There is no allowance stipulated for their wives or children; but *one* is usually made, if they have been useful. If a man dies, leaving a family, although the company is not under any obligation to provide for them, they are generally taken care of. "The officers of the company are particularly strict in preventing its servants from deserting their wives; and none can abandon them without much secrecy and cunning. In cases of this sort, the individual is arrested, and kept under restraint, until he binds himself with se-

curity, not to desert his family. The chief officers of the company hold the power of magistrates over their own people, and are bound to send fugitives or criminals back to Canada for trial, where the courts take cognizance of the offences.

"The community of old voyageurs settled in Oregon, are thus constrained to keep a strict watch upon their behaviour; and although perhaps against their inclinations, are obliged to conform to the wishes of those whose employ they have left."

The brigade of voyageurs and traders under Mr. Ogden, proceeded up the Columbia to Okonagon, and the American party rode upwards of twenty miles before dark, passing over the pasture grounds of the horses belonging to the company. Some months before several horses were driven by the wolves over an alluvial bank, about 100 feet in height, and killed and eaten by those voracious beasts, which are very numerous in this territory.

They passed over borders of the Walla-walla, for about half a mile from its banks. As far as seen by the party, the country was green and fertile.

The banks of the small tributaries falling into the Walla-walla were of a similar character. To the north and south are extensive prairies, covered with the natural hay of the country, on which the cattle feed. This natural grass grows up spontaneously and luxuriantly with the early spring rains.

It is afterwards, on the ground, without cutting, actually transformed into hay by the great heat and drought of the month of July.

It is not withered, but suddenly dried with its nutritious qualities retained. In this state cattle prefer it even to the young green grass of the meadows bordering the streams.

The party visited the American mission Wailaptu, established in 1837. There is a second missionary station, Lapwai (clear water), at the mouth of the Kooskooskee. There was a third, Kamia, instituted about sixty miles up that river. It was abandoned in two years as useless.

The mission at Chimikaine, is about sixty miles south-east of Fort Colville, and near the river Spokane, a stream falling into the Columbia.

At the first mission, Wailaptu, the party found two houses, each of one story, built of adobes, with mud roofs, to insure a cooler habitation in summer. Also a small saw-mill and some grist-mills, all moved by water; a kitchen-garden in which grows all the ordinary kinds of vegetables raised in the United States, and several kinds of fine melons. The wheat, some of which stood seven feet high, was nearly ripe. Indian corn grew as high as nine feet in flower. The soil in the vicinity of the small streams near the mission, was found to be a rich black loam, and very deep; but the whole area fit for cultivation along these streams did not amount to more than 10,000 acres. Parts are annually overflowed by the rivers; and the whole might, if necessary, be easily irrigated.

These streams take their rise in the Blue Mountains, about forty miles east of Walla-walla, and are never known to fail.

"The climate of this district," says Captain Wilkes, "is very dry, as it seldom rains for seven or eight months in the year. During the greater part of this time, the country, forty miles north and south of this strip, has an arid appearance. There are large herds of horses owned by the Indians, that find excellent pasturage in the natural hay on its surface. There is a vast quantity and profusion of edible berries on the banks of the stream above spoken of, consisting of the service berry, two kinds of currants, whortleberry, and wild gooseberries; these the Indians gather in large quantities for their winter supplies.

"The *Grande Ronde* is a plain or mountain prairie, surrounded by high basaltic walls. This is called by the Indians 'Karkarp,' which is translated into Balm of Gilead. Its direction from Walla-walla is east-south-east, and the road to the United States passes through it. It is fifteen miles long by twelve wide, and is the place where the Cayuse, Nez Percé, and Walla-walla Indians meet to trade with the Snakes or Shoshones, for roots, skin-lodges, elk, and buffalo meat, in exchange for salmon and horses.

"The *Grande Ronde* is likewise resorted to for the large quantities of *cam-mass-root* that grows there, which constitutes a favourite food with all the Indians. The missionaries have quite a number of cattle and horses, which require little or no attention, there being an abundance of hay and grass. The price of a good horse is twenty dollars. This district is capable of supporting a vast number of cattle. One *Cayuse* chief has more than 1000 horses on these feeding grounds."

The winters are described of about three months' duration, and snow remains on the ground for only a short time. Grass grows all winter. Mr. Kinley, of the Hudson Bay Company passed from the north-west or Snake Indian country across the Blue Mountains in January, 1841. He found the snow on the mountains five to six feet deep and the weather intensely cold. On descending to the plains and the *Grande Ronde*, the following day the temperature was agreeably warm; the grass was green, and the flowers in bloom. Trees re-appear on the banks of the Walla-walla, chiefly poplar, willow, birch, and alder. The poplar grows to the thickness of about two and a half feet, and to the height of about 100 feet.

Captain Wilkes says little that is satisfactory of the success of the labours of the missionaries. "The Indians wander away, and seldom continue more than three or four months in the same place. After they return from the *Grande Ronde*, which is in July, they remain for three or four months and then move off to the north and east to hunt buffalo. After their return from the Buffalo hunt they are again stationary for a short time." The Indians have begun irrigating their arable lands, in imitation of the missionaries. There are

grouse, curlew, and two kinds of hare, and some other sorts of game abound in this district.

In company with Mr. Gray the party proceeded from the Mission to the Blue Mountains. On their way they passed through large herds of horses belonging to the Cayuse Indians: the soil improved. It consisted chiefly of decomposed scoria of a reddish colour, finding luxuriant grass here in every direction; and the grass in such places, from receiving more moisture, is more luxuriant. They ascended from the prairie up the mountain to "the snowline," about 5600 feet. The pine-forest extend up to this height, and the Walla-walla, with its numerous branches, could be seen wending through the plains beneath until it flowed into the Columbia River.

Captain Wilkes observes, "There seems to be a peculiarity about the climate at Walla-walla not readily to be accounted for. It has been stated above that little winter weather is experienced here, and that this mildness is owing to the hot winds of the south, which sweep along from the extensive sandy deserts existing in Upper California. This wind or simoon during the summer is held in great dread in this part of the country, for it is of a burning character that is quite overpowering. It generally comes from the south-west. In consequence of this feature of the climate there is very little vegetation near the fort, not only on account of the heat and dryness, but owing to the vast clouds of drifting sand which are frequently so great as to darken the sky. In summer it blows here constantly, and at night the winds generally amount to a gale." A phenomenon is observed at the junction of the *Columbia* and *Snake Rivers*. The current of the *Columbia*, flowing from the north, is remarkably cold; the *Snake River*, flowing from the south, is warm. "This difference is perceived even at Walla-walla, for the water passing along the east shore near the fort is too warm to drink, and when they desire to have cooler water for drinking it is brought from the middle of the river by a canoe."

The party on descending from Walla-walla chose the left or south bank of the *Columbia*. The route on the north side is shortest, but not so easily travelled over as on the south. In passing along Indian *trails* are seen, many sometimes converging into one, or diverging from one into several tracks, mark the routes of the Indians in their journeys over the country. When they reached the Dalles, the aspect of this part of the *Columbia* was greatly changed. The waters had fallen during the previous twenty days thirty feet. The river had not even then fallen to its lowest depression, but was confined within high perpendicular rocks, and the beach where the party three weeks before had stood, and from which they were able to touch the flood as it passed, was now far above it, and the river, instead of rushing through many channels, was now confined to a

single one. It still, however, rushed along with all the fury and violence of a mighty torrent, and had as yet as much as twenty-seven feet to fall to low water. "In this state of the river the company's boats frequently shoot or descend it, but this is at all times an exploit of great danger. Many fearful accidents have taken place with the most experienced boatmen, who with all their skill could not preserve themselves from being carried into the vortex, drawn under, and destroyed. "Such is the peculiar nature of the rush of water through the Dalles, that for some minutes the whole will appear quite smooth, gliding onwards as though there were no treachery within its flow, when suddenly the waters will begin to move in extended and slow whirls, gradually increasing in velocity until it narrows itself into almost a funnel shape, when having drawn towards it all within its reach, it suddenly ingulphs the whole, and again resumes its tranquil state."

During the expedition to Walla-walla, Mr. Drayton made the necessary observations for constructing a map of the Columbia above the Cascades as far as Walla-walla, which has been incorporated in Captain Wilkes's chart of Oregon* in the small atlas accompanying the narrative of the exploring expedition.

CLIMATE.—The state of the weather during the period of one hundred and six days, was as follows: Fair, seventy-six days; cloudy, nineteen days; rain, eleven days.

The crops of all descriptions of grain were good, which Captain Wilkes supposed to be the best criterion of the climate. The temperature of the western section throughout the year, is mild; with little extreme heat in summer, or severe cold in winter. He considered this to be owing to the constant prevalence of the south-westerly or ocean winds. "It certainly is not owing to the influence of any warm stream setting along its shores. The current near the coast sets to the south east, and is of a cold temperature: it would rather tend to lessen the heats in summer than the cold in winter. There have been no observations kept by the missionaries in this lower section of the country. It is liable, from the experience of our parties, to early frosts, owing to the proximity of the snowy mountains. Frosts sometimes occur in the latter part of August, which check all vegetation at that early season."

"The south-west winds are caused by the vast extent of the sandy and arid country lying east of the Cascade and Californian range of mountain, which, becoming heated, rarefies the air, and causes an indraught from the west. The current is found to increase in violence as the rarefied region is approached; and so constant is this draught, that we experienced only three days of easterly winds during our stay, and these were very moderate in force. Immediately on the

* This map embraced the whole of the territory of Oregon between the parallels of 42° and 54° N. The southern pass (called Fremont's Pass) of the Rocky Mountains is also included, which was taken from the surveys of Lieutenant Fremont, of the United States Engineer Corps.

coast the winds are from the west-south-west to west-north-west: these maintain their direction until they reach the interior, and blow with great violence.

"The winters are invariably what would be termed open ones with us. Snow seldom falls, and when it does, it rarely lasts more than two or three days. The rains during this season are frequent, though not violent. The climate in the western section, from all accounts, is not unlike that of England, and would be termed a wet one. The winter of 1840 was the severest they had yet experienced.

"The middle section is, on the contrary, exceedingly dry, and the temperature more changeable, the variations being great and sudden; the mercury has been known to fall as low as 18 degrees in the winter, and to rise as high as 108 degrees in the shade in summer. In Appendix xiii., vol. iv., will be found a register of the temperature kept at one of the missionary stations, Lapwai, on the Kooskooskee. It may be said to be on the eastern border of the middle section.

"The eastern section has an exceedingly variable climate: it fluctuates from cold to hot in a few hours, ranging through fifty or sixty degrees of temperature; yet from the accounts I have from very respectable authority, the cold is by no means severe for any length of time. The Rev. Mr. Smith, who was two years there, assured me that the cattle and horses required no other food than what they could pick up, the natural hay before spoken of being sufficient for their support.

"The climate throughout Oregon is thought to be salubrious for the white race; and was considered so by the Indians, prior to the year 1830, when the ague and fever, or any disease resembling it, was not known to exist. The Indians fully believe to this day that Captain Dominis introduced the disease in 1830. Since that time it has committed frightful ravages among them, not so much, perhaps, from the violence of the disease itself, as the manner in which they treat it. It was not until quite lately that they were willing to be treated after our mode, and they still in many cases prefer the incantations and practices of the medicine-man."

CHAPTER XXIII.

EXPEDITION TO OKONAGAN IN 1841.

On the 20th of May, Lieutenant Johnson was despatched in command of an expedition to explore the country below Nisqually over the Cascade range of mountains to Okonagan, on the Columbia. He was accompanied by guides and an interpreter, who understood the dialects of each tribe: the party were mounted on horses, and well equipped. The practicability of crossing the mountains was at first doubted, but accomplished by the perseverance and prudence of Lieutenant Johnson. After leaving the prairie they ascended by a path nearly overgrown with hazel, gualtheria, cornus, spiræa, vacunum, &c. The streams they met were crossed with difficulty, being swollen by the melting of snows in the mountains. They had frequently to cut their way through thickets and fallen timber: steep precipices were ascended, their horses often stuck fast in miry holes among the roots of trees. Along the banks of Uptascap they saw arbor vitæ trees thirty feet in circumference four feet from the ground, and above 100 feet high. They saw little game—and killed but one deer. They then passed over valleys and hills, and forests of spruce. Some of the fallen trees measured 265 feet in length. One which had been broken off, was supposed to measure little less than 300 feet, and was about thirty-five feet in circumference.

Some of the fallen spruce trees were so thick that it was impossible to see over them on horseback. On their trunks seedlings were frequently seen growing forcing their roots through the old bark and round the trunk until sustenance was found in the earth. To add to the difficulties the horses frequently strayed away during the night. Along the Smalocho the road lay near conical hills, the sides clad with gigantic pines. Cotton wood, maple, spruce, pine, elder, and an undergrowth of raspberry bushes were also passed. Lieutenant Johnson ascended *La Tête*, a bare mountain (2790 feet high), to make observations—latitude 47 deg. 8 min. 54 sec. north. The mountain and country near it had been overrun by fire.

The horses and Indians soon after became exhausted, and food scarce, which delayed them at the Little Prairie (47 deg. 5 min. 54 sec. north, longitude, 120 deg. 13 min. west, magnetic variation 19 deg. 39 sec. east). On the Cascade summit the snow was found ten feet deep by Mr. Waldron, who was sent on, before attempting the ascent with the horses and baggage. The snow began to melt rapidly. After enduring great fatigue the summit was passed by the cavalcade, and the descent accomplished. The breadth of snow passed over was about eight miles. The banks of the small streams on the eastern side of the range, were clothed with a

great variety of trees and shrubs. They proceeded down along the banks of the Spiper, a branch of the Columbia. Its banks were rugged, and they continued their journey over a very rough country, and afterwards over a high ridge covered with a scanty growth of pines, until they reached the Yakima, which being too deep to ford, was crossed in the India-rubber *Balsas*. Here they succeeded in purchasing moose and salmon from the Indians, and then continued their route to the northward, until they encamped on a plateau 5203 feet high.

They continued their route up the mountain, but the barometrical experiments were intercepted by the accidental breaking of the instrument, and they afterwards descended to the Columbia, near the stream called Pischous' River. Here the Columbia was rapid, its banks rugged, sterile, and destitute even of scattered trees. It flows through a narrow ravine from 1000 to 1500 feet deep. They then ascended and encamped on the south-west side on a patch of meadow land, where the Indians cultivate some potatoes. Many grouse and curlews were killed. They crossed, men and horses, the Pischous, with the aid of the Indians, and proceeded upwards towards Okonagan, over a rugged country—grouse prevailed. Some white marble was also seen. They afterwards crossed the Columbia by means of the India-rubber *Balsas* and a raft. They then ascended about 2000 feet to a plateau without wood and covered with long grass, and, after much fatigue, they reached on the 8th of June banks of the Columbia, opposite to Okonagan, to which they crossed. This as a trading post is described as falling into decay, and only kept up as a depôt for supplies in connexion with the northern parts of New Caledonia. Few furs are found in this neighbourhood, and the extreme scarcity of game and fur animals is remarkable in this part of middle Oregon. This post and Spokane were the first established by the American Fur Company (in 1812). It afterwards fell to the North-west, and then to the Hudson Bay Company.

It has, as usual at the posts, an Indian encampment on the outside, but there is no Indian settlement nearer than eight miles, where there is a salmon fishery. It is somewhat difficult to account for the scarcity of game, as the exploring party was "well satisfied that there is an abundance of food, and that all kinds of cattle would thrive exceedingly in this section, where grass is so abundant."

Okonagan is situated on a poor, flat, sandy neck, about two miles above the junction of the river of that name with the Columbia. It is a square, picketed in the same manner as those already described, but destitute of bastions, and removed sixty yards from the Columbia. French is the language spoken here, as it is at all the other posts of the company.

Half a mile above the mouth of the Okonagan it was found to be 300 feet wide: it is a dull, turbid stream. The Columbia at this place was found to be 1900 feet wide. Besides the care of barges for navigating the river, and the

horses for the land journey to the northern ports, the *employés* at this post collect what skins they can: about eighty beaver skins during the year, the price of each of which is usually about twenty charges of powder and ball. Some bear, marten, and other skins are also obtained, for which the prices vary.

At this point the company had some goats, and thirty-five head of very fine cattle, which produce abundance of milk and butter. Neither of them were then permitted to be slaughtered, and the only animal food used is a species of rat, caught by the Indians, called "siffleurs" which burrow among the stones on the hill sides in great numbers. They are very fat, and considered good food. The soil is too poor for farming operations, and only a few potatoes are grown.

There is, much further north, Fort Thompson, near the *Kamloops* Lake, from which a stream falls into Fraser's River, which is in charge of an *Indian*, and is of less importance than Okonagan.

The company's servants at this northern post live mostly on salmon. The difficulty of getting provisions to the posts in the interior is very great; all that is consumed at the north is carried twenty-four days' journey on pack-horses, and eighteen in barges, before it arrives at its destination; and the amount transported is not more than enough to supply the officers whose allowance is very limited. The servants of the company at these places receive an increase of pay as some recompense for their privations. In the vicinity of Fort Okonagan, are found gooseberries, June berries, and currants, which ripen in June.

The Columbia, in the neighbourhood of Okonagan is very winding in its course, and is interrupted by *dalles*, about five miles above.

The expedition ascended the Okonagan to the country above Grande Coulée, supposed previously to have once been the bed of the Columbia; but, on examination, it was considered as "much too wide, and that its entrance was nearly choked up by granite hills, that do not leave sufficient space for the river to have flowed through. The walls of the Coulée consist of basaltic cliffs similar to those of the *Palisades* of the Hudson, 790 feet high; and where it was crossed by the party, it was three miles wide; but a few miles further to the south, it narrowed to two miles. Its direction is nearly north and south, fifteen miles."

In the level parts of the Coulée, the earth was much cracked; saline incrustations were abundant, which, sparkling brilliantly in the sun, gave the plain somewhat the appearance of being covered with water.

The Coulée, which was probably at a former period a lake, is impregnated with saline matter, and considered unfit for grain crops, but as "admirably adapted for the raising of cattle and sheep, there being abundance of water, and plenty of good grass here, and for twenty miles on each side of it."

After leaving the Coulée, they travelled over a gently-rolling prairie country, affording excellent sheep-pasture, but entirely destitute of trees. After travelling fourteen miles, they reached the "Coulee des Pierres," where the prairie termi-

nated. This has features somewhat similar to those of the Grande Coulee for two miles, when, turning to the right, and two miles further, brought them to the Columbia, whose banks were here thickly wooded.*

Following the course of the river for four miles, over spurs of hills, they reached the confluence of the Spokane, which was 300 feet broad at its mouth; but which, like the Columbia, was at this time much swollen opposite to the mouth of the Spokane; there are rocks in the Columbia beneath the surface of the water, which cause rapids; but there is no perceptible fall, and the barges shoot over them without much danger. By the assistance of some Indians, with two canoes they crossed the river, and breakfasted on the opposite side that day.

On arriving at Fort Colville, after having experienced some difficulty in riding their Indian horses up to the gate; for the waggons, poultry, pigs, cabins, and other objects of civilisation, excited no little alarm to their animals. Lieutenant Johnson proceeded up the Spokane, "which, for the first ten miles, has a course of east-south-east. The route passes through much fine scenery, and on the southern side of the river, the hills form terraces, clothed with grass, and having a few pines growing on them. The pines yield an agreeable shade, and the banks offer numerous beautiful sites for dwellings. The river itself is pretty: its waters are transparent, and it is joined in its course by many bubbling brooks. To judge from the number of sheds for drying salmon, it must abound with fish. The average width of the stream was about 200 feet."

After leaving the Spokane, they rode in a north-east direction, over hills covered with pines, and through valleys rich with fine meadows; and after a ride of thirty-five miles from the mouth of the Spokane, reached the missionary station of *Chimikaine*.

On returning from this mission to Colville, they travelled through an extensive valley to the north, with hills on either side of from 600 to 1000 feet in height. This valley is crossed by numerous streamlets and brooks, and appears to have an extremely fertile soil. The largest stream passed was one near Colville, on which the Hudson Bay Company have their grist-mills; this is about fifty feet wide. Within ten miles of the fort, the house of the company's storekeeper was passed, and near it is found a species of white chalk, or pigment, which is much used at the fort, instead of the common lime whitewash, from which it is scarcely distinguishable. On reaching the fort, the hospitality of the Hudson Bay Company's superintendents soon made the party forget the fatigues of their journey up the Spokane.

Fort Colville is situated on the east bank of the Columbia, just above the Kettle Falls, where the river is pent up between rocks, and runs or rushes in a lateral channel, which nearly encircles a level tract of land, containing about 200 acres of rich soil. Of this peninsula, about 130 acres are under cultivation, and produce crops

* On the banks were found a singular species of *Trillium*, almost stemless.

of wheat, barley, and potatoes; small quantities of oats, Indian corn, and peas, are also raised, but garden vegetables have never succeeded well. The failure, however, is to be attributed either to bad seeds, or unskilful management; for the soil, which is a rich black loam, mixed with a portion of gravel, seems capable of producing any thing. The whole peninsula has the appearance of having been deposited by the river, and is believed to be the only spot of that character formed in its whole course.

There are two entrances to the fort, from one of which a road leads to the grist-mill; from the other a path leads along the bank of the river.

Fort Colville, like the other posts of the Hudson Bay Company, contains the dwellings and warehouses, and is surrounded with high pickets and bastions, forming a strong defensive work against the Indians.

Being surrounded by good soil, it is superior for the purposes of cultivation, to any other post on the upper waters of the Columbia.

The Kettle Falls are formed by a ledge or stratum of quartz which crosses the river, and from being harder than the rocks either above or below, has suffered less by *abrasion*, and thus forming a *basin*, which, from its fame, is called the Kettle or Churdur. The total descent of the water is about fifty feet, which prevents the passage of boats. At the foot of the falls, the breadth of the river is 2330 feet, and the average of the current is four miles an hour.

There is an Indian village on the banks of the great falls, inhabited by a few families, who are called "Quiaripi" (Basket People), from the circumstance of their using baskets to catch their fish (salmon).*

At the lower end of the falls are large masses of quartz rock, on which the Indians dry their fish. Few of the salmon, even if able to pass the lower falls, ever get by the upper one, being generally caught between the two falls; consequently, above this place no salmon are taken. A short distance below the Kettle Falls, are the Thompson Rapids, which begin at the mouth of Mill River, and extend for some distance below that point.

Fort Colville is stated, by the officers of the Hudson Bay Company, to be 2200 feet above the sea. "This great rise takes place within the space of 500 miles, and is unequalled in any other river of so great a size. The cultivation of crops is here the principle object of attention; for the whole of the northern posts depend upon Fort Colville for supplies of provisions.

"As to climate, this region has the reputation of being more rainy than the country below, but seasons occur when no rain falls. In the summer the temperature varies very considerably in the course of twenty-four hours. The temperature in summer (July) rises to 100 deg, and falls to 12 deg. in January and February. The winter commences in November, and ends in March. They fre-

* These are great basket-work cribs, in which, Captain Wilkes says, that sometimes 300 fish are caught at one haul.

quently have flowers blooming in February. The time of planting the spring-wheat is in April; the winter grain is sown in October, and succeeds best particularly if the autumn should be a wet one. The crops of wheat are reaped in August. Indian corn is not a sure or prolific crop: it is planted in May, and gathered in September. Potatoes, beans, and some oats, with 2000 bushels of wheat, are raised annually at this place.

“Of fruits they have those of the country, such as the service-berry, strawberry, wild-cherry, and the hawthorn-berry. These ripen from June to September. *Imported fruit-trees* have not as yet succeeded; it is said the spring frosts are too frequent and too severe.”

This post was established in 1825, at which time a bull and two cows were introduced from Vancouver, and (down to 1841), from these have sprung 196 head of fine cattle. They have likewise thirty mares with foal, and sixty grown horses. The horses are little used during the winter, and are usually turned out to shift for themselves. Care is, however, taken to keep them in places which are much exposed to the sun, and in consequence least covered with snow.

The operations of the Hudson's Bay Company over the northern portion of Oregon, which is included in their maps, under the name of New Caledonia, are very extensive, and in this section they have several posts.*

* Sir Alexander Mackenzie, in his voyage of discovery across the continent in 1793, came to the spot on which Fort Alexandria is built, and was dissuaded by the Indians from following the course of the river to its mouth. On quitting this place he proceeded to the West Road River, from whence, by an overland journey, he succeeded in reaching the shores of the Pacific Ocean. This country is full of small lakes, rivers, and marshes. It extends about ten days' march in a north and north-east direction. To the south and south-east the Atnah, or Chin Indian country, extends about one hundred miles; on the east there is a chain of lakes, and the mountains bordering Thompson's River, while to the westward and north-west lie the lands of the Naskotins and Clinches. The principal rivers are Fraser's, Quesnel's, Rough Poplar, Chilcotin, and West Road. Of these Fraser's River only is navigable. It receives the waters of Quesnel and West Poplar rivers, which issue from small lakes to the eastward. The lakes are numerous, and some of them tolerably large; one, two, and even three days, are at times required to cross some of them. They abound in a plentiful variety of fish, such as trout, sucker, &c.; and the natives assert that white fish is sometimes taken. These lakes are generally fed by mountain streams, and many of them spread out, and are lost in the surrounding marshes. In visiting the Naskotin and Chin Indians, our conveyance is by canoes on Fraser's River; but our journeys to Bear Lake, Kloukins, and Chilcotins, must be performed on foot. The trading goods are now obtained from the Columbia department, to which the returns of furs are forwarded. Horses are used for conveying the goods, and the journey generally occupies six weeks. The roads are extremely bad, and in every direction we encounter numerous rivulets, small lakes, and marshes. The soil is poor: an indifferent mould, not exceeding eight inches in depth, covers a bed of gravel and sand. All the vegetables we planted, notwithstanding the utmost care and precaution, nearly failed; and the last crop of potatoes did not yield one-fourth of the seed planted. On the banks of the river, and in the interior, the trees consist of poplar, cypress, alder, cedar, birch, and different species of fir, spruce, and willow. There is not the same variety of wild fruit as on the Columbia. Service-berries, choke cherries, gooseberries, strawberries, and red whortleberries, are gathered; but among the Indians the service-berry is the great favourite. There are various kinds of roots, which the natives preserve and dry for periods of scarcity. There is only one kind which we can eat. It is called *tsa-chin*, has a bitter taste, but when eaten with salmon imparts an agreeable zest, and effectually destroys the disagreeable smell of that fish when smoke-dried. St. John's wort is very common, and has been successfully applied as a fomentation in topical inflammations. A kind of weed, which the natives convert into a species of flax, is in general demand. An evergreen similar to that found at the mouth of the Columbia, with small berries growing in clusters like grapes, also flourishes in this district. Sarsaparilla and bear-root

At Colville, the number of beaver-skins purchased is but small, and the packs which accrue annually from it and its two outposts, Koutaine and Flathead, with the purchases made by a person who travels through the Flathead country, amount only to forty, including the bear and wolf-skins. Musk-rats, martens, and foxes, are the kinds most numerous in this neighbourhood. The outposts above-mentioned are in charge of a Canadian trader, who receives his outfit from Colville.

Fort Chillcoaten is a clerk's station in latitude 52 deg. 10 min. north on the Chillcoaten branch of Frazer's River. The Chillcoatens are a small tribe num-

are found in abundance. A strong decoction of the two latter with the berries last mentioned has been repeatedly tried by our men in venereal cases, and has always proved successful. White earth abounds in the vicinity of the fort; and one description of it, mixed with oil and lime, might be converted into excellent soap. Coal in considerable quantities has been discovered, and in many places we observed a species of red earth, much resembling lava, and which appeared to be of volcanic origin. We also found in different parts of New Caledonia quartz, rock crystal, cobalt, talc, iron, marcasites of a gold colour, granite, fuller's earth, some beautiful specimens of black marble, and limestone in small quantities, which appeared to have been forced down the beds of the rivers from the mountains. The jumping-deer, or chevreuil, together with the rein and red-deer, frequent the vicinity of the mountains in considerable numbers, and in the summer season they oftentimes descend to the banks of the rivers and the adjacent flat country. The marmot and wood-rat also abound; the flesh of the former is exquisite, and capital robes are made out of its skin; but the latter is a very destructive animal. Their dogs are of diminutive size, and strongly resemble those of the Esquimaux, with the curled-up tail, small ears, and pointed nose. We purchased numbers of them for the kettle, their flesh constituting the chief article of food in our holiday feasts for Christmas and New Year. The fur-bearing animals consist of beavers; bears, black, brown, and grizzly; otters, fishers, lynxes, martens; foxes, red, cross, and silver; minks, musquash, wolverines, and ermines. Rabbits also are so numerous that the natives manage to subsist on them during the periods that salmon is scarce. Under the head of ornithology we have the bustard, or Canadian *outarde* (wild goose), swans, ducks of various descriptions, hawks, plovers, cranes, white-headed eagles, magpies, crows, vultures, wood-thrush, red-breasted thrush, or robin, woodpeckers, gulls, pelicans, hawks, partridges, pheasants, and snow-birds. The spring commences in April, when the wild flowers begin to bud, and from thence to the latter end of May the weather is delightful. In June it rains incessantly, with strong southerly and easterly winds. During the months of July and August the heat is intolerable; and in September the fogs are so dense that it is quite impossible to distinguish the opposite side of the river any morning before ten o'clock. Colds and rheumatisms are prevalent among the natives during this period: nor are our people exempt from them. In October the falling of the leaves and occasional frost announce the beginning of winter. The lakes and parts of the river are frozen in November. The snow seldom exceeds twenty-four inches in depth. The mercury in Fahrenheit's thermometer falls in January to 15 degrees below 0; but this does not continue many days. In general, I may say, the climate is neither unhealthy nor unpleasant; and if the natives used common prudence, they would undoubtedly live to an advanced age. The salmon fishery commences about the middle of July, and ceases in October. This is a busy period for the natives; for upon their industry in saving a sufficiency of salmon for the winter depends their chief support. Their method of catching the salmon is ingenious, and does not differ much from that practised by the upper natives of the Columbia. The Chilcotin River takes its rise in a lake of the same name: its course from Alexandria is S.S.E.; its length, including its meanderings, about one hundred and eighty miles; and its breadth varies from forty to sixty yards; it is quite shallow, and full of rapids. The lake is about half a mile in breadth, and sixty miles in length, and is surrounded by lofty mountains, from which a number of small rivulets descend. It contains abundance of sucker, trout, and white fish. Salmon, however, is the favourite fish; but as it does not regularly descend their river, they are often obliged to content themselves with the produce of the lake. They are poor hunters, otherwise they might chiefly subsist on animal food; for the rein-deer, with the red and moose deer, are found in great numbers in the mountains; and in the autumnal months the black-tail and jumping-deer are plentiful. According to their accounts, travellers may in six days, from the end of Chilcotin Lake, after crossing a range of mountains, reach a river in a southerly direction which discharges its waters into the ocean, at a place where the Indians carry on a traffic with Europeans.—*Cox's Columbia*.

bering about sixty families, and only four packs of peltries are contributed by them. A pack is equal to fifty-five beaver-skins of large size; a beaver-skin costs one foot and a half of tobacco (rolled kind), or six are bought for a blanket.

Fort Alexandria, called after the celebrated Sir Alexander Mackenzie, in latitude 52 deg. 30 min. north, is the point where the navigation of Frazer's River is begun by the northern brigade, on their way north a chief trader resides. Twenty or thirty packs are procured here, seven of which are beaver. A few cattle are kept at Alexandria, about which is the only small open space in the northern country that is cleared, the rest being covered with a dense fir-forest, consisting principally of different species of firs, with some birch willow, alder, poplar, and maple-trees.

Fort George is another station at the junction of Stuart's and Frazer's Rivers. It has a few cattle, and provides during the year a few packs. A clerk of the company is stationed here.

Fort Thompson, on the Kamloops River, lies in 50 deg. 38 min. north longitude, 120 deg. 7 min. 10 sec. west of Frazer's, Babine's, and McLeod's, on the lakes of the same names, together with that of Fort St. James on Stuart's Lake, are all places of trade, and yield a profitable return for the expenditure and labour employed in maintaining them. The company are now extending their posts to the northward, behind the Russian settlements, where an officer of the company has been exploring. During the summer, the travelling in this country is performed on horseback, or in canoes; but in winter, when the ground is covered to a great depth with snow, and the rivers frozen, the only mode of journeying is on snow-shoes, or in sledges drawn by dogs. These animals draw a weight of 200 pounds. The snow-shoes require to be six feet long and eighteen inches broad; and notwithstanding the incumbrance they might be supposed to cause, it is not uncommon for individuals in the company's service to travel on them for days together a distance of thirty-five miles a day.

Frazer's River takes its rise far north in this region, and flows through it. The country is also well watered by the numerous streams flowing from the mountains. The company's boats never navigate the Frazer's River below Fort Thompson. Sir George Simpson, who passed down in 1828, says, that he found the navigation so dangerous and difficult, that it was almost totally impracticable. If it had offered any facilities for navigation, the distance it would have saved in the transportation of goods for the northern posts, would have caused the adoption of the route. From Vancouver to Okonagan, is 300 miles by water, with four portages; and from Okonagan to Fort Thompson by land, 150 miles; thence to Fort Alexandria, 120 miles, and as much more to Fort St. James, 120 miles; total distance, 720 miles, requiring nearly sixty days in travelling, two-thirds of which time is employed in going from Fort Okonagan to Fort St. James. The distance, however, without loads, and with expedition, may be travelled in twenty days.

The climate of this northern section of country is unfavourable to agriculture, in consequence of its being situated between two ranges of mountains: the Rocky Mountains on the east, and the extension of the Cascade Range on the west. Both of these are constantly covered with snow, notwithstanding which, the climate is said not to be remarkably severe. Snow, however, lies on the ground from November till April or May, and is on an average six feet deep. From the end of May till the beginning of September, fires can be dispensed with, but not during the rest of the year.

There are many spots of fertile land along the rivers, but the early frosts are a great obstacle to agriculture. Potatoes, turnips, and some wheat and barley, are, however, raised at Fort Alexandria and Fort George; but at the more northern, as St. James, Babine, and Frazer's, only the two former vegetables can be cultivated. Cattle are now reared in considerable numbers at most of the posts.

The latitude of Fort Colville was ascertained by observations at the fort, to be 48 deg. 36 min. 16 sec. north, longitude 118 deg. 04 min. 00 sec. west.

The formation of the country, after leaving the Spokane, was lava or trap, of which rock the latitude of 48 deg. north, seems to be the limit, after which it gives place to granite. This was found to be the case, also, in the Straits of Fuca, where the same parallel is the dividing line of the two rocks; and as far as our opportunities and information went, there seemed to be but little doubt, that this line extends from the sea-coast to the Rocky Mountains. And Captain Wilkes considers, that the whole portion of the Oregon territory to the south of the Spokane is of igneous formation.

The party then travelled the next thirty miles in an east-north-easterly direction from the Spokane. The country they passed over was hilly, with lakes and open glades intervening; the soil was poor, sandy, and stony; a few scattered pines were seen on the hills, and around the lakes were cotton, wood, and willow bushes. They afterwards rode through a rich and fertile valley running in a south-west and north-east direction, in which the horses sank in clover up to their knees.

On the following day, they passed over, for thirty miles, a fine rolling prairie country, producing rich pasture, and being well watered though destitute of wood. The plants seen were convolvulus, fraseria, habenaria, calochortus, baptisia, and trifolium: the last is good food for cattle.

During the day they met a party of Indians travelling with abundance of spare horses; to one of which were slung their tent-poles, wood of the kind being scarce in this country.

On the 25th of June, the party reached the Kooskooskee, which was found 2000 feet below the plain they had been travelling on, and 800 feet wide. Lewis and Clarke reached this river about forty-five miles above this place.

On the Kooskooskee, Mr. Spalding, the missionary, had built himself a house

of two stories, with board-floors, as well as a grist and saw-mill. For these he procured the timber in the mountains, and rafted it down himself. He had twenty acres of fine wheat, and a large field, in which were potatoes, corn, melons, pumpkins, peas, beans, &c., the whole of which were in good order.

"This part of Oregon (the district of the Kooskooskee) is admirably adapted to the raising of sheep: *the ewes bear twice a year, and often produce twins?* One ewe was pointed out to our gentlemen that had seven lambs within 365 days. Horned cattle also thrive, but the stock is at present limited. The Indians have a strong desire to procure them. A party were persuaded to accompany a missionary, and take horses over to St. Louis (Missouri) to exchange for cattle. When they reached the Sioux country, the chiefs being absent, they were attacked, and all murdered, except the white man."

The missionary regards the Kookooskee climate as a rainy one, notwithstanding the appearance of aridity in the vegetation. There is no doubt of its being so in winter, and even during summer there is much wet. A good deal of rain had fallen the month before the visit of the exploring party. The nights were always cool. The temperature falls at times to a low point. On the 10th of December, 1836, it fell to 10 deg.; and subsequently was not so low till the 16th of January, 1841, when it fell to 26 deg.; and on the 10th of February, it was as low as 14 deg. Fahrenheit.

The greatest heat experienced during his residence, was in 1837; on the 23rd of July, in that year, the thermometer rose to 108 deg. in the shade. In 1840, it was 107 deg.; and in the sun it reached 144 deg. The extreme variations of the thermometer were more remarkable, the greatest monthly change being 72 deg.; while the greatest daily range was 58 deg. Since the missionary's residence, no two years have been alike. The grass remains green all the year round. For arable culture irrigation is necessary; wheat, Indian corn, vegetables, &c., succeed well.

The description which we have of the coast of Oregon as far as had been explored by the celebrated Vancouver, is remarkably in accordance with the account given by Captain Wilkes, and the accuracy of the sketches made by Sir Alexander Mackenzie, one of the most intrepid travellers who ever accomplished great and perilous undertakings, are still more remarkable in describing the more northerly sections which he traversed, and in his suppositions regarding the portions which he had not explored. Captain Cook's account of the Nootka Sound, and of the adjacent parts of Vancouver's Island, is considered remarkably correct, but the aborigines would appear to have greatly diminished in number since the period of his visit. At that time they were noted thieves, and perfidy seems to have ever since been characteristic of the natives of that place, and of all Vancouver's Island.

Of the parts of Northern Oregon over which Sir Alexander Mackenzie travelled, we have no recent description more correct than the sketches in his journal. Al-

though there are, no doubt, some parts of the regions north of the inlet where he fell in with the sea, capable of cultivation, and, although many tracts are covered with wood even north of Cook's Inlet, yet, except for fishing and for the wild animals, there would appear to be but little other value in the region possessed by Russia* north of 54 deg., or of that part of Oregon, west of the Rocky Mountains, and north of 49 deg. north latitude. All the glowing descriptions of Vancouver—all that is described fit for cultivation and settlement by Captain Wilkes apply to districts and places south of that parallel. All north of 49 deg. is described as dreary, rugged, and unfit for settlements, by Vancouver; and the parts of Oregon west of, and within Admiralty Inlet, and south of Vancouver's Islands are those of which he says, "To describe the beauties of this region will, on some future occasion, be a very grateful task to the pen of a skilful panegyrist. The serenity of the climate (he was here in May), the innumerable pleasing landscapes, and the abundant fertility that unassisted nature puts forth, require only to be enriched by the industry of man, with villages, mansions, cottages, and other buildings to render it the most lovely country that can be imagined; whilst the labour of the inhabitants would be amply rewarded in the beauties which nature seems ready to bestow on cultivation." Of the whole western shores of Oregon, north of 48 deg. 29 min., he gives the most cheerless, sterile, and uncultivable character. "This country" (extending north from 48 deg. 29 min.), he says, "presented a very different aspect from that which we had been accustomed to behold from the south. The shores now before us were composed of steep rugged rocks, whose surface varied exceedingly in respect to height, and exhibited little more than the barren rock, which in some places produced a little herbage of a dull colour, with a few dwarf trees." The whole east coast of Vancouver's Islands and the opposite shores are described as little better, and generally more forbidding.

Sir Alexander Mackenzie proceeded from Canada over the waters and wilderness of America to the height of land which separates the waters running into Hudson's Bay from those flowing into the Pacific. His perilous journey was one of the most arduous, perhaps, the most difficult ever performed by man. This is evident when we consider the unknown state of the wilderness and of the savage tribes.

On the 12th of June, 1793, he left a small lake, in latitude 54 deg. 24 min. north, longitude 121 deg. west,—considered by him the source of the Unjiga, or Peace River, which falls into the Slave Lake, and after flowing through which, discharges its waters in the Frozen Ocean. He crossed the ridge from this plain through a pass, between rocky precipices, of no more than 817 paces over, to a lake, from whence its waters flowed to a branch of Frazer's River. Along the pass spruce and liards were growing. The canoe was carried over

* Of the trade and navigation of Russian America, we have given an account in another work, *Commercial Statistics*, vol. ii.

this portage and then crossed overland to another lake. They embarked on the lake, by a portage, on which was a growth of large fir and pine-trees, and many fallen ones. Their progress then became slow and arduous; the stream by which they descended was obstructed by terrific difficulties; they often had to cut a road through the thick forest, and make their way over swamps, in order to pass by the rocks, rapids, or other obstacles of the river; such as being choked up with fallen trees carried down by the floods. Their escapes appear almost marvellous. They were frequently in danger of wanting food, and lived on a limited allowance. The coolness and intrepidity of the leaders braved all physical dangers, and tempered the ferocity of unknown savages, until they finally reached the waters of the Pacific.

The climate of the country he passed over, was often foggy and wet, although in the middle of summer; but the vegetation was far more advanced than on the eastern side of the Rocky Mountains. Cedar, maple, hemlock, and other trees and shrubs, also appeared in a more northern latitude on the west than on the east, and the temperature, except on the mountains, was much warmer. The largest trees were lofty pines and wide-spreading cedars. They met red-deer and shot some. Their canoe was upset in the rapids, and often dashed against the rocks, and finally so shattered, that after frequent mending and patching, they were compelled to construct a new one; which they afterwards laid up, when they left the river to cross over-land to the Pacific. The account he gives of the tribes of natives is interesting; they appear to have degenerated, and they have greatly decreased in number, since that period. Among some of the tribes old age was venerated. Their burial-places were also held sacred. The first considerable stream which he met with, after leaving the canoe, abounded with fish. On the 17th of July, he descended into a beautiful valley, where ground hogs abounded. There was, at the same time, much snow on the mountains. One of which appeared of stupendous height. On reaching the first river flowing west, the cedar, pine, hemlock, and elder-trees, were of great size. The inner or glutinous part of the hemlock bark was scraped off for food by the natives. They were, by several tribes received hospitably, and feasted with salmon; of which there was an abundant supply. The tribes who feed on them did not eat the flesh of quadrupeds. These Indians were expert canoe-men. Neither chastity nor honesty were considered virtues. They stole an axe, but delivered it up afterwards. He descended the river in a canoe about forty-five feet in length, and accompanied by four natives. Some of the habitations on the banks were of large dimensions. The women were occupied in various acts of servitude, and in spinning thread made of the fibres of cedar-bark, beaten until it had the appearance of flax, making nets, &c. He disembarked at the Cascades, above which the canoe was left. Further down another canoe was obtained, and, on the evening of the 20th of July, reached the ebbing and flowing of the tide, and saw a

number of sea-otters in a bay about three miles wide. The white-headed eagle, black sea-gulls, and porpoises were seen. A large porcupine was shot, cooked, and eaten. The weather was cloudy; the rise of tide was about fifteen feet perpendicular. After proceeding down the inlet, and greatly annoyed by an insolent Indian, he had an altitude of the sun on the 22nd, which gave the latitude 52 deg. 20 min. 48 sec. There he painted on a rock, with red vermilion, his name and the date, and, on the following day, commenced his return homewards. He narrowly escaped assassination by the savage above alluded to, and others of his tribe. The observations of Sir Alexander Mackenzie have been confirmed by the extension of the North-West and Hudson Bay Company's posts, over the territory of Oregon; a vast region, but in which the fertile and cultivable soil would appear, from all accounts, to form but an exception to the general rule: that is either a naturally barren, rocky, sandy, or snow-clad mountain country. The harbours within Puget and Admiralty Sound, as explored by Captain Wilkes, offered abundant space and shelter: many of the shores of the harbours and the valleys of the rivers south of 48 deg. north, afford fertile tracts, but if we consider the great distance, whether by sea or by land, of Oregon and its harbours, from populous and thriving countries and markets, the dangerous entrance of the Columbia River, and the almost inaccessible coast from that river south to San Francisco, we are led to the conclusion, that there appears no region of equal area within the temperate zones of the earth, so worthless, so ill adapted for maintaining a great population in comfort, prosperity, or for attaining power, as Oregon and North California. We at the same time admit, that when the fertile parts of Oregon and California become through the enterprise of future generations as populously inhabited as they are capable of affording sustenance—either from the resources to be obtained from the soil, the forest, the sea, and the rivers—regions so extensive possess sufficient natural advantages to constitute a nation of no mean, nor inconsiderable power; and whether under a dependent, or independent, government, afford the ample means of subsistence to a large population, the foundation for which will no doubt be established by an Anglo-Saxon race.

CHAPTER XXIV.

SURVEY OF THE COLUMBIA RIVER, 1841, BY THE UNITED STATES EXPLORING EXPEDITION.

THE United States ship of war, *Peacock*, having been totally wrecked in attempting to enter the Columbia, Captain Wilkes afterwards fitted out the boats of that vessel, fully manned, with all the requisites for surveying duties and with an officer commanding each boat, in order to make a complete survey of that river. The operations were attended with more than ordinary difficulties. They encamped the first night on a small sandy island in the centre of the bay,

where their position was rendered uncomfortable by the sand which was drifted about by the wind. In the morning they were enveloped in a thick fog, and as the water of the Columbia was not fresh as low down as this point, they had to send a party for fresh water to Baker's Bay.

Captain Wilkes describes the tide as exceedingly strong, and having some apprehensions that the boats might lose their way, he thought it better to make for the Chinook shore, and follow it until they reached the Cape.

"It may seem strange," he says, "that this precaution should be taken, but it is necessary at all times, even in clear weather; for the tide is frequently so strong, that it cannot be stemmed by oars, and too much caution cannot be observed in passing across the bay. As little frequented as it is, many accidents have occurred to boats and canoes, by their being swept by the tide into the breakers on the bar, where all hands have perished. The Indians are very cautious, and it is only at certain times of the tide they will attempt to make the passage. We reached Baker's Bay in two hours, and formed our encampment—and here we determined to remain until the weather should become clear, and allow us to proceed with our duties."

During the occupation of Astoria by the expedition, Captain Wilkes observes, "the place became quite civilised-looking, in comparison to what it was on my first arrival, and a mart for all the commodities of the country. Besides our own men, there were many Indians to be seen lounging and moving about, seeking employment, or with some small articles to sell.

"Short excursions were made by many of us in the vicinity, and one of these was to visit the primeval forest of pines in the rear of Astoria, a sight well worth seeing. The soil on which this timber grows is rich and fertile, but the obstacles to the agriculturist are almost insuperable. The largest tree was thirty-nine feet six inches in circumference, eight feet above the ground, and had a *bark eleven inches thick*. The height could not be ascertained, but it was thought to be upwards of two hundred and fifty feet high, and the tree was perfectly straight."

When the Peacock was wrecked, the Kilamukes, Clatsops, and Chinooks were collected in the neighbourhood, it being the season of the fishery: many of these came with their families, and took up their abode near Astoria. They generally had for sale salmon, venison, sturgeon, moccassins, and mats.

When the crew first landed, eight or ten salmon might be bought for a cotton shirt, or its value in red or green baize; but the Indians soon found that higher prices might be obtained for the asking, and before the departure of the expedition from the Columbia River, the price was enhanced one-half.

Having completed all the arrangements, and the weather becoming fine, on the 16th Captain Wilkes resumed the survey. The stations being established,

and the triangulation completed, the tender, with two boats, was left to sound the bay outwards, while the remaining part of the force proceeded up the river, to continue the surveys in company with the vessels, Porpoise and Oregon (the latter purchased to replace the Peacock). Captain Wilkes found it necessary that both vessels should proceed up to Vancouver, in order to insure a more thorough outfit for the Oregon, and to afford the officers and men quarters at night to protect them during the sickly season that was approaching, and of which he had received very unfavourable accounts.

On the 18th of August, Captain Wilkes left Astoria, with the Porpoise and Oregon and anchored at Tongue Point, previously to crossing thence to the opposite side of the river, through the crooked channel, which was then believed to be the only passage by which a vessel of any class could ascend the stream.*

"On the 19th the vessels attempted to pass through this channel, but on entering it they both took the ground. The tide was at its full height, and soon began to fall, when the Porpoise began to heel over, until she fell on her beam-ends. We were in hopes that the night-tide would be sufficient to float her off, but we found its rise less by nearly a foot than that of the day: it therefore became necessary to make extraordinary exertions to prepare for the next day's tide, by buoying her up with casks." They finally succeeded in getting her off, and ran up the river a few miles, and anchored below the Pillar Rock, opposite Waikaikum: a large lodge, picketted around with planks belonging to a chief named Skamakewea.

The next morning, in proceeding up the river to carry on the survey, one of the small boats in tow of the Porpoise was, through the negligence of her crew, capsized. Every thing in her, except her oars, was lost, and the accident caused much detention.

In the afternoon they reached Katalamet Point, and anchored at the lower end of Puget Island, where they passed the next day (Sunday.) On Monday he resumed the surveying, and reached Oak Point, where the river takes a turn to the southward and eastward. Just before reaching Walker's Island, the Porpoise ran aground, from the pilot mistaking his marks, but they got her soon afloat. In the evening of the next day, they ascended to Mount Coffin, at the mouth of the Cowlitz. This mount afforded a favourable point for astronomical observations, being 710 feet high, and quite isolated. The canoes used by the Indians as coffins are hung up in every direction, in all stages of decay. They were suspended between trees, at the height of four or five feet above the ground, and about them were hung the utensils that had belonged to the deceased, or that had been offered as tokens of respect.

* A channel which he afterwards discovered leads directly upwards from Tongue Point, and affords every desirable facility for the navigation within the Columbia River.

Captain Wilkes remained the whole day on the top of the mount, and obtained a full set of observations, the sky being remarkably clear. An untoward circumstance happened at this place. "Here," says Captain Wilkes, "my boat's crew carelessly omitted to extinguish the fire they had used for cooking our dinner, and as we were putting off to the brig, I regretted to see that the fire had spread, and was enveloping the whole area of the mount, but there was no help for it. The fire continued to rage throughout the night, until the whole was burnt (viz., all the wood, canoes or coffins, with the dead bodies). I took the earliest opportunity of explaining to the Indians, who were in the neighbourhood, that the fire was accidental, and after receiving a few small presents, they appeared satisfied that it was so. But a few years earlier, the consequence of such carelessness would have been a hostile attack, that might have involved us in difficulty of no ordinary kind. We had a minor punishment to undergo, for the smoke was so great, that it enveloped all the signals towards the mouth of the river, and made it necessary for me to anchor within sight of Mount Coffin till the next morning."

Before reaching the mouth of the Willamette, better known here as the *Wapautoo Branch*, a long flat extends across the river, where Captain Wilkes was again unfortunately detained a few hours, by getting aground. Warriors Point, the locality where a Mr. Wyeth proposed to erect his great city of the west, was passed, and on the 28th, at sunset, the Porpoise and Oregon anchored off Vancouver. Sir George Simpson, governor of the Hudson Bay Company had, at the time, arrived overland from Canada on a tour of inspection, and on his way to visit the Russian settlement at Sitka.

The Columbia river was now greatly diminished from its swollen state during the flood season, May and June. The stream had fallen, and was confined within its narrowest limits, and was nineteen feet below high flood mark.

The Indians were encamped on the *strands*, over which the waters from the mountains had rolled in with irresistible force. Vancouver exhibited the aspect of an extensive farming establishment: the granaries, corn-stacks, showed the signs of an early and plentiful harvest.

While at Vancouver, Captain Wilkes was engaged in making astronomic and magnetic observations. The former gave its position in longitude 129 deg. 39 min. 34.6 min. west, and latitude 45 deg. 36 min. 33 sec. north.

On the 1st of September, Messrs. Eld and Colvocoressis, midshipmen, with Mr. Brackenridge and party arrived from their detached expedition and orders were given to them to explore the region through the Chickeeles country to Gray's Harbour, and afterwards to join Lieutenant Emmon's party on the Willamette, and for both to proceed by that route to California.

They left Nisqually on the 19th of July, and proceeded towards one of the south-west arms of Puget Sound in two wretched canoes.

On the same evening they all arrived within a short distance of the portage; and the next morning Mr. Colvocoressis went to an old squaw chief, who had promised at Nisqually to be their guide to the Sachal River, and to furnish horses and men to cross the portage.

The portage was easily accomplished: it passes through a forest of lofty spruce and maple trees, with an undergrowth of common hazel and spiræa; its length was four miles. The soil was composed of a shallow, black, sandy, vegetable earth.

On their route they passed over three small prairies. The lake called Sachal by the Indians, was examined, and found to be one mile and a half in length and three-fourths of a mile in breadth. It is surrounded on all sides by willows and alders; the soil about it was a light brown sandy loam. The forest extends down to the water.

After their return they broke up the encampment, and embarking in their canoes on Lake Sachal, passed to its southern end, where they entered the river of the same name. This appeared at first almost impassable, for it was for four miles almost choked up with sparganiums, &c., so that it was difficult to pass even with the small canoe. Its breadth was from twenty to sixty feet, and it was from three to twelve feet deep. The turns were sometimes so short, that the large canoe would be in contact with the thickets on the banks at both ends, and it required much force to drag it along, by pulling the branches, and great labour in cutting their way. They also unfortunately lost their hatchet, which afterwards proved a serious mishap.

They were obliged to continue their course down the river until nine o'clock at night, before they could find any place to encamp, on account of the bog and thicket. At that hour they came to a small green spot, occupied by a party of Indians. Here Mr. Eld obtained some altitudes of the north star for latitude, and the next day, being compelled to make a portage of two miles to avoid an impassable part of the river, he employed himself, during the time it was making, in getting a full set of equal altitudes. By six P.M., they had carried every thing across, and embarked; but the river was full of sand-bars, shallow rapids, and sunken snags, which often compelled them to drag the canoe over by main force. The land on both sides of the river was flat, marshy, and thickly wooded. Among the woods were many ash trees. They stopped for the night at an Indian camp.

On the 24th they again embarked on the river, and had another fatiguing day; but being provided with poles, they succeeded better in navigating the canoe. During the day they saw several deserted native huts, situated on small prairies, extending back some distance from the river, and in the rear, on either side, were seen hills rising to the height of about 1500 feet. No kind of

rock had been observed on their route, except a single block of granite, which was passed on one of the prairies near Lake Sachal.

On the 25th they set out at an early hour, and in passing one of the rapids in the large canoe, it came in contact with a snag, which tore off part of the gunwale, and half filled the canoe with water. At ten o'clock they reached the place where the Sachal enters the Chickeeles, which is there 150 feet wide, and runs with a rapid current. The bottom was gravelly, and the surface smooth, except where a sand and gravel bar stretched across the river in a direction about east-north-east. One lonely Indian was met at the junction, from whom they bought some pieces of dried elk.

The soil on both sides of the river, for about one-third of a mile back, was a deep rich alluvial loam, overgrown with poplar, willow, dogwood, and alder with an undergrowth of raspberry.

On the 26th, the old chief joined the party, and they all proceeded down the river together to the point where the Kluckallum enters the Chickeeles. Here they halted. No inducement could prevail upon the chief to serve as a guide up the Sachap, another branch of the Chickeeles.

In the afternoon they encamped at the mouth of the Sachap, and Mr. Eld made preparations to set out early the next morning to explore it, having obtained a guide from among the Indians they met with at a fishing station in the vicinity. No fish, however, were to be procured, but on their descent they came upon several large flocks of teal, of which Mr. Brackenridge killed four.

At an early hour they proceeded up the Sachap in a small canoe. About eight miles from the camp they came to the place where the river branches, forming the Sachap and Tarqucoran; here they took horses, and proceeded further in a north-easterly direction, and encamped on a small prairie. Both rivers were overgrown and choked up with bushes and mossy bogs; they passed a party of Suquamish Indians, who were very anxious that Mr. Eld should encamp with them; but this he declined doing, and preferred passing some distance beyond.

On the morning of the 28th, they again started at an early hour, and passed through a very rough, and apparently little frequented country. The guide had much difficulty in finding his way through a forest which the fire had partly consumed. At half-past nine they recrossed the Sachap, where it was about twenty feet wide, flowing from a north-west direction. It was but knee-deep, and clogged with large logs and trees. Shortly after passing the stream, the country grew so rough, that it was impossible to proceed further with the horses, and the guide told Mr. Eld, that he would be obliged to leave them.

This appearing suspicious, Mr. Eld led the chief aside, and told him that he intended to hold him responsible in case of the loss of any of his things, or of his being deceived. He then ordered him to leave one of the slaves in charge

of the horses and effects until their return. This was accordingly done, and they proceeded on foot for Lake Nanvitz, which was a mile and a half long, by three-fourths of a mile wide, surrounded by a thick forest of pines. Here they found an Indian family hunting, who had just killed an elk, of which Mr. Eld procured the greater part, for a small quantity of powder and shot. These were also of the Suquamish tribe. The next day he returned to the Chickeeles, passing on their route some of the gigantic pine trees, so often to be met within this territory.

Some of these had been burnt, and had in consequence fallen. One that was not selected as the largest, for there were many of equal, if not greater length and diameter, was measured, and the part that lay in one piece was found to be 200 feet long: another piece of the same tree was twenty-five feet long, and at the small end of the latter, it was still ten inches in diameter, allowing twelve feet for the portion destroyed by fire. Mr. Eld thought twenty-five feet ought to be added for its top, which would make the whole length of the tree, when growing, 260 feet. Others were believed to exceed this both in height and diameter.

During Mr. Eld's absence, Mr. Colvocoressis remained at the camp, and Mr. Brackenridge made short excursions to the south of the Chickeeles. The country on this side of the river is covered with a thick spruce forest, and the soil appears to differ much from that of the north, being a sterile mixture of sand and gravel. On the north side it consists of an alluvial deposit, from a half to two-thirds of a mile in width, well adapted to yield good crops of grain. From the marks on the trees, however, it is believed to be subject to an annual inundation of considerable height. The weather continued dry and clear.

In descending the Chickeeles, they perceived an ebb and flow of the waters. Mr. Eld tried its current, and found it setting flood about one fathom per hour. As they proceeded, the shores lost some of their luxuriance of foliage. The banks had become high, and so muddy, that they had some little difficulty in finding a suitable place to encamp. The bluffs on the south side of the river, appeared to consist of *talcosed* slate, so soft and fragile, that it could not be brought away unbroken. They encamped in a fir-grove, so thick over head, as to render it impossible for the usual nightly observations to be taken. The roar of the surf of the ocean was distinctly heard from the camp during the night.

On the 31st, after passing two bends of the river, the cape on the south entrance to Gray's Harbour was observed. They met the flood-tide, which was so very strong that they made but slow progress, and as they opened out the harbour and entered it, they found a strong south-west wind blowing, with an abrupt and difficult sea, in which their canoe was nearly swamped, and which compelled them to make the lee-shore. Here all the things were taken out and placed to dry, on one of the huge trees that had been brought down by the freshets. From

this awkward situation they were relieved by the old squaw chief, who had preceded them from Nisqually. She came over in her large canoe, with ten Indians, and offered to carry the party across to the western shores, where they might encamp in a less exposed place. The offer was accepted, and they were taken over to her village. Mr. Eld and his party had a great many difficulties to contend with in surveying Gray's Harbour. The Indians for some days were unwilling to aid in the management of their canoes, and none of them could be induced to venture out in what they deemed stormy weather, nor to leave their wives behind. It being finally conceded that their wives might accompany them, Mr. Colvocoressis embarked to join Mr. Eld, against the wind and sea; the Indians refused then to proceed unless they received an extra allowance of powder and tobacco. After remaining a few days, they selected another spot at the south head, on the 10th of August, the Indians failing to perform their engagements. The party had now very nearly exhausted their provisions, and were living on the dead fish they gathered along the beach (a sort of hake) and some berries. From continual exposure to wet, with hard work, as well as scanty and bad food, they all became feeble and sick, and were able to do but little work. On the 13th, Lieutenant De Haven, from the Columbia, joined the party, and relieved them; and on his return to Baker's Bay, twenty days' provisions were sent with a party of Kanakas, under the guidance of a Canadian.

The tract of land bordering on the Chickeeles, below the mouth of the Sachap, was found well adapted for agriculture. The spruce forest extends down to the water's edge, except in a few places around the harbour, where there are patches of salt-marsh, which produce coarse grasses and cat's-tail (*typha*). The salt-creeks, or ravines, into which the tide flows through the marshes, are generally tortuous; and the meadows are occasionally overflowed at spring-tides. The only piece of land at Gray's Harbour which appeared suitable for cultivation, was immediately within the south head; but this is of small extent. The coast, as far as Cape Shoalwater, is no more than a smooth sandy beach, which rises in a gentle acclivity to a line of low sand-hills.

GRAY'S HARBOUR seems to offer but few facilities for maritime purposes. The entrance is narrow, the width being from one-half to two-thirds of a mile, with dangerous breakers on both sides. The depth of water is from five to seven fathoms. After entering, the bay is extensive, but the greater part is filled up with mud flats, which are bare at low water, and confines the harbour suitable for the anchorage of vessels to an insignificant limit. The river Chickeeles, before flowing into the harbour, increases in breadth to several hundred feet, and is navigable for vessels drawing twelve feet water eight miles above its mouth. The harbour is only suitable for vessels of from 100 to 200 tons; and there are places where such vessels may find security between the mud-shoals some distance within the capes.

The tides are irregular, and influenced by the winds and weather; the time of high water at full and change was found to be 11 h. 30 min.

Fogs prevail on the coast during the summer-season. The party remained at this place for twenty-three days, three-fourths of which time it blew a strong gale from either the south-west or north-west, accompanied with a dense fog, that rendered it impossible to see further than half a mile.

The Indians in this portion of the country are not numerous. The region at the head of Puget Sound is inhabited by a tribe called the Toandos, whose number Mr. Eld was unable to learn.

This tribe lives principally on salmon, which are of excellent quality, and which they take during the season in vast quantities, in the Columbia. On the Chickeeles, and in its branches there are several fishing weirs and stakes. Sturgeon are also taken in great numbers.

From the circumstance of the party seldom receiving any venison from the Indians, or meeting with any, it was inferred there is but little game in this part of the country.

The party shot a few grouse, and some wild geese were seen, and the mud-flats were covered with white gulls in immense numbers, among which were a few pelicans.

On the 24th August, the expedition left Gray's Harbour, after having, by great perseverance and with much fatigue, completed the survey. Mr. Eld, in pursuance of his instructions, then proceeded to trace the coast around Cape Disappointment. The Indians whom he had hired to take the canoe around by water, preferred to pass close along the beach, inside the surf, by tracking the canoe: notwithstanding there was a heavy surf, they managed to pass along very quickly. This is the mode they always adopt in journeying along the coast with their canoes, to avoid accident from the heavy surf, which they greatly dread. The evening of the day on which they left Gray's Harbour, they reached a small islet, distant fifteen miles from Cape Shoalwater, where they found the lodge of the Chickeeles chief, who supplied them with dried salmon, &c.

The coast between Gray's Harbour and Cape Shoalwater is bordered by sand-hills, behind which, from the description given by the Indians, there are lagoons and streams of fresh water, in which plenty of beaver are found.

From this chief they hired another canoe, and accompanied by him they proceeded through Shoalwater Bay towards Cape Disappointment. The two canoes separated, which caused them to pass over the two portages between Shoalwater and Baker's Bay; that to the east is about four miles and a half in length, while that to the west is six or seven miles across. The former is usually preferred by the Indians, and is one of the main passes of communication between the different

tribes on the sea-coast. The woods through which they passed were of spruce-trees, some of which were of large dimensions. The lesser plants were principally vaccinium, ledums, and some candleberry-bushes (*myrica*).

On the 27th, they reached the Flying-Fish, then in Baker's Bay, and were taken over to Astoria.

HOOD'S CANAL; a long, well-sheltered inlet, and a principal arm of Admiralty Inlet, was also surveyed by another exploring party. It forms within two branches. The banks are about 100 feet high, and further upwards, rocky in some parts, and wooded; and in others, the soil fertile; but there are no very extensive cultivable tracts. It was formerly examined by Vancouver, but it extends ten miles further than his survey, and approaches eastward to within two miles and a half of Puget Sound; and at the southern extremity there is a large inlet, from which the Indians pass to the Columbia and to Chickeeles River. The water in the middle of this sound is too deep for anchorage; but it affords several good harbours: streams of good fresh water flow into the latter.

At the Observatory at Nisqually, the height of Mount Rainer was found to be, by trigonometrical measurement, 12,330 feet. Around Nisqually, there are beautiful rides, and the prairie ground in its natural state will admit carriages being drawn over it for several miles around the fort. The cattle are penned up at night to save them from the wolves.

Having completed the surveys of the numerous branches of Puget's Sound, they were all found to afford good harbours for the largest ships. The lands are generally low near the shore, and covered with trees, chiefly pines, besides other trees, as spruce, oaks, arbutus, &c. Beautiful flowers, decked the prairies and banks. The soil, in some places, good, in others light and sandy. At the heads of all the branches, there are mud flats and salt marshes. The spring tides in the sound, at Nisqually, rise about eighteen feet, the neap-tides about twelve feet. He considers Nisqually ill chosen, on account of the high banks and confined anchorage for a commercial town. The country around the inlets are considered very healthy. The Indians around the plain are addicted to stealing, lazy, and dirty; they live on fish and clams, which are abundant. Shoals of young herrings appear during the salmon-fishery. The former are used as bait to take the latter. A species of rock bird was found abundant, and some so large as to weigh fifty pounds.

Captain Wilkes then observes, "The surveying parties having returned, on the 14th of September, we took leave of Vancouver. After proceeding down to the mouth of the Willamette, we anchored for the purpose of finishing the soundings, and making an examination of the channels into which the river is here divided by a few islands. This work being completed, we dropped down several miles, to overtake the sounding parties. Here we

were a good deal annoyed from the burning of the prairies by the Indians, which filled the atmosphere with a dense smoke, and gave the sun the appearance of being viewed through a smoked glass. We were, fortunately, in a great degree, independent of it, as it was not necessary to see more than a short distance to discover the signals for the soundings. It, however, prevented me from verifying my astronomical stations, which I was desirous of doing."

On the 20th, Captain Wilkes descended the Columbia, and anchored again off Coffin Rock, near which he found a depth of twenty-five fathoms, which is the deepest water within the capes and bar of the entrance. This place is sixty miles from the mouth of the river, and eight miles above the confluence of the Cowlitz. The shores here are composed of trap and a conglomerate, the last of which is the same rock as that which occurs below. The Coffin Rock, which is not more than sixty feet in diameter, and twelve feet above the water appears to have been exclusively reserved for the burial of the chiefs. Dr. Holmes procured here some fine specimens of flat-head skulls. Captain Wilkes anchored the same evening off the Cowlitz; and early the next morning, proceeded up the Cowlitz in his gig, in order to finish the survey of that stream, and examine the strata of coal said to exist there. After entering it, it was with difficulty that he recognised the river, for there is greater difference than even in the Columbia, between its high and low floods. After passing up the Cowlitz several miles, he encountered rapids, through which it was necessary to drag the boat by a line. He found, after great exertion and fatigue, that he could not ascend beyond thirteen miles; for it had become so shallow that the boat would not float, and they had not strength enough to force her over the wide bars of gravel and sand, that had apparently accumulated during the previous spring. Some specimens of lignite were found embedded in the alluvial banks, and taking observations for time, he turned back. Feeling anxious to reach the brig at an early hour, he ventured to shoot one of the rapids. In doing this they all had a narrow escape; and particularly two of the boat's crew, who were in great danger of their lives. They fortunately escaped, but with considerable damage to the boat and a few bruises, the whole of which was the work of an instant. The Cowlitz is not navigable, except at high water during the spring and fall; and even then it is difficult to ascend, on account of the strength of its current. Having reached the influence of the tide below Oak Point, all fears of the ague and fever vanished.

On the 26th they reached Katalamet Point, the lower end of Puget Island. The brig passed down the usual channel on the south side, while Captain Wilkes surveyed the northern passage. The latter is about four miles in length. Puget Island affords no land fit for cultivation, and during the season of freshets is overflowed. It is fringed around its borders with cotton wood, willow, pine, and hazel, &c., but it may be considered valueless.

On the 29th of September they descended to the Pillar Rock, and on the 3rd of October passed through the Tongue Point channel. Before doing this, Captain Wilkes took the precaution to buoy it out, and then towed the vessel through at high water. This enabled him to lay down its tortuous course with accuracy, although he was aware that there is little probability of its remaining over the season without some material change. The new and direct channel discovered by them, leading up from Tongue Point, will, he thinks, supersede the necessity of using the old channel; and the new, from its direct course is more likely to be permanent; but he says the channels in this river will be always more or less subject to change, from the impediments the large trees drifting down cause, when they ground on the shoals.

The same evening they anchored about two miles above Astoria, and in order to lose no time, he proceeded there in his boat to make arrangements for getting off the stores, and embarking every thing previous to his departure from Oregon.

The Porpoise anchored at Astoria, and all were engaged in expediting the embarkation of stores on board of both vessels: the officers were detained temporarily to the Oregon, whilst the necessary observations for the chronometers and magnetisms were made. It now became important that the two larger vessels should be got to sea as early as possible. They, in consequence proceeded on the 2nd to Baker's Bay, whilst the boats were still employed under Lieutenant De Haven in taking soundings. Acting-master Knox and Midshipman Reynolds were ordered to the Porpoise and Oregon for the purpose of piloting them to sea when the earliest opportunity should serve. In Baker's Bay they found that the company's schooner, the Cadborough, had been waiting there three weeks for an opportunity to get over the bar.

As the Peacock's launch could not be taken away, although he at one time had intended to send her along the coast to San Francisco, Captain Wilkes found that the weather and advanced state of the season would have rendered such a voyage dangerous. He consequently provided her with every essential to fit her to be used as a pilot boat at the mouth of the river, or, for the relief of vessels in distress; and he wrote to Dr. M'Laughlin, placing the launch at his disposal, under the supervision of the company's officers for the above purposes. On the 5th the prospect of passing the bar was favourable, and at 2 h. 30 m. P. M. the company's bark Columbia—which had been lying off and on for the week, having just returned from the northern posts—entered, and proceeded up the river to Astoria. At 3 h. 30 m. the exploring vessels got under way, and in an hour afterwards passed the bar in safety.

The Cadborough followed and went to sea also. Her master had strong misgivings as to undertaking the risk at so late an hour both of the day and tide. The vessels of the Hudson Bay Company never attempt to pass either in or out un-

less the opportunity is such as will warrant the master in making the attempt. They consider that there is sufficient risk at the best of times, and are unwilling to increase it. Captain Wilkes says, "the Columbia is impracticable for two-thirds of the year. This arises from the fact that it can never be entered at night, and in the day only at particular times of the tide and direction of the wind. Unlike all known ports, it requires both the tide and wind to be contrary to insure any degree of safety.

Having succeeded in getting the brigs beyond the risk of detention, he gave them orders to await his return, and he then went on board the tender to pass again into the river, for the purpose of completing all that remained of the survey.

The survey was completed on the morning of the 10th of October, when Captain Wilkes returned to Baker's Bay, and being determined to lose no time, he made the attempt to pass the bar: though he succeeded in doing so, he says, "I am satisfied it was at great risk; for, as I have been told is frequently the case, the wind failed us just at the most critical point, and rendered it doubtful if we could pass. Our situation was dangerous, and a vessel of any other class must have been wrecked. For at least twenty minutes I was in doubt whether we could effect our object; but by the use of sweeps we accomplished it, principally through the exertions of the extra men belonging to the surveying boats, whom we had on board.

"The Oregon was the only vessel in sight, and when I boarded her, I learned that they had not seen the Porpoise for three days. The next day she hove in sight, and the arrangements were soon completed. I now supplied the tender with water and other requisites, and gave Mr. Knox orders to take a few more soundings on the outside of the bar, and then proceeded along the coast as far as latitude 42 deg. north, and to examine it, and the mouth of the Umpqua.

"On the night of the 15th we parted company with the Oregon, and did not see her again until she arrived at San Francisco. We coasted along to the southward in the Porpoise. The land is high and mountainous, and may be seen at a great distance. Soundings of dark sand are obtained in from thirty to forty fathoms water, about fifteen or twenty miles from the land.

"No ports exist along any part of it that are accessible to any class of vessels, even those of but very small draught of water, and the impediment that the constant and heavy surf offers along the whole coast to a landing in boats, makes this part of our territory comparatively valueless in a commercial point of view. Along a great part of it is an iron-bound shore, rising precipitately from the water. Anchorage in a few places may be had, but only in fair weather and during the fine season."

CHAPTER XXV.

EXPLORATION BY SPAIN OF THE NORTH-WESTERN COAST OF AMERICA.

Spanish vessels sailed along parts of the coast of America north of San Francisco, since the beginning of the seventeenth century, but the country was neglected until 1774, when surveys were ordered, and several expeditions made by Spain before 1792. The attempt to form a settlement at Nootka Sound nearly produced a war against Spain by England. In about 1786, Europeans frequented the coasts for sea-otter-skins, and, according to Alcedo, the rivalry in this trade was most disadvantageous for themselves and the natives of the country. "The price of the skins as they rose on the coast of America fell enormously in China. Corruption of manners increased among the Indians; and, by following the same policy by which the African coasts have been laid waste, the Europeans endeavoured to take advantage of the discord among the *tays* (chiefs). Several of the most debauched sailors deserted their ships to settle among the natives of the country. At Nootka, as well as at the Sandwich Islands, the most fearful mixture of primitive barbarity with the vices of polished Europe was observed. It is difficult to conceive that the few species of roots of the old continent transplanted into these fertile regions by voyagers, which figure in the list of the benefits that the Europeans boast of having bestowed on the inhabitants of the South Sea Islands, have proved any thing like a compensation for the real evils which they introduced among them.

"In the sixteenth century, when the Spanish nation, favoured by a combination of singular circumstances, freely displayed the resources of their genius and the force of their character; the problem of a passage to the north-west, and a direct road to the East Indies, occupied the minds of the Castilians with the same ardour displayed by some other nations afterwards. We do not allude to the apocryphal voyages of Ferrer Maldonado, Juan de Fuca, and Bartolome Fonte, to which for a long time only too much importance was given. The most part of the impostures published under the names of these three navigators were destroyed by the laborious and learned discussion of several officers of the Spanish marine." —(See Memoirs of Don Ciriaco Cevallos. Researches into the Archives of Seville, by Don Augustin Cean. Historical Introduction to the Voyage of Galiano and Valdes, pp. 49, 56, 76, and 83.)

The following sketches, partly drawn from the manuscript memoirs of Don Antonio Bonilla and M. Casasola, preserved in the archives of the viceroyalty of Mexico, present facts which, combined together, deserve attention.

Ulloa, under the Spanish flag, first explored the coast as far as 30 deg. north.

Juan Rodriguez Cabrillo explored the coast of New California to the 37 deg.

10 min., or the Punta del Ano Nuevo, to the north of Monterey. He perished (on the 3rd of January, 1543) at the island of San Bernardo, near the channel of Santa Barbara.—(Manuscript preserved in the Archivo-general de Indias at Madrid.) But Bartolome Ferrelo, his pilot, continued his discoveries north to the 43 deg. of latitude, until he saw the coast of Cape Blanc, called afterwards by Vancouver, Cape Orford. But there is some doubt as to whether Ferrelo sailed further than 40 deg. 20 min. north.

Francisco Gali, or De Gualle, in his voyage from Macao to Acapulco, discovered in 1582, the north-west coast of America, latitude 37 deg. 30 min. north (in the original *thirty-seven* and a half degrees in words, not in figures), not 57 deg. 30 min. as a translator has made it; and he beheld with great admiration, "The beauty of those colossal mountains, of which the summit is covered with perpetual snow, while their bottom is covered with the most beautiful vegetation." It was asserted from a translator's error that Gali coasted part of the archipelago of the Prince of Wales, or that of King George. That Sir Francis Drake sailed, in 1597, as far as the 48 deg. of latitude to the north of Cape Grenville, in New Georgia, is corroborated by the following passage. In the account of the voyage of Galiano and Valdes, printed at the royal printing-press, and published at Madrid, in 1802, by the order of the King of Spain, is this passage—"The true glory which the English navigator (Drake) may claim for himself is, *the having discovered the portion of coast comprehended between the parallels of 43 deg. and 48 deg.*, to which, consequently, the name of NEW ALBION ought to be limited, without interfering with the discoveries of preceding navigators."—('Relacion del Viage,' &c.)

Alcedo says, "Thirty-two maps, drawn up at Mexico by the cosmographer Henry Martinez, prove that Viscayno, in 1596, surveyed those coasts with more care and more intelligence than was ever done by any pilot before him. The diseases of his crew, the want of provision, and the extreme rigour of the season, prevented him, however, from ascending higher than Cape St. Sebastian, situated under the 42 deg. of latitude, a little to the north of the Bay of the Trinity. One vessel of Viscayno's expedition, the frigate commanded by Antonio Florez, alone passed Cape Mendocino. This frigate reached the mouth of a river in the 43 deg. of latitude, which appears to have been already discovered by Ferrelo in 1543, and which was believed by Martin d'Aguilar to be the west extremity of the *Straits of Anian*. We must not confound this entry or river of Aguilar, which could not be found again in our times, with the mouth of the Rio Columbia (latitude 46 deg. 15 min.), celebrated from the voyage of Vancouver, Gray, and Captain Lewis." D'Aguilar explored the coast in 1596 as far as 43 deg. north.

"The brilliant epocha of the discoveries made anciently by the Spaniards on the north-west coast of America ended with Gali, Viscayno, and D'Aguilar. The history of the navigations of the seventeenth century, and the first half of the

eighteenth, offers us no expedition directed from the coast of Mexico to the immense shore from Cape Mendocino to the confines of Eastern Asia. In place of the Spanish the Russian flag was alone seen to float in these latitudes, waving on the vessels commanded by two intrepid navigators, Behring and Tschiricow.

“At length, after an interruption of nearly 170 years, the court of Madrid again turned its attention to the coast of the Great Ocean. But it was not alone the desire of discoveries useful to science which roused the government from its lethargy. It was rather the fear of being attacked in its most northern possessions in New Spain; it was the dread of seeing European establishments in the neighbourhood of those of California. Of all the Spanish expeditions undertaken between 1774 and 1792, the two last alone bear the true character of expeditions of discovery. They were commanded by officers whose labours display an intimate acquaintance with nautical astronomy. The names of Alexander Malaspina, Galiano, Espinosa, Valdes, and Vernaci, will ever hold an honourable place in the list of the intelligent and intrepid navigators, to whom we owe an exact knowledge of the north-west coast of the new continent. If their predecessors could not give the same perfection to their operations, it was because, setting out from San Blas, or Monterey, they were unprovided with instruments and the other means furnished by civilised Europe.”—*Alcedo*.

The first exploring voyage made after the expeditions of Viscayno and D'Aguilar was that made by Juan Perez. From a manuscript journal, kept by two monks, Fray Juan Crespi, and Fray Tomas de la Pena, and for which Humboldt was indebted to the kindness of M. Don Guillermo Aguirre, a member of the *audiencia* of Mexico. It appears that Perez and his pilot, Estevan Jose Martinez, left the port of San Blas on the 24th of January, 1774, in order to examine all the coast from the port of San Carlos de Monterey to the 60th deg. of north latitude. They discovered on the 20th of July, the north-west point of Queen Charlotte's Island, and the strait which separates this island from that of the Prince of Wales. On the 9th of August, they anchored in an inlet, asserted to be Nootka Sound. They carried on barter with the natives, among whom they saw iron and copper. They exchanged with them axes and knives for skins and otter-furs. Perez did not land, however, on account of the rough weather and high sea. His cutter was nearly lost in the attempt; and the corvette only escaped by cutting its cables and abandoning its anchors to get into the open sea. “The natives,” says Father Crespi, “stole several articles belonging to M. Perez and his crew.” This may account for the European silver spoons found by Captain Cook, in 1778, in the possession of the Indians of Nootka. M. Perez returned to Monterey on the 27th of August, 1774, after a cruise of eight months. There appears, however, obscurity as to whether Perez entered the bay known as Nootka, or some other inlet.

In 1775, an expedition sailed from San Blas, under the command of Don

runo Heceta, Don Juan d'Ayala, and Don Juan de la Bodega y Quadra. The narrative of this voyage is to be found in the journal of the pilot, Maurelle, attached to the instructions to the unfortunate La Perouse. Quadra is said to have discovered the mouth of the Rio Columbia, called Entrada de Heceta, the Pic of San Jacinto (Mount Edgecumbe), near Norfolk Bay, and the port of Bucareli (latitude 55 deg. 24 min.). Quadra believed that Drake anchored there at the De la Bodega.

Quadra and Don Ignacio Arteaga sailed from the port of San Blas, on the 11th of February, 1779. During this interval, Cook explored the coast. Quadra and the pilot, Don Francisco Maurelle, carefully examined the port De Bucareli, saw Mont Sant Elias, and the island De la Magdalena, called by Vancouver, Hinchinbrook Island (latitude 60 deg. 25 min.), situated at the entry of Prince William's Bay, and the whole island of Regla, in Cook River. The expedition returned to San Blas on the 21st of November, 1779.

No further attempts were made at discovery by Spain until 1788, when two Spanish vessels, the frigate *La Princesa*, and the packet-boat *San Carlos*, commanded by Don Esteban Martinez and Don Gonzalo Lopez de Haro, left the port of San Blas with the design of examining the position and state of the Russian establishments on the north-west coast of America. The existence of these establishments, of which it appears that the court of Madrid had no knowledge till after the publication of the third voyage of Cook, gave the greatest uneasiness to the Spanish government. The fur-trade drew numerous English, French, and American vessels towards a coast which, before the return of Lieutenant King to London, had been as little frequented by Europeans, as New Holland had previously been.

Martinez and Haro sailed on the 8th of March, and returned on the 5th of December, 1788. They sailed direct from San Blas to the entry of Prince William, called by the Russians the Gulf Tschugatskaja. They visited Cook River, the Kichtak (Kodiak) Islands, Schumagin, Unimak, and Unalaschka (Alaska). They were very kindly treated at the different factories which they found established in Cook River and Unalaschka, and even received several maps of the coast drawn up by the Russians. Humboldt discovered among the archives of the viceroyalty of Mexico, a large volume, in folio, in manuscript, entitled, "Reconocimiento de los quatro Establecimientos Russos al Norte de la California, hecho en 1788." The account of the voyage of Martinez, in this manuscript, furnishes, however, few data relative to the Russian colonies. Not understanding a word of the Russian language, the Spaniards could only make themselves understood by signs.

Since the time that Cook, Dixon, Portlock, Mears, and Duncan, explored the country, Europeans began to consider the port of Nootka as the principal fur entrepôt on the north-west coast of America. The court of Madrid, in 1789, in-

structed M. Martinez to form an establishment at Nootka, and to examine the coast comprised between 50 deg. to 55 deg. north latitude.

Don Esteban Martinez, commanding the frigate *La Princesa*, and the packet-boat *San Carlos*, anchored in the port of Nootka on the 5th of May, 1789. He was received in a very friendly manner by Macuina. Macuina, the Tays of the island, described as an absolute authority, is the Montezuma of these countries; and celebrated among all the nations who carry on the sea-otter skin trade.

Martinez two months after his entry into Nootka, saw the arrival of an English vessel, the *Argonaut*, commanded by James Colnet, known by his observations at the Galapagos Islands. Colnet showed the Spanish navigator the orders which he had received from his government to establish a factory at Nootka, to construct a frigate and a cutter, and to prevent every other European nation from interfering with the fur trade. The dispute between the commanders of the *Argonaut* and the *Princesa* was near occasioning a rupture between the courts of London and Madrid. Martinez arrested Colnet, and sent him by *San Blas* to the city of Mexico. "The true proprietor of the Nootka country, the Tays Macuina, declared himself prudently for the vanquishing party; but the viceroy, who deemed it proper to hasten the recall of Martinez, sent out three other armed vessels in the commencement of the year 1790, to the north-west coast of America." Martinez had previously seized the English vessels, *Iphenise* and *North America*, and afterwards the *Princess Royal* was taken possession of.

"Don Francisco Elisa, and Don Salvador Fidalgo, the brother of the astronomer who surveyed the coast of South America, from the mouth of the Dragon to Portobello, commanded this new expedition. M. Fidalgo visited Cook Creek and Prince William's Sound."—*Alcedo*.

Don Francisco Elisa remained at Nootka to enlarge and fortify the establishment founded by Martinez in the preceding year. But by the treaty signed at the *Escurial* on the 28th of October, 1790, Spain had desisted from further pretensions to Nootka and Cox Channel in favour of the court of London. "The frigate *Dedalus*, which brought orders to Vancouver to watch over the execution of this treaty, only arrived at the port of Nootka in the month of August, 1792, when Fidalgo was employed in forming a second Spanish establishment to the south-east of the island of Quadra, on the continent, at the port of Nunez Gaona, or Quinacamet, situated under the 48 deg. 20 min. of latitude, at the creek of Juan de Fuca."—*Alcedo*.

The expedition of Elisa was followed by two others, that of Malaspina in 1791, and that of Galiano and Valdes in 1792.

The explorations of Malaspina and the officers under him, embrace an immense extent of coast from the mouth of the Rio de la Plata to Prince William's Sound. This able navigator, after examining both hemispheres, and escaping all the dangers of the ocean, was confined six years in a dungeon, the victim of a political intrigue.

He obtained his liberty through the French government, and returned to his native country (Tuscany) on the banks of the Arno.

"The labours of Malaspina," says Alcedo, "remain buried in the archives, not because the government dreaded the disclosure of secrets, the concealment of which might be deemed useful, but that the name of this intrepid navigator might be doomed to eternal oblivion. Fortunately, the directors of the Deposito Hydrografico of Madrid (established by a royal order on the 6th of August, 1797), have communicated to the public the principal results of the astronomical observations of Malaspina's expedition. The charts which have appeared at Madrid since 1799 are founded in a great measure on those important results; but instead of the name of the chief, we merely find the names of the corvettes, *La Descubierta* and *L'Atrevida*, which were commanded by Malaspina."

He sailed from Cadiz on the 30th of July, 1789, and arrived at the port of Acapulco on the 2nd of February, 1791. At this period the court of Madrid again turned its attention to a subject which had been under dispute in the beginning of the seventeenth century, the pretended straits by which the imposter, Maldonado, was said to have passed in 1588 from the Labrador coast to the Great Ocean. A memoir read by M. Buache, at the Academy of Sciences, received the belief of the existence of such a passage; and the corvettes, *La Descubierta* and *L'Atrevida*, received orders to ascend to high latitudes on the north-west coast of America, and to examine all the passages and creeks which interrupt the continuity of the shore between the 53rd deg. and 60th deg. of latitude. Malaspina, accompanied by the botanists Haenke and Nee, sailed from Acapulco on the 1st of May, 1791. After a navigation of three weeks he reached Cape St. Bartholomew, which had been sailed close to by Quadra in 1775, by Cook in 1778, and in 1786 by Dixon. He surveyed the coast from the mountain of San Jacinto, near Cape Edgecumbe (Cabo Eñgano), lat. 57 deg. 1 min. 30 sec. to Montagu Island, opposite the entrance of Prince William's Sound. During the course of this expedition, the length of the pendulum and the inclination and declination of the magnetic needle were determined on several points of the coast. The elevation of St. Elies and Mount Fairweather (or Cerro de Buen Tempo), which are the principal summits of the northern *cordillera*, were measured by trigonometrical observation: the height of the former was calculated at 17,850, and of the second 14,992 feet.

After an attempt to discover the straits mentioned in the apocryphal narrative of the voyage of Maldonado, and after remaining some time at Behring's Bay (lat. 59 deg. 34 min. 20 sec.), Malaspina returned south, and anchored at Nootka on the 13th of August, sounded the channels, and determined by celestial observations the positions of Nootka, Monterey, San Lucas, and the island of Guadaloupe, and returned to San Blas and Acapulco in October, 1791.

This voyage of six months was of too short duration for discovering and sur-

veying the extensive coasts, afterwards so carefully examined by Vancouver, but the longitude and latitude of four points of the coast, Cape San Lucas, Monterey, Nootka, and Port Mulgrave, were ascertained by Malaspina. Intermediate points were connected with these fixed points. By the aid of "four sea-watches," as they were called, made by Arnold, many places were laid down according to calculations based on the difference of time. The information, received from the officers stationed at Nootka, revived the probability of the existence of the De Fuca Channel. Martinez had, in 1774, observed a broad opening in about 48 deg. 20 min. of north latitude. This opening was successively visited by the pilot of the *Gertrudis*, by Manuel Quimper, and in 1701 by Elisa. In order to complete a survey of this inlet, the *galeras* *Sutil* and *Mexicana* sailed from Acapulco on the 8th of March, 1792, under the command of Dionisio Galiano and Cayetano Valdes.

They passed, and employed four months in exploring the several channels, inlets, and shores, within the Straits of Fuca, and the channel Del Rosario, called by the English the Gulf of Georgia; they met the English navigators Vancouver and Broughton, who had previously entered, and who were engaged in exploring the same coast and channels. The British and Spanish expeditions made a mutual and unreserved communication of their discoveries; "they assisted one another in their operations; and there subsisted among them till the moment of their separation a good intelligence and complete harmony, of which, at another epocha, an example had not been set by the astronomers on the ridge of the *cordilleras*."—*Alcedo's Narrative of Voyages, &c.*

Vancouver, in 1792, thoroughly surveyed all the inlets within the island which bears his name, and there is little doubt that he was the first European who sailed round it. The smallness of the Spanish vessels were objects of surprise to him.

Galiano and Valdes, on their return from Nootka to Monterey, examined the mouth of the river Ascencion, Columbia, which Don Bruno Eceta was said to have discovered on the 17th of August, 1775, and afterwards was called the Colombia by the American navigator Gray, who in 1792 was the first who passed over its dangerous bar. During the same year Mr. Broughton, under the direction of Vancouver, ascended and surveyed the Columbia—*See Vancouver's Voyages*. Vancouver who had previously kept very close to this coast, was unable to discern an entrance from the 45th deg. of latitude to the channel of Fuca.

In 1797, the Spanish government gave orders that charts, drawn by Galiano and Valdes, should be published, "in order that they might be in the hands of the public before those of Vancouver." The publication was not made until 1802: when the charts of Vancouver and those of the Spanish navigators and the Russian chart published at Petersburg in 1802, in the dépôt of the maps

and charts of the emperor, were all about the same time given to the world. An examination of those maps is curious ; for, the same capes, the same channels and inlets, and the same islands, frequently bear three or four different names.

About the same time Revillagigedo despatched another expedition from Mexico, for higher latitudes. The mouth of the river of *Martin d' Aguilar* had been unsuccessfully sought for in the vicinity of Cape Orford and Cape Gregory. Malaspina, in place of the channel De Maldonado, discovered inlets with terminations. Galiano and Valdes had ascertained that the pretended Strait of Fuca was merely an arm of the sea. Cook regretted his want of ability to examine the continent called afterwards New Hanover by Vancouver ; and the assertions of Colnet rendered it probable that the continuity of the coast was interrupted by a great inlet, which might extend to the North Atlantic. To ascertain the fact, the Viceroy of New Spain ordered Jacinto Caamaño, commander of the frigate *Aranzazu*, to examine the coast from 51 deg. to 56 deg. north latitude. Caamaño sailed from San Blas on the 20th of March, 1792 ; and surveyed the north part of Queen Charlotte's Island, the south coast of the Prince of Wales's Island, which he called *Isla de Ulloa*, the islands of Revillagigedo, of Banks (or *De la Calamidad*), and of Aristizabal, and the inlet of Moniño. The number of Spanish names retained by Vancouver in his charts prove that the expeditions which we have enumerated, explored the north-west coast of America with tolerable accuracy. The foregoing include from 45 deg. north latitude, to Cape Douglas in the east of Cook's river.

The foregoing were the voyages undertaken, as far as we can ascertain, by the Spaniards, to explore the coast of America, north of New California, from the year 1553 down to the end of the eighteenth century. Vancouver's and Cook's surveys appear however to have been the most complete, at least so far as the different exploring expeditions have been communicated to the world.

Geographers have divided the north-west coast of America into an English part, a Spanish part, and a Russian part. These divisions have been made without any respect to the different tribes who inhabit those countries.

It is remarked with much justice, in Thomson's edition of Alcedo, " If the puerile ceremonies which the Europeans call taking possession, and if astronomical observations made on a recently discovered coast, could give rights of property, this portion of the new continent would be singularly pieced out and divided among the Spaniards, English, Russians, French, and Americans. One small island would sometimes be shared by two or three nations at once, because each might have discovered a different cape of it. The great sinuosity of the coast between the parallels of 55 deg. and 60 deg. embraces the successive discoveries of Gali, Behring, and Tschirekow, Quadra, Cook, La Perouse, Malaspina, and Vancouver !"

When Alcedo wrote, " the west coast of America," he says, " affords the

only example of a shore of 1900 leagues in length, inhabited by one European nation. The Spaniards have formed establishments from Fort Maulin in Chile to St. Francis in New California. To the north of the parallel of 38 deg. succeed independent Indian tribes. It is probable that these tribes will be gradually subdued by the Russian colonists, who, towards the end of the last century, passed over from the eastern extremity of Asia to the continent of America. The progress of these *Russian Siberians* towards the south ought naturally to be more rapid than that of the Spanish Mexicans towards the north. A people of hunters, accustomed to live in a foggy and excessively cold climate, find the temperature of the coast of New Cornwall very agreeable; but this coast appears an uninhabitable country, a polar region, to colonists from a temperate climate, from the fertile and delicious plains of Sonora and New California."

This prophecy in respect to Russia has not been realised. No permanent settlement south of latitude 59 deg. north has been made by Russia. That in the Bay of Bodega having, as already stated, been abandoned.

Vancouver's and Queen Charlotte's Islands.—With the exception of the descriptions of Nootka by Cook, and the surveys of Vancouver, we have little that gives us a satisfactory knowledge of the islands which extend along the north-western coast of America, south of the Russian settlements.

Captain Wilkes, during the exploring expedition which he commanded, surveyed but a very limited portion of Vancouver's Island, and he had little to remark in addition to the description by Vancouver, which, he says, applies correctly at this day.

Vancouver Island extends from south-east to north-west, between latitudes 48 deg. 15 min. north, and 51 deg. 30 min. north; and longitudes 122 deg. 30 min. and 128 deg. 15 min. west. Cook, in approaching, on the 29th of March, the island in latitude 49 deg. 29 min. north, says, "The country is full of high mountains, whose summits were covered with snow, but the valleys between them and the sea-coast, high as well as low, were covered to a considerable extent with high straight trees that formed a beautiful prospect, as if one vast forest." The natives of Nootka, who traded freely with him in furs and skins, were the most expert thieves ever met with. The natives of Vancouver's Island, and especially those of Nootka Sound, were also noted, by Vancouver, for their thievish disposition. They appear to have been, and to have continued, a ferocious, cruel race. The attack upon, and massacre of the crew of the American ship *Tonquin*, constitutes one of the most shocking atrocities which has occurred in the history of America.*

* The *Tonquin* sailed from the Columbia on the 5th of June, 1811, on a trading speculation to the northward; and Mr. M'Kay (who had accompanied Sir Alexander Mackenzie in his perilous journey across America in 1793) took on board, as an interpreter, a native of Gray's Harbour, who was well acquainted with the various dialects of the tribes on the coast. From this Indian the following particulars were learned:—"A few days after their departure from the Columbia they anchored opposite a large village, named New Whitty, in the vicinity of Nootka, where Mr. M'Kay immediately opened a trade with the natives. He went on shore with

There is much timber growing on Vancouver's Island and the lands south of 48 deg. 8 min., which border the numerous inlets within it; and some parts of this large island are described as well adapted for agriculture. But its mountainous and rocky districts occupy a great part of its area. Its harbours, its

a few men; was received in the most friendly manner, and slept a couple of nights at the village. During this period several of the natives visited the vessel with furs. The unbending manners of the captain were not calculated to win their esteem; and having struck one of their principal men whom he had caught in a theft, a conspiracy was formed by the friends of the chief to surprise and cut off the vessel. The faithful interpreter, having discovered their designs, lost no time in acquainting Mr. M'Kay, who instantly hurried on board for the purpose of warning the captain of the intended attack. That evening Mr. M'Kay told the interpreter that the captain only laughed at the information, and said he could never believe that a parcel of lazy, thieving Indians would have the courage to attack such a ship as his. The natives, in the mean time, apprehensive from Mr. M'Kay's sudden return that their plans were suspected, visited the ship in small numbers, totally unarmed, in order to throw our people off their guard. Even the chief who had been struck by Captain Thorn, and who was the head of the conspiracy, came on board in a manner seemingly friendly, and apparently forgetful of the insult he had received. Early in the morning of the day previous to that on which the ship was to leave New Whitty, a couple of large canoes, each containing about twenty men, appeared alongside. They brought several small bundles of furs; and, as the sailors imagined they came for the purpose of trading, were allowed to come on deck. Shortly after another canoe, with an equal number, arrived also with furs; and it was quickly followed by two others, full of men carrying beaver, otter, and other valuable skins. No opposition was made to their coming on board; but the officer of the watch perceiving a number of other canoes pushing off, became suspicious of their intentions, and warned Captain Thorn of the circumstance. He immediately came on the quarter-deck, accompanied by Mr. M'Kay and the interpreter. The latter, on observing that they all wore short cloaks or mantles of skins, which was by no means a general custom, at once knew that their designs were hostile, and told Mr. M'Kay of his suspicions. That gentleman immediately apprised Captain Thorn of the circumstances, and begged of him to lose no time in clearing the ship of the intruders. This caution was however treated lightly by the captain, who remarked, that with the arms they had on board they would be more than a match for three times the number. The sailors in the meantime had all come on deck, which was crowded with the Indians, who completely blocked up the passages, and obstructed the men in the performance of their various duties. The captain requested them to retire, to which they paid no attention. He then told them he was about going to sea, and had given orders to the men to raise the anchor; that he hoped they would go away quietly: but if they refused he should be compelled to force their departure. He had scarcely finished, when at a signal given by one of the chiefs, a loud and frightful yell was heard from the assembled savages, who commenced a sudden and simultaneous attack on the officers and crew with knives, bludgeons, and short sabres, which they had concealed under their robes. Mr. M'Kay was one of the first attacked. One Indian gave him a severe blow with a bludgeon, which partially stunned him; upon which he was seized by five or six others, who threw him overboard into a canoe alongside, where he quickly recovered, and was allowed to remain for some time uninjured. Captain Thorn made an ineffectual attempt to reach the cabin for his fire-arms, but was overpowered by numbers. His only weapon was a jack-knife, with which he killed four of his savage assailants by ripping up their bellies, and mutilated several others. Covered with wounds, and exhausted from the loss of blood, he rested himself for a moment by leaning on the tiller wheel, when he received a dreadful blow from a weapon called a *pautumaugan* on the back part of the head, which felled him to the deck. The death-dealing knife fell from his hand; and his savage butchers, after extinguishing the few sparks of life that still remained, threw his mangled body overboard. On seeing the captain's fate, our informant, who was close to him, and who had hitherto escaped uninjured, jumped into the water, and was taken into a canoe by some women, who partially covered his body with mats. He states that the original intention of the enemy was to detain Mr. M'Kay a prisoner; and after securing the vessel, to give him his liberty, on obtaining a ransom from Astoria; but on finding the resistance made by the captain and crew, the former of whom had killed one of the principal chiefs, their love of gain gave way to revenge, and they resolved to destroy him. The last time the ill-fated gentleman was seen, his head was hanging over the side of a canoe, and three savages, armed with *pautumaugans*, were battering out his brains. In the meantime the devoted crew, who had maintained the unequal conflict with unparalleled bravery, became gradually overpowered. Three of them, John Anderson, the boatswain, John Weekes, the carpenter, and Stephen Weekes, who had so narrowly escaped at the Columbia, succeeded, after a desperate struggle, in gaining possession of the cabin, the entrance to which they securely fastened inside. The Indians now became more cautious, for they well knew there

woods, its limited cultivable soils, its wild animals, and its fisheries, with those of the adjacent coast, and with Queen Charlotte's Island, and several other islands, and the coast northward, may, at some distant period, afford sufficient advantages for occupation and settlement. But as far as all the descriptions which we have of the islands and regions of the north-west coast of America extend, north of about latitude 48 deg. 30 min., their value for agricultural purposes must be considered as utterly insignificant.

were plenty of fire-arms below ; and they had already experienced enough of the prowess of the three men while on deck, and armed only with handspikes, to dread approaching them while they had more mortal weapons at their command. Anderson and his two companions seeing their commander and the crew dead and dying about them, and that no hope of escape remained, and feeling moreover the uselessness of any further opposition, determined on taking a terrible revenge. Two of them, therefore, set about laying a train to the powder magazine, while the third addressed some Indians from the cabin windows, who were in canoes, and gave them to understand that if they were permitted to depart unmolested in one of the ship's boats, they would give them quiet possession of the vessel without firing a shot ; stipulating however that no canoe should remain near them while getting into the boat. The anxiety of the barbarians to obtain possession of the plunder, and their disinclination to risk any more lives, induced them to embrace this proposition with eagerness, and the pinnace was immediately brought astern. The three heroes having by this time perfected their dreadful arrangements, and ascertained that no Indian was watching them, gradually lowered themselves from the cabin windows into the boat ; and having fired the train, quickly pushed off towards the mouth of the harbour, no obstacle being interposed to prevent their departure. Hundreds of the enemy now rushed on deck to seize the long-expected prize, shouting yells of victory ; but their triumph was of short duration. Just as they had burst open the cabin door, an explosion took place, which in an instant hurled upwards of two hundred savages into eternity, and dreadfully injured as many more. The interpreter, who had by this time reached land, states he saw many mutilated bodies floating near the beach, while heads, arms, and legs, together with fragments of the ship, were thrown to a considerable distance on the shore. The first impression of the survivors was, that the Master of Life had sent forth the Evil Spirit from the waters to punish them for their cruelty to the white people. This belief, joined to the consternation occasioned by the shock, and the reproaches and lamentations of the wives and other relatives of the sufferers, paralysed for a time the exertions of the savages, and favoured the attempt of Anderson and his brave comrades to escape. They rowed hard for the mouth of the harbour, with the intention, as is supposed, of coasting along the shore to the Columbia : but after passing the bar, a head wind and flowing tide drove them back, and compelled them to land late at night in a small cove, where they fancied themselves free from danger ; and where, weak from the loss of blood, and the harassing exertions of the day, they fell into a profound sleep. In the meantime the terror of the Indians had in some degree subsided, and they quickly discovered that it was by human agency so many of their warriors had been destroyed. They therefore determined on having the lives of those who caused the explosion ; and being aware from the state of the wind and tide that the boat could not put to sea, a party proceeded after dark cautiously along the shore of the bay, until they arrived at the spot where their helpless victims lay slumbering. Bleeding and exhausted, they opposed but a feeble resistance to their savage conquerors ; and about midnight their heroic spirits mingled with those of their departed comrades. — *Cor's Columbia*.

Extract of a letter dated Oregon, July, 1829.

" The number of lives lost last winter is incredible, particularly in your old department the Columbia.

" The Company's ship, after a tolerably quick passage from England, was lost on the bar, and the entire crew, twenty-six in number, were inhumanly butchered by the Clatsops.

" Your friend Ogden, in a hunting excursion, was attacked by a party of the Blackfeet, who killed four of his men ; and six of the people stationed at New Caledonia were murdered by the Carriers during the winter.

" Two American parties, under the command of Messrs. Smith and Tulloch, were completely cut off ; not a soul escaped ; and property to a considerable amount fell into the hands of the savages.

" These misfortunes have considerably weakened our influence with the Indians on the Columbia, whose behaviour, in consequence, has become very bold and daring, and we greatly fear the ensuing winter may be productive of more disasters.

" We shall have much difficulty in filling up the appointments for that district next spring ; in

CHAPTER XXVI.

RUSSIAN-AMERICA.

ON the coast of North America, along Behring's Straits, between 67 deg. and 64 deg. 10 min. of latitude, under the parallels of Lapland and Iceland, there have long been established a great number of posts or rather huts frequented by the Siberian hunters. These, from north to south, were principally at Kigiltach, Leglelachtok, Tuguten, Netschich, Tehinegriun, Chibalech, Topar, Pintepata, Agulichan, Chavani, and Nugran, near Cape Rodney (Cap du Parent).

The extensive region, considered under Russian dominion, is a country of islands, ice, rocks, barrens, pine, and beech forests. Its boundaries are supposed to be Dixon's Inlet, in about latitude 54 deg. north; and, including several islands, and a narrow strip along the coast to Mount St. Elias, in latitude 60 deg. 20 min., and thence separated from British America by a line running due north, along the meridian of longitude 141 deg. west to the Arctic Sea, comprising the whole region from that meridian west to Behring's Straits, and including the peninsula of Aliaska and the Aleutian Islands. The following remarks were drawn up in 1837, by an officer of the Hudson Bay Company, and in most respects apply to the present time, with the exception that the post of Bodega, on the coast of Mexico, has been sold to a Swiss adventurer, and that several Swiss and Germans have settled there.

"The Russian Fur Company's principal establishment on the north-west coast is named 'New Archangel,' formerly Sitka, and situated in Norfolk Sound, in north latitude 57 min., west longitude 132 deg. 20 min. It is maintained as a regular military establishment, garrisoned by about 300 officers and men, with good natural defences, mounting sixteen short eighteen, and twelve long nine-pounders, and is the head-quarters of the governor, Captain Kaupryanoff, of the Russian army. The Russians have other establishments on the coast and islands to the northward of New Archangel, and one fort, Ross, in the Bay of Bodega, or Romanzoff, on the coast of California, situated near the entrance of the Bay of San Francisco, in latitude 37 deg. 25 min.; in all, ten establishments on the north-west coast of America. They have, moreover, twelve vessels from 100 up to 400 tons' burden, armed with ten guns each of different calibre. All the officers

fact, symptoms of rebellion have already begun to manifest themselves, and several of our gentlemen have been heard to declare, that in the event of their being nominated to the Columbia, they will retire from the service sooner than risk their lives among such sanguinary barbarians.—God speed them! I say. Numbers of them have been long enough enjoying idleness and luxury on the east side of the mountains, and it is only fair they should experience some of our Columbian privations.—I have had my full share of them, and am therefore under no apprehensions of being ordered there in a hurry."

and most of the people employed in their sea and land service belong to the Russian army and navy; receive pay from the Russian government, and their services, while attached to the Russian Fur Company, entitle them to the advantages of promotion, pension, &c., in like manner as if employed on active service in the army and navy. They have, moreover, attached to these establishments a number of Indians of the Kodiak tribe, who are usually employed in hunting or fishing, but are under no fixed engagement, and are looked upon and considered as slaves. Their annual returns in fur are in value from 80,000*l.* to 100,000*l.*

CHAPTER XXVII.

ABORIGINAL TRIBES OF OREGON.

THE aborigines of Oregon are, from all accounts, decreasing in numbers, and degenerating in character. They were, from the time they were first visited by Europeans, notorious thieves, and generally cruel and treacherous. Filthiness and laziness are characteristic of most of the Oregon tribes, though some are far more barbarous than others. They have adopted scarcely any of the virtues of European civilisation, nor have they imitated even their vices, with the exception of the ready indulgence of drinking ardent spirits, and the use of tobacco. The former was unknown to their ancestors, and although the use of tobacco was known among the southern and eastern aborigines of America, it is doubtful if it was known to the nations west of the Rocky Mountains. The different tribes have their several rites, and superstitions, and barbarities. Nor does it appear that the Christian missionaries have been successful in their labours.* Some

* Speaking of the missionary, Captain Wilkes says of a village up the Klackamus, its inhabitants number about forty-five individuals. Mr. Waller went there to preach, and about half the inhabitants of the village attended. The chief was the interpreter, and was thought to have done his office in rather a waggish sort of manner. Preaching to the natives through an interpreter is at all times difficult, and especially so when the speaker has to do it in the Indian jargon of the country. This village has been disputed ground between Mr. Waller and Mr. Bachelét (two missionaries).

To the generally bad character of the Oregon tribes, there have been known some individual exceptions.

"During my stay at Vancouver," says Captain Wilkes, "I frequently saw Casenove, the chief of the Klackatack tribe. He lives in a lodge near the village of Vancouver, and has always been a warm friend of the whites. He was once lord of all this domain. His village was situated about six miles below Vancouver, on the north side of the river, and within the last fifteen years was quite populous: he then could muster four or five hundred warriors; but the ague and fever have within a short space of time swept off the whole tribe; and it is said that they all died within three weeks. He now stands alone, his land, tribe, and property, all parted, and he left a dependent on the bounty of the Company. Casenove is about fifty years of age, and a noble and intelligent-looking Indian. At the fort he is always welcome, and is furnished with a plate at meal-times at the side-table. I could not but feel for the situation of one who, in the short space of a few years, has lost not only his property and importance, but his whole tribe and kindred, as I saw him quietly enter the apartment, wrapped in his blanket, and take his seat at

tribes are far more daring and intrepid than others. The most degraded are those who live chiefly on roots, and known by the name of diggers. The boldest are those inhabiting Vancouver's and Queen Charlotte's Islands; and those southward about the opposite inlets, near the point where Sir Alexander Mackenzie, after crossing America from Canada, arrived at the waters of the Pacific. Captain Wilkes gives, in his narrative, a very interesting account of the condition and number of the native inhabitants of Oregon in Texas. He says—

"I satisfied myself that the accounts given of the depopulation of this country are not exaggerated; for places were pointed out to me where dwelt whole tribes that have been entirely swept off; and during the time of the greatest mortality, the shores of the river were strewed with the dead and dying. This disease, ague and fever, occurs, it is said, semi-annually, and in the case of foreigners it is more mild at each succeeding attack,

"Owing to the above causes, the population is much less than I expected to the lonely board. He scarce seemed to attract the notice of any one, but ate his meal in silence, and retired. During the time of his prosperity he was ever ready to search out and bring to punishment all those who committed depredations on strangers.

"Casenove's tribe is not the only one that has suffered in this way; many others have been swept off entirely by this fatal disease, without leaving a single survivor to tell their melancholy tale.

"The cause of this great mortality among the Indians, has been attributed to the manner in which the disease has been treated, or rather to the superstitious practices. Their medicine-men and women are no better than jugglers, and use no medicine except some deleterious roots; while, from the character of these Indians, and their (barbarous) treatment of an unsuccessful practitioner, the whites decline administering any medicines, for fear of revengeful consequences.

"Of their medicine-men they have a great dread, and even of their bones after death. Thus, a medicine-man was buried near this burying-ground about a year before our visit to the country, whose body the wolves dug up: no one could be found to bury his bones again, and they were still to be seen bleaching on the surface of the ground.

"It is no sinicure to be a medicine-man; and if they inspire dread in others they are made to feel it themselves, being frequently obliged to pay the forfeit of their own lives, if they are not successful in curing their patients. The chief of the Klackamus tribe told Mr. Drayton that some of his men had gone to kill a medicine-man, in consequence of the death of his wife. These men afterwards returned with a horse and some smaller presents from the medicine-man, which he had paid to save his life.

"This rule equally applies to the whites who prescribe for Indians, an instance of which appeared a short time before our arrival, when Mr. Black, a chief trader in one of the northern posts, was shot dead in his own room, by an Indian to whose parent (a chief) he had been charitable enough to give some medicine. The chief died soon after taking it, and Mr. Black paid the forfeit of his kindness with his life. The deed was done in a remarkably bold and daring manner. The Indian went to the fort and desired to see Mr. Black, saying he was sick and cold. He was allowed to enter, and Mr. Black had a fire made for him, without any suspicions of his intentions. On his turning his back, however, towards the Indian, he was instantly shot, and fell dead on his face, when the man made his escape from the fort before any suspicions were excited of his being the murderer.

"To Mr. Black the world is indebted for the greater part of the geographical knowledge which has been published of the country west of the Rocky Mountains; and he not only devoted much of his time to this subject, but also to the making of many collections in the other departments of natural history, as well as in geology and mineralogy."

Many of the Oregon Indians leave their tribes and go on long journeys. Mr. Spalding, a missionary, informed Captain Wilkes that the number of Oregon Indians whom he has ascertained to have visited the United States was surprising. He informed our gentlemen that he had letters to Boston in eighty-one days from the Dalles, by means of Indians and the American rendezvous; and, what was remarkable, the slowest part of the route was from St. Louis to Boston. The communication is still carried on by Indians, although it was generally supposed to be by the free trappers. He considers that these tribes, both men and women, are an industrious people.

find it. I made every exertion to obtain correct information, and believe that at the time of our visit, the following was very nearly the truth, viz. :—

Vancouver and Washington Island	5000
From latitude 50° to 54° north on the main	2000
Fenn's Cove, Whidby's Island, including the main land (Sachet tribe)	650
Hood's Canal (Suquamish and Toando tribes)	500
Birch Bay	300
Fraser's River	500
Clalams, at Port Discovery, New Dungeness	350
Port Townsend	70
Classet Tribe, Cape Flattery, and Point Grenville	1250
Nisqually	200
Chickeles and Puget Sound	700
Port Orchard	150
Cowlitz	330
Okonagan	300
Colville and Spokane	450
Kilamukes	400
Chinooks	209
Clatsops	220
Cascades	150
Pillar Rock, Oak Point, and Columbia River	300
Willamette Fall and Valley	275
Dalles	250
De Chute's and John Day's River	300
Yakima	100
Wallawalla	1100
Blackfeet, that dwell principally on the west side of the Rocky Mountains	1000
Umpquas	400
Rogues' River	500
Klamets	300
Shaste	500
Callapuyas	600
Total	19,354

“The whole territory may therefore be considered as containing about 20,000 Indians; and this, from a careful revision of the data obtained by myself and some of the officers, I am satisfied is rather above than under the truth. The whites and half-breds were between 700 and 800; 150 were Americans. The number of the latter has, however, increased very much since the year 1840, as many emigrants have crossed the mountains. The decrease of the red race is no doubt equivalent to the increase by immigration.”

CHAPTER XXVIII.

OVERLAND EXPEDITIONS FROM THE UNITED STATES TO OREGON AND CALIFORNIA.

IN order to continue our account of the progress of America, we must follow the advance of the European race over the wilderness countries, which extend between the Mississippi and the Pacific Ocean. The spirit of enterprise, and the love of adventure, have urged bold men to face the most perilous dangers,—to suffer the most miserable privations, and to endure the greatest fatigue, in traversing those vast regions, from the time, when Sir Alexander Mackenzie explored the breadth of America, between the rivers of Canada and the shores of the Pacific, until the period when the Rocky Mountains have been crossed by the most recent band of adventurers.

We shall hereafter sketch the routes from the Missouri, over the great central prairies to Santa Fé, and to the great Mexican plain of Anahuac. We have followed the United States exploring parties under Captain Wilkes, in North and South Oregon and California. To complete, or follow up, the explorations made in Oregon and California, two expeditions were fitted out, the first in 1843, the second in 1844: both under the command of Captain Fremont, of the United States Topographical Engineers.

The narrative, or journal of those expeditions, is remarkably well written, and abounds in the most interesting information relative to the climate, soil, geology, and natural history generally, of the countries traversed by Captain Fremont.

The object of the first expedition was to explore the regions between the Missouri River and the SOUTH PASS of the Rocky Mountains, and the territories also drained by the Kansas and Great Platte Rivers. He departed from the city of Washington on the 2nd of May, 1842, and arrived at St. Louis on the 22nd, from whence Captain Fremont and his party proceeded about 400 miles to Chouteau's trading place, ten miles above the mouth of the Kansas in latitude 39 deg. 6 min. north, longitude 94 deg. 26 min. west, 700 feet above the level of the sea. This exploring party consisted of Captain Fremont, as commander, Mr. Preuss, a German, as assistant surveyor, Maxwell a hunter, Carson, long noted as a bold trapper in the Rocky Mountains, two youths as adventurers, and about twenty men, habituated to prairie, mountain, river, and forest life,—chiefly Canadian voyageurs and half-breds, who had been brought up in the service of the fur companies: all were well armed and mounted on horses. They started with eight waggons, drawn by mules carrying the luggage,—some oxen, driven along to be killed for provisions, and a few spare horses.

"From the belt of wood," says Captain Fremont, "which borders the Kansas,

in which we had passed several good-looking Indian farms, we suddenly emerged on the prairies, which received us at the outset with some of their striking characteristics; for here and there rode an Indian, and but a few miles distant heavy clouds of smoke were rolling before the fire. In about ten miles we reached the Santa Fé road, along which we continued for a short time, and encamped early on a small stream; having travelled about eleven miles. During our journey, it was the customary practice to encamp an hour or two before sunset, when the carts were disposed so as to form a sort of barricade around a circle some eighty yards in diameter. The tents were pitched, and the horses hobbled and turned loose to graze; and but a few minutes elapsed before the cooks of the messes, of which there were four, were busily engaged in preparing the evening meal. At nightfall, the horses, mules, and oxen, were driven in and picketed—that is, secured by a halter, of which one end was tied to a small steel-shod picket, and driven into the ground; the halter being twenty or thirty feet long, which enabled them to obtain a little food during the night. When we had reached a part of the country where such a precaution became necessary, the carts being regularly arranged for defending the camp, guard was mounted at eight o'clock, consisting of three men, who were relieved every two hours; the morning watch being horse guard for the day. At daybreak, the camp was roused, the animals turned loose to graze, and breakfast generally over between six and seven o'clock, when we resumed our march, making regularly a halt at noon for one or two hours. Such was usually the order of the day, except when accident of country forced a variation; which, however, happened but rarely. We travelled next day along the Santa Fé road, which we left in the afternoon, and encamped late in the evening on a small creek called by the Indians Mishmagwi."

After a journey of extraordinary fatigue, attended frequently with severe privation, Captain Fremont arrived at the ascent to the southern pass of the Rocky Mountains. The narrative of this journey is remarkably interesting, The perils of fording and ascending rivers,—the hostility of the Indian tribes, the disturbed state of the country west of the American settlements,—the buffalo herds and hunts,*—the sufferings of the emigrants on their way to Oregon,—the lives of the trappers,†—the account of the trading-posts, the arrangements for

* See account of the Buffalo and Fur Trade in Supplement, and in vol. ii.

† THE TRAPPERS OR BEAVER HUNTERS.—"In the old times of the Canadian Fur trade, when the trade in furs was chiefly pursued about the lakes and rivers, the expeditions were, in a great degree, carried on in batteaux and canoes. But a totally different class has now sprung up—the "mountaineers"—the traders and trappers that scale the vast mountain chains, and pursue their hazardous vocation amidst their wild recesses—moving from place to place on horseback—exposed not alone to the perils of the wilderness, but to the perils of attack from fierce Indians, to whom it has become as favourable an exploit to harass and waylay a band of trappers with their pack-horses, as it is to the Arabs of the desert to plunder a caravan. The equestrian exercises in which they are constantly engaged—the nature of the country they traverse—vast plains and mountains pure and exhilarating in their atmospheric qualities—seem to make them, physically and mentally, a more lively, vigorous, daring, and enduring race than the fur traders and trappers of former days, who generally had huts or tents to shelter them

travelling, the exhausted state of their horses, the manner in which fresh horses and guides were procured, and the accounts of the regions travelled over, are clearly described.

On the 15th of July the party reached Fort Laramie. On the left bank of the river, about twenty-five feet above the water, Captain Fremont says, "Its lofty walls whitewashed and picketed, with large bastions at the angles, gave it an imposing appearance. A cluster of Sioux lodges was pitched under the walls, and with the background of the Black Hills, and the prominent peak of Laramie Mountain, strongly drawn in the clear light of the western sky, where the sun had already set, the whole formed at the moment a strikingly beautiful picture. Mr. Boudeau, in charge of the post, received us with great hospitality.

"Laramie, is a quadrangular structure, built of clay, after the fashion of the Mexicans, who are generally employed in building them. The walls are about fifteen feet high, surmounted with a wooden palisade, and form a portion of ranges of houses, which entirely surround a yard of about 130 feet square. Every apartment has its door and window—all opening on the inside. There are two entrances opposite each other, and midway the wall, one of which is a large and public entrance; the other smaller and more private—a sort of postern gate. Over the great entrance is a square tower with loop-holes, and, like the rest of the work, built of earth. At two of the angles, and diagonally opposite each other, are large square bastions so arranged as to sweep the four faces of the walls.

This post belongs to the American Fur Company, and intrusted to the care of two clerks and about sixteen men. "As usual, these had found wives among the Indian squaws: and with the usual accompaniment of children the place had a populous appearance." The object of the establishment is trade with the neighbouring tribes, who, in the course of the year, generally make two or three visits to the fort. In addition to this, traders, with a small outfit, are constantly kept

from the inclemency of the seasons—were seldom exposed to the hostility of the natives, and generally were within reach of supplies from the settlements. There is, perhaps, no class of men on the earth who lead a life of more continued exertion, danger, and excitement, and who are more enamoured of their occupations, than the free trappers of the wild regions of the West. No toil, no danger, no privation, can turn the trapper aside from his pursuit. If his meal is not ready in time, he takes his rifle—hies to the forest—shoots his game—lights his fire, and cooks his repast. With his horse and his rifle he is independent of the world, and spurns its restraints. In vain may the most vigilant and cruel savages beset his path—in vain may rocks, and precipices, and wintry torrents oppose his progress; let but a single track of a beaver meet his eye, and he forgets all danger, and defies all difficulties. At times he may be seen, with his traps on his shoulders, buffeting his way across rapid streams amidst floating blocks of ice; at other times, with his traps slung on his back, clambering the most rugged mountains—scaling or descending the most frightful precipices—searching by routes inaccessible to horse, and never before trodden by white man, for springs and lakes unknown to his comrades, where he may meet with his favourite game. This class of hunters are generally Canadians by birth, and of French descent; who, after being bound to serve the traders for a certain number of years and receive wages, or hunt on shares, then continue to hunt and trap on their own account, trading with the company like the Indians; hence they are called free men."—*Dunn's History of the Oregon Territory.*

amongst them. The articles of trade consist on the one side, almost entirely of buffalo robes; and, on the other, of blankets, calicoes, guns, powder, and lead, with such cheap ornaments as glass beads, looking-glasses, rings, vermilion for painting, tobacco, and principally, and in spite of the prohibition, of spirits, brought into the country in the form of alcohol, and diluted with water before sold. The American Fur Company, throughout the country, are strenuously opposed to the introduction of spirituous liquors. "But," says Captain Fremont, "when a keg of alcohol will purchase from an Indian every thing he possesses—his furs, his lodge, his horses, and even his wife and children—and when any vagabond, who has money enough to purchase a mule, can go into a village and trade against them successfully, without withdrawing entirely from the trade it is impossible for them to discontinue its use. In their opposition to this practice, the company is sustained, not only by their obligation to the laws of the country and the welfare of the Indians, but clearly also on grounds of policy; for, with heavy and expensive outfits, they contend at manifestly great disadvantage against the numerous independent and unlicensed traders, who enter the country from various avenues, from the United States and from Mexico, having no other stock in trade than some kegs of liquor, which they sell at the modest price of thirty-six dollars per gallon. The difference between the regular trader and the *coureur des bois* (as the French call the itinerant or peddling traders), with respect to the sale of spirits, is here, as it always has been, fixed and permanent, and growing out of the nature of their trade. The regular trader looks a-head, and has an interest in the preservation of the Indians, and in the regular pursuit of their business, and the preservation of their arms, horses, and every thing necessary to their future and permanent success in hunting: the *coureur des bois* has no permanent interest, and gets what he can, and for what he can, from every Indian he meets, even at the risk of disabling him from doing any thing more at hunting."*

The fort had a very cool and clean appearance. The great entrance was

* Captain Fremont learned the following particulars of the condition of the country. "For several years the Cheyennes and Sioux had gradually become more and more hostile to the whites, and in the latter part of August, 1841, had had rather a severe engagement with a party of sixty men under the command of Mr. Frapp, of St. Louis. The Indians lost eight or ten warriors, and the whites had their leader and four men killed. This fight took place on the waters of Snake River; and it was this party, on their return under Mr. Bridger, which had spread so much alarm among my people. In the course of the spring two other small parties had been cut off by the Sioux—one on their return from the Crow nation, and the other among the Black Hills." The emigrants to Oregon and Mr. Bridger's party met here a few days before Captain Fremont's arrival. "Divisions and misunderstandings had grown up among them; they were already somewhat disheartened by the fatigue of their long and wearisome journey, and the feet of their cattle had become so much worn as to be scarcely able to travel. In this situation they were not likely to find encouragement in the hostile attitude of the Indians, and the new and unexpected difficulties which sprang up before them. They were told that the country was entirely swept of grass, and that few or no buffalo were to be found on their line of route; and, with their weakened animals, it would be impossible for them to transport their heavy waggons over the mountains. Under these circumstances, they disposed of their waggons and cattle at the forts; selling them at the prices they had paid in the States, and taking in exchange coffee and sugar at *one dollar a pound*, and miserable worn-out horses, which died before they reached the mountains. The superintendent at Laramie purchased thirty, and at the lower fort eighty head of fine cattle, some of them of the Durham breed. Mr. Fitzpatrick, whose

floored, and about fifteen feet long, made a pleasant, shaded seat, through which the breeze swept constantly; for this country is famous for high winds. The Indian tribes were at this period in a state of hostility, and the routes to Oregon, California, and Mexico were rendered extremely dangerous.

"The effect of a recent engagement (with a Mr. Frapp) had been greatly to irritate the hostile spirit of the savages; and immediately subsequent to that event, the Gros Ventre Indians had united with the Oglallahs and Cheyennes, and taken the field in great force—to the amount of 800 lodges. Their object was to make an attack on a camp of Snake and Crow Indians, and a body of about 100 whites, who had made a rendezvous somewhere in the Green River Valley, or on the Sweet Water. After spending some time in buffalo hunting in the neighbourhood of the Medicine Bow Mountain, they were to cross over to the Green River Waters, and return to Laramie by way of the South Pass and the Sweet Water Valley." Captain Fremont subsequently learned that a party of emigrants, led by Mr. Fitzpatrick were overtaken by their pursuers near Rock Independence, in the valley of the Sweet Water; but that his skill and resolution saved them. From Fort Laramie to the Red Buttes, by the ordinary road is 135 miles; and, though only on the threshold of danger, the services of an interpreter were secured.

"So far as frequent interruption from the Indians would allow," says Captain Fremont, "we occupied ourselves in making some astronomical calculations, and bringing up the general map to this stage of our journey; but the tent was generally occupied by a succession of our unceremonious visitors. Some came for presents, and others for information of our object in coming to the country; now and then, one would dart up to the tent on horseback, jerk off his trappings, and stand silently at the door, holding his horse by the halter, signifying his desire to trade. Occasionally a savage would stalk in with an invitation to a feast of honour,—a dog feast, and deliberately sit down and wait quietly until I was ready to accompany him. I went to one; the women and children were sitting outside the lodge, and we took our seats on buffalo robes spread around. The dog was in a large pot over the fire, in the middle of the lodge, and immediately on our arrival was dished up in large wooden bowls, one of which was handed to each. The flesh appeared very glutinous, with something of the flavour and appearance of mutton.

"During the 18th of July, an expected Indian village arrived, consisting principally of old men, women, and children. They had a considerable number of horses, and large troops of dogs. Their lodges were pitched near the fort, and our camp was

name and high reputation are familiar to all who interest themselves in the history of this country, had reached Laramie in company with Mr. Bridger; and the emigrants were fortunate enough to obtain his services to guide them as far as the British post of Fort Hall, about 250 miles beyond the south pass of the mountains. They had started for this post on the 4th of July, and immediately after their departure, a war party of 350 *braves* set out upon their trail. As their principal chief or partisan had lost some relations in the recent fight, and had sworn to kill the first whites on his path, it was supposed that their intention was to attack the party, should a favourable opportunity offer; or if foiled in their principal object, content themselves with stealing horses and cutting off stragglers."

constantly crowded with Indians of all sizes, from morning until night; at which time some of the soldiers, generally, came to drive them all off to the village. My tent was the only place which they respected. Here only came the chiefs and men of distinction, and generally one of them remained to drive away the women and children. The numerous strange instruments, applied to still stranger uses, excited awe and admiration among them, and those which I used in talking with the sun and stars they looked upon with especial reverence, as mysterious things of "great medicine." Of the three barometers which I had brought with me thus far successfully, I found that two were out of order, and spent the greater part of the 19th in repairing them. We had the misfortune to break here a large thermometer, graduated to show fifths of a degree, which I used to ascertain the temperature of boiling water, and with which I had promised myself some interesting experiments in the mountains. We had but one remaining on which the graduation extended sufficiently high; and this was too small for exact observations. During our stay here, the men had been engaged in making numerous repairs, arranging pack-saddles, and otherwise preparing for the chances of a rough road and mountain travel. All things of this nature being ready, I gathered them round me in the evening, and told them that I had determined to proceed next day. They were all well armed. Our observations showed that the chronometer had preserved its rate in a most satisfactory manner. As deduced from it, the longitude of Fort Laramie is 7 hours 01 min. 21 sec., and from lunar distance 7 hours 01 min. 29 sec.; giving for the adopted longitude 104 deg. 47 min. 43 sec. The elevation of the fort above the Gulf of Mexico is 4470 feet. The winter climate here is remarkably mild for the latitude; but rainy weather is frequent, and the place is celebrated for winds, of which the prevailing one is west. An east wind in summer, and a south wind in winter, are said to be always accompanied with rain."

On being ready to depart on the 21st of July, the interpreter stated his apprehension of formidable dangers, and that the chiefs were assured they would all be cut off by hostile tribes; but Captain Fremont was not to be daunted, and he determined on prosecuting the journey. The road led over an interesting plateau between the north fork of the Platte on the right, and Laramie River on the left.

"Our tents," he observes, "having been found too thin to protect ourselves and the instruments from the rains, which in this elevated country are attended with cold and unpleasant weather, I had procured from the Indians at Laramie a tolerably large lodge, about eighteen feet in diameter, and twenty feet in height. Such a lodge, when properly pitched, is, from its conical form, almost perfectly secure against the violent winds which are frequent in this region, and, with a fire in the centre, is a dry and warm shelter in bad weather. By raising the lower part, so as to permit the breeze to pass freely, it is converted into a pleasant

summer residence, with the extraordinary advantage of being entirely free from mosquitoes, one of which I have never seen in an Indian lodge."

"To keep open the communications," says Captain Fremont, "with Oregon territory, a show of military force in this country is absolutely necessary; and a combination of advantages renders the neighbourhood of Fort Laramie the most suitable place, on the line of the Platte, for the establishment of a military post. It is connected with the mouth of the Platte and the Upper Missouri by excellent roads, which are in frequent use, and would not in any way interfere with the range of the buffalo, on which the neighbouring Indians mainly depend for support. It would render any posts on the Lower Platte unnecessary, the ordinary communication between it and the Missouri being sufficient to control the intermediate Indians. It would operate effectually to prevent any such coalitions as are now formed among the Gros Ventres, Sioux, Cheyennes, and other Indians, and would keep the Oregon road through the valley of the Sweet Water and the South Pass of the mountains constantly open. It lies at the foot of a broken and mountainous region, along which, by the establishment of small posts in the neighbourhood of St. Vrain's Fort, on the South Fork of the Platte, and Bent's Fort, on the Arkansas, a line of communication would be formed, by good *waggon* roads, with our southern military posts, which would entirely command the mountain passes, hold some of the most troublesome tribes in check, and protect and facilitate our intercourse with the neighbouring Spanish settlements. The valleys of the rivers on which they would be situated are fertile; the country, which supports immense herds of buffalo, is admirably adapted to grazing; and herds of cattle might be maintained by the posts, or obtained from the Spanish country, which already supplies a portion of their provisions to the trading posts mentioned above."—*Narrative*.

To the south, along the route on the 22nd, the main chain of the Black or Laramie Hills rises precipitously upward in masses along the summits. An inverted cone of black cloud (cumulus) rested during all the forenoon on the lofty peak of Laramie Mountain, estimated to be 6500 feet above the sea. Eastward of the meridian of Fort Laramie, the principal objects which strike the eye of a traveller are the absence of timber, and the immense expanse of prairie, covered with the verdure of rich grasses, and highly adapted for pasturage. Wherever they are not disturbed by man, large herds of buffalo give animation to this country. Westward of Laramie River, the region becomes sandy, and apparently sterile.

"The prominent characteristic is the extraordinary abundance of *artemisia*, which grows everywhere—on the hills, and over the river bottoms, in tough, twisted, wiry clumps; and, wherever the beaten track was left, they rendered the progress of the carts rough and slow. As the country increased in elevation on our advance to the west, they increased in size; and the whole air is strongly impregnated and saturated with the odour of camphor and spirits of turpentine, which are combined in this plant." "This climate," says Captain Fremont, "has been

found very favourable to the restoration of health, particularly in cases of consumption; and possibly the respiration of air so highly impregnated with aromatic plants may have some influence. The present year had been one of unparalleled drought, and throughout the country the water had been almost dried up. The greater number of the springs, and many of the streams, which made halting-places for the *voyageurs* had been dried up. Every where the soil looked parched and burnt; the scanty yellow grass crisped under the foot, and even the hardiest plants were destroyed by want of moisture. I think it necessary to mention this fact, because, to the rapid evaporation in such an elevated region, nearly 5000 feet above the sea, almost wholly unprotected by timber, should be attributed much of the sterile appearance of the country, in the destruction of vegetation, and the numerous saline efflorescences which covered the ground."

Before leaving the last crossing of the Platte, Captain Fremont says, "I will endeavour to give some description of the nature of the road from Laramie to this point. The nature of the soil may be inferred from its geological formation. The limestone at the eastern limit of this section is succeeded by limestone without fossils, a great variety of sandstone, consisting principally of red sandstone and fine conglomerates. The red sandstone is argillaceous, with compact white gypsum or alabaster, very beautiful. The other sandstones are grey, yellow, and ferruginous, sometimes very coarse. The apparent sterility of the country must, therefore, be sought for in other causes than the nature of the soil. The face of the country cannot, with propriety, be called hilly. It is a succession of long ridges, made by the numerous streams which come down from the neighbouring mountain range. The ridges have an undulating surface, with some such appearance as the ocean presents in an ordinary breeze.

"The road which is now generally followed through this region is therefore a very good one, without any difficult ascents to overcome. The principal obstructions are near the river, where the transient waters of heavy rains have made deep ravines with steep banks, which renders frequent circuits necessary. It will be remembered that waggons pass this road only once or twice a year, which is by no means sufficient to break down the stubborn roots of the innumerable artemisia bushes. A partial absence of these is often the only indication of the track; and the roughness produced by their roots in many places gives the road the character of one newly opened in a wooded country. This is usually considered the worst part of the road east of the mountains; and, as it passes through an open prairie region, may be much improved, so as to avoid the greater part of the inequalities it now presents.

"From the mouth of the Kansas to the Green River Valley, west of the Rocky Mountains, there is no such thing as a mountain road on the line of communication."

Before starting on the most difficult and perilous part of the journey, and which he was earnestly dissuaded, from the hostile state of the country, not to

attempt, Captain Fremont says, "Having resolved to disencumber ourselves immediately of every thing not absolutely necessary to our future operations, I turned directly in toward the river, and encamped on the left bank, a little above the place where our council had been held, and where a thick grove of willows offered a suitable spot for the object I had in view.

"The carts having been discharged the covers and wheels were taken off, and, with the frames, carried into some low places among the willows, and concealed in the dense foliage in such a manner that the glitter of the iron-work might not attract the observation of some straggling Indian. In the sand, which had been blown up into waves among the willows, a large hole was then dug, ten feet square and six deep. In the mean time all our effects had been spread out upon the ground, and whatever was designed to be carried along with us separated and laid aside, and the remaining part carried to the hole and carefully covered up. As much as possible all traces of our proceedings were obliterated, and it wanted but a rain to render our *cache* safe beyond discovery. All the men were now set at work to arrange the pack-saddles and make up the packs." The best thermometer was accidentally broken at this place, which was named *Cache* camp, longitude 106 deg. 38 min. 26 sec., latitude 42 deg. 50 min. 53 sec."

All the arrangements having been completed, the expedition left the encampment early on the morning of the 29th of July. In a few miles they reached the Red Buttes, a famous landmark, whose geological composition is red sandstone, limestone, and calcareous sandstone and pudding-stone. Here the river cuts its way through a ridge; on the eastern side of which are the lofty escarpments of red argillaceous sandstone, called the Red Buttes. On the banks were willow and cherry-trees. The cherries were not yet ripe, but in the thickets were numerous fresh tracks of the grizzly bear, which is very fond of this fruit.

Before leaving the course of the Platte, they saw numerous herds of mountain sheep, and frequently heard the rattling of stones rolling rapidly down the steep hills. This was the first place at which they had killed any of these sheep or goats (for they are called by each name). Their flesh is much esteemed by the hunters; and the horns are often three feet long and seventeen inches in circumference at the base, weighing eleven pounds. The use of these horns seems to be to protect the animal's head in pitching down precipices to avoid the wolves—their only safety being in places where they cannot be followed. "The bones are very strong and solid, the marrow occupying but a very small portion of the bone in the leg, about the thickness of a rye-straw. The hair is short, resembling the winter colour of our common deer, which it nearly approaches in size and appearance. Except in the horns, it has no resemblance whatever to the goat."

On leaving the course of the Platte, to cross over to the Sweet Water, they wound their way to the summit of the hills, of which the peaks are about 800 feet above the Platte, bare and rocky.

On the 1st of August, the hunters went a-head, as buffalo appeared tolerably abundant, and the party moved about seven miles up the valley, and encamped one mile below Rock Independence. This is an isolated granite rock, about 650 yards long, and forty in height. "Everywhere, within six or eight feet of the ground, where the surface is sufficiently smooth, and in some places sixty or eighty feet above, the rock is inscribed with the names of travellers. Many a name famous in the history of this country, and some well known to science, are to be found mixed among those of the traders and travellers for pleasure and curiosity, and of missionaries among the savages. Some of these have been washed away by the rain, but the greater number are still very legible. The position of this rock is in longitude 107 deg. 56 min., latitude 42 deg. 29 min. 36 sec. We remained at our camp of August 1st until noon of the next day, occupied in drying meat."

Five miles above Rock Independence they reached a place called the Devil's Gate, where the Sweet Water cuts through a granite ridge. "The length of the passage is about 300 yards, and the width thirty-five yards. The walls of rock are vertical, and about 400 feet in height; and the stream in the *gate* is almost entirely choked up by masses which have fallen from above. In the wall, on the right bank, is a dike of trap-rock, cutting through a fine-grained grey granite. Near the point of this ridge crop out some strata of the valley formation, consisting of a greyish micaceous sandstone, and fine-grained conglomerate and marl. The country for several miles up this valley, is exceedingly picturesque. On either side of the valley, which is four or five miles broad, the mountains rise to the height of 1200 and 1500 or 2000 feet. On the south side the range appears to be timbered, and during the night of the 3rd of August, was luminous with fires—probably the work of the Indians, who had just passed through the valley. On the north, broken and granite masses rise abruptly from the green sward of the river, terminating in a line of broken summits. Except in the crevices of the rock, and here and there on a ledge or bench of the mountain, where a few hardy pines have clustered together, these are perfectly bare and destitute of vegetation.

"Among these masses, where there are sometimes isolated hills and ridges, green valleys open in upon the river, which sweeps the base of these mountains for thirty-six miles. Everywhere its deep verdure and profusion of beautiful flowers is in pleasing contrast with the sterile grandeur of the rock and the barrenness of the sandy plain, which, from the right bank of the river, sweeps up to the mountain range that forms its southern boundary. The great evaporation on the sandy soil of this elevated plain, and the saline efflorescences which whiten the ground, and shine like lakes reflecting the sun, make a soil wholly unfit for cultivation." Travelling along the upland part of the valley, which is overgrown with *artemisia*, scattered about on the plain there were small isolated hills. One of these, about fifty feet high, consisted of white clay and marl, in nearly horizontal strata. Several bands of buffalo made their appearance on the 3rd, with herds of antelope; and a grizzly bear was seen scrambling up among the rocks. On

passing over a slight rise near the river, we caught the first view of the Wind River mountains, appearing, at this distance of about seventy miles, to be a low and dark mountainous ridge.

On the 9th of August, they approached the summits. Captain Fremont says, "The weather still cloudy, with occasional rain. Our general course was west, as I had determined to cross the dividing ridge by a bridle-path among the broken country more immediately at the foot of the mountains, and return by the waggon road, two and a half miles to the south of the point where the trail crosses.

"About six miles from our encampment brought us to the summit. The ascent had been so gradual, that we were obliged to watch very closely to find the place at which we had reached the culminating point. This was between two low hills, rising on either hand fifty or sixty feet. When I looked back at them, from the foot of the immediate slope on the western plain, their summits appeared to be about 120 feet above. From the impression on my mind at this time, and subsequently on our return, I should compare the elevation which we surmounted immediately at the pass, to the ascent of the Capitol hill from the avenue at Washington. It is difficult for me to fix positively the breadth of this pass. From the broken ground where it commences, at the foot of the Wind River chain, the view to the south-east is over a champaign country, broken, at the distance of nineteen miles, by the Table Rock; which, with the other isolated hills in its vicinity, seems to stand on a comparative plain. This I judged to be its termination, the ridge recovering its rugged character with the Table Rock. It will be seen that it in no manner resembles the places to which the term is commonly applied—nothing of the gorge-like character and winding ascents of the Alleghany passes in America; nothing of the Great St. Bernard and Simplon passes in Europe. Approaching it from the mouth of the Sweet Water, a sandy plain, 120 miles long, conducts by a gradual and regular ascent to the summit, about 7000 feet above the sea; and the traveller, without being reminded of any change by toilsome ascents, suddenly finds himself on the waters which flow to the Pacific Ocean. By the route we had travelled, the distance from Fort Laramie is 320 miles, or 950 from the mouth of the Kansas.

"Continuing our march, we reached, in eight miles from the Pass, the Little Sandy, one of the tributaries of the Colorado, or Green River of the Gulf of California. The weather had grown fine during the morning, and we remained here the rest of the day to dry our baggage and take some astronomical observations. The stream was about forty feet wide, and two or three deep, with clear water and a full swift current, over a sandy bed. It was timbered with a growth of low bushy and dense willows, among which were little verdant spots, which gave our animals fine grass, and where I found a number of interesting plants. Among the neighbouring hills I noticed fragments of granite containing magnetic iron. Longitude of the camp was 109 deg. 37 min. 59 sec., and latitude 42 deg. 27 min. 34 sec.

The face of the country traversed next day was of a brown sand of granite materials, the *detritus* of the neighbouring mountains. Strata of the milky quartz cropped out, and blocks of granite were scattered about, containing magnetic iron. In the afternoon we had a severe storm of hail, and encamped at sunset on the first New Fork. Within the space of a few miles, the Wind Mountains supply a number of tributaries to Green River, which are called the New Forks. Near our camp were two remarkable isolated hills, one of them sufficiently large to merit the name of mountain. They are called the Two Buttes, and will serve to identify the place of our encampment, which the observations of the evening placed in longitude 109 deg. 58 min. 11 sec., and latitude 42 deg. 42 min. 46 sec."

The air next morning, August the 10th, was clear and pure, and the morning extremely cold, but beautiful. "A lofty snow peak of the mountain is glittering in the first rays of the sun, which has not yet reached us. The long mountain wall to the east, rising 2000 feet abruptly from the plain, behind which we see the peaks, is still dark, and cuts clear against the glowing sky. A fog, just risen from the river, lies along the base of the mountain. A little before sunrise the thermometer was at 35 deg., and at sunrise 33 deg. Water froze last night, and fires are very comfortable. The scenery becomes hourly more interesting and grand, and the view here is truly magnificent; but, indeed, it needs something to repay the long prairie journey of 1000 miles. The sun has just shot above the wall, and makes a magical change. The whole valley is glowing and bright, all the mountain peaks are gleaming like silver. Though these snow mountains are not the Alps, they have their own character of grandeur and magnificence, and will doubtless find pens and pencils to do them justice. In the scene before us, we feel how much wood improves a view. The pines on the mountain seemed to give it much additional beauty. Instead of the creeks, which description had led me to expect, I find bold, broad streams, with three or four feet water, and a rapid current. The fork on which we are encamped is upwards of 100 feet wide, timbered with groves or thickets of the low willow. We were now approaching the loftiest part of the Wind River chain; and I left the valley a few miles from our encampment, intending to penetrate the mountains as far as possible with the whole party. We were soon involved in very broken ground, among long ridges covered with fragments of granite. Winding our way up a long ravine, we came unexpectedly in view of a most beautiful lake, set like a gem in the mountains. The sheet of water lay transversely across the direction we had been pursuing, and, descending the steep, rocky ridge, where it was necessary to lead our horses, we followed its banks to the southern extremity. Here a view of the utmost magnificence and grandeur burst upon our eyes. With nothing between us and their feet to lessen the effect of the whole height, a grand bed of snow-capped mountains rose before us, pile upon pile, glowing in the bright light of an August day. Immediately below them lay the lake, between two ridges, covered

with dark pines, which swept down from the main chain to the spot where we stood. Here, where the lake glittered in the open sunlight, its banks of yellow sand and the light foliage of aspen groves contrasted well with the gloomy pines. 'Never before,' said Mr. Preuss, 'in this country or in Europe, have I seen such magnificent grand rocks.' I was so much pleased with the beauty of the place, that I determined to make the main camp here, where our animals would find good pasturage, and explore the mountains with a small party of men. Proceeding a little further, we came suddenly upon the outlet of the lake, where it found its way through a narrow passage between low hills. Dark pines which overhung the stream, and masses of rock, where the water foamed along, gave it much romantic beauty. Where we crossed, which was immediately at the outlet, it is 250 feet wide, and so deep that with difficulty we were able to ford it. Its bed was an accumulation of rocks, boulders, and broad slabs, and large angular fragments, among which the animals fell repeatedly.

"The current was very swift, and the water cold, and of a crystal purity. In crossing this stream I met with a great misfortune in having my barometer broken. It was the only one. A great part of the interest of the journey for me was in the exploration of these mountains, of which so much had been said that was doubtful and contradictory; and now their snowy peaks rose majestically before me, and the only means of giving them authentically to science, the object of my anxious solicitude by night and day, was destroyed. We had brought this barometer in safety 1000 miles, and broke it almost among the snow of the mountains.

"The lake is about three miles long, and of very irregular width, and apparently great depth, and is the head water of the third New Fork, a tributary to *Green River*, the Colorado of the west, which flows into the Gulf of California. I encamped on the north side, about 350 yards from the outlet. This was the most western point at which I obtained astronomical observations, by which this place, called Bernier's encampment, is made in 110 deg. 08 min. 03 sec. west longitude from Greenwich, and latitude 43 deg. 49 min. 49 sec. We had no other compass than the small ones used in sketching the country; but from an azimuth, in which one of them was used, the variation of the compass is 18 deg. east.

"As soon as the camp was formed, I set about endeavouring to repair my barometer. The glass cistern had been broken about midway; but as the instrument had been kept in a proper position, no air had found its way into the tube, the end of which had always remained covered. Among the powder-horns in the camp, I found one which was very transparent, so that its contents could be almost as plainly seen as through glass. This I boiled and stretched on a piece of wood to the requisite diameter, and scraped it very thin, in order to increase

to the utmost its transparency. I then secured it firmly in its place on the instrument, with strong glue made from a buffalo, and filled it with mercury, properly heated. A piece of skin, which had covered one of the phials, furnished a good pocket, which was well secured with strong thread and glue, and then the brass cover was screwed to its place. The instrument was left some time to dry, and when I reversed it, a few hours after, I had the satisfaction to find it in perfect order; its indications being about the same as on the other side of the lake before it had been broken. Our success in this little incident diffused pleasure throughout the camp; and we immediately set about our preparations for ascending the mountains.

"As will be seen on reference to a map, on this short mountain chain are the head waters of four great rivers of the continent: namely, the Colorado, Columbia, flowing to the west; Missouri and Platte Rivers to the east.

"Our arrangements for the ascent were rapidly completed. We were in a hostile country, which rendered the greatest vigilance and circumspection necessary. The pass at the north end of the mountain was generally infested by Blackfeet; and immediately opposite was one of their forts, on the edge of a little thicket, 200 or 300 feet from our encampment. We were posted in a grove of beech, on the margin of the lake, and a few hundred feet long, with a narrow *prairillon* on the inner side, bordered by the rocky ridge. In the upper end of this grove we cleared a circular space about forty feet in diameter, and with the felled timber and interwoven branches, surrounded it with a breastwork five feet in height. A gap was left for a gate on the inner side, by which the animals were to be driven in and secured, while the men slept around the little work. It was half hidden by the foliage; and, garrisoned by twelve resolute men, would have set at defiance any band of savages which might chance to discover them in the interval of our absence. Fifteen of the best mules, with fourteen men, were selected for the mountain party. Our provisions consisted of dried meat for two days, with our little stock of coffee and some maccaroni. In addition to the barometer and a thermometer, I took with me a sextant and spy-glass, and our compasses.

"Early in the morning of August 12, we left the camp, fifteen in number, well armed, of course, and mounted on our best mules. A pack animal carried our provisions, with a coffee-pot and kettle, and three or four tin cups. Every man had a blanket strapped over his saddle, to serve for his bed, and the instruments were carried by turns on their backs. We entered directly on rough and rocky ground; and, just after crossing the ridge, had the good fortune to shoot an antelope. We heard the roar, and had a glimpse of a waterfall as we rode along; and, crossing in our way two fine streams, tributary to the Colorado, in about two hours' ride we reached the top of the first row or range of the mountains. Here, again, a view of the most romantic beauty met our

our eyes. It seemed as if, from the vast expanse of uninteresting prairies we had passed over, nature had collected all her beauties together in one chosen place. We were overlooking a deep valley, which was entirely occupied by three lakes, and from the brink the surrounding ridges rose precipitously 500 to 1000 feet, covered with the dark green of the balsam pine, relieved on the border of the lake with the light foliage of the aspen. They all communicated with each other; and the green of the waters, common to mountain lakes of great depth, showed that it would be impossible to cross them. The surprise manifested by our guides when these impassable obstacles suddenly barred our progress proved that they were among the hidden treasures of the place, unknown even to the wandering trappers of the region. Descending the hill, we proceeded to make our way along the margin to the southern extremity. A narrow strip of angular fragments of rock sometimes afforded a rough pathway for our mules, but generally we rode along the shelving side, occasionally scrambling up, at a considerable risk of tumbling back into the lake.

"The slope was frequently 60 deg.; the pines grew densely together; and the ground was covered with the branches and trunks of trees. The air was fragrant with the odour of the pines; and I realised this delightful morning the pleasure of breathing that mountain air which makes a constant theme of the hunter's praise, and which now made us feel as if we had all been drinking some exhilarating gas. The depths of this unexplored forest were a place to delight the heart of a botanist. There was a rich undergrowth of plants and numerous gay-coloured flowers in brilliant bloom. We at length reached the outlet where some freshly-barked willows that lay in the water showed that beaver had been recently at work. There were some small brown squirrels jumping about in the pines, and a couple of large mallard ducks swimming about in the stream.

"We resumed our journey after a halt of about an hour, making our way up the ridge on the western side of the lake.

"We had reached a very elevated point; and in the valley below, and among the hills, were a number of lakes at different levels; some 200 or 300 feet above others, with which they communicated by foaming torrents. Even to our great height, the roar of the cataracts came up, and we could see them leaping down in lines of snowy form. From this scene of busy waters, we turned abruptly into the stillness of a forest, where we rode among the open bolls of the pines, over a lawn of verdant grass, having strikingly the air of cultivated grounds. Towards evening, we reached a defile, or rather a hole in the mountains, entirely shut in by dark pine-covered rocks.

"A small stream, with a scarcely perceptible current, flowed through a level bottom of perhaps eighty yards width, where the grass was saturated with water. Into this the mules were turned, and were neither hobbled nor picketed during

the night, as the fine pasturage took away all temptation to stray ; and we made our bivouac in the pines.

“ Among all the strange places on which we had occasion to encamp during our long journey, none have left so vivid an impression on my mind as the camp of this evening. The disorder of the masses which surrounded us ; the little hole through which we saw the stars over head ; the dark pines where we slept ; and the rocks lit up with the glow of our fires, made a night-picture of very wild beauty.

The next morning was bright and pleasant, just cool enough to make exercise agreeable, and we soon entered the defile I had seen the preceding day. It was smoothly carpeted with a soft grass, and scattered over with groups of flowers, of which yellow was the predominant colour. Sometimes we were forced, by an occasional difficult pass, to pick our way on a narrow ledge along the side of the defile, and the mules were frequently on their knees ; but these obstructions were rare, and we journeyed on in the sweet morning air, delighted at our good fortune in having found such a beautiful entrance to the mountains. This road continued for about three miles, when we suddenly reached its termination in one of the grand views which, at every turn, meet the traveller in this magnificent region. Here the defile up which we had travelled, opened out into a small lawn, where, in a little lake, the stream had its source.

“ There were some fine *asters* in bloom, but all the flowering plants appeared to seek the shelter of the rocks, and to be of lower growth than below, as if they loved the warmth of the soil, and kept out of the way of the winds. Immediately at our feet a precipitous descent led to a confusion of defiles, and before us rose the mountains.

“ I determined to leave our animals here, and make the rest of our way on foot. The peak appeared so near, that there was no doubt of our returning before night ; and a few men were left in charge of the mules, with our provisions and blankets. We took with us nothing but our arms and instruments ; and, as the day had become warm, the greater part left our coats. Having made an early dinner, we started again. We were soon involved in the most ragged precipices, nearing the central chain very slowly, and rising but little. The first ridge hid a succession of others ; and when, with great fatigue and difficulty, we had climbed up 500 feet, it was but to make an equal descent on the other side ; all these intervening places were filled with small deep lakes, which met the eye in every direction, descending from one level to another, sometimes under bridges formed by huge fragments of granite, beneath which was heard the roar of the water. These constantly obstructed our path, forcing us to make long *détours* ; frequently obliged to retrace our steps, and frequently falling among the rocks. We clambered on, always expecting, with every ridge that we crossed, to reach the foot of the peaks, and always disappointed, until about four o'clock, when, pretty well

worn out, we reached the shore of a little lake, in which was a rocky island. By the time we had reached the further side of the lake, we found ourselves all exceedingly fatigued, and encamped. The spot we had chosen was a broad flat rock, in some measure protected from the winds by the surrounding crags, and the trunks of fallen pines afforded us bright fires. Near by was a foaming torrent, which tumbled into the little lake about 150 feet below us, and which, by way of distinction, we have called Island Lake. We had reached the upper limit of the piney region; as, above this point, no tree was to be seen, and patches of snow lay everywhere around us on the cold sides of the rocks. The flora of the region we had traversed since leaving our mules was extremely rich, and, among the characteristic plants, the scarlet flowers of the *dodecatheon dentatum* everywhere met the eye in great abundance. A small green ravine, on the edge of which we were encamped, was filled with a profusion of Alpine plants in brilliant bloom. From barometrical observations, made during our three days' sojourn at this place, its elevation above the Gulf of Mexico is 10,000 feet. During the day we had seen no sign of animal life; but among the rocks here, we heard what was supposed to be the bleat of a young goat, which we searched for with hungry activity, and found to proceed from a small animal of a grey colour, with short ears and no tail—probably the Siberian squirrel. We saw a considerable number of them, and, with the exception of a small bird like a sparrow, it is the only inhabitant of this elevated part of the mountains. On our return, we saw, below this lake, large flocks of the mountain goat. We had nothing to eat to-night. Lajeunesse, with several others, took their guns and sallied out in search of a goat; but returned unsuccessful. Here we had the misfortune to break our thermometer, having now only that attached to the barometer. I was taken ill shortly after we had encamped, and continued so until late in the night, with violent headach and vomiting. This was probably caused by the excessive fatigue I had undergone, and want of food, and perhaps, also, in some measure by the rarity of the air. The night was cold, as a violent gale from the north had sprung up at sunset, which entirely blew away the heat of the fires. The cold and our granite beds had not been favourable to sleep, and we were glad to see the face of the sun in the morning. Not being delayed by any preparation for breakfast, we set out immediately.

“On every side as we advanced was heard the roar of waters and of a torrent, which we followed up a short distance, until it expanded into a lake about one mile in length. On the northern side of the lake was a bank of ice, or rather of snow covered with a crust of ice. Carson had been our guide into the mountains, and, agreeably to his advice, we left this little valley, and took to the ridges again; which we found extremely broken, and where we were again involved among precipices. Here were ice-fields; among which we were all dispersed, each seeking the best path to ascend the peak. Mr. Preuss attempted to walk

along the upper edge of one of these fields, which sloped away at an angle of about twenty degrees; but his feet slipped from under him, and he went plunging down the plane. A few hundred feet below, at the bottom, were some fragments of sharp rock, on which he landed; and though he turned a couple of somersets, fortunately received no injury beyond a few bruises. Two of the men had been taken ill, and lay down on the rocks a short distance below; and at this point I was attacked with headach and giddiness, accompanied by vomiting, as on the day before. Finding myself unable to proceed, I sent the barometer over to Mr. Preuss, who was in a gap 200 or 300 yards distant, desiring him to reach the peak, if possible, and take an observation there. He found himself unable to proceed further in that direction, and took an observation, where the barometer stood at 19'401; attached thermometer 50 deg., in the gap. Carson, who had gone over to him, succeeded in reaching one of the snowy summits of the main ridge, whence he saw the peak, towards which all our efforts had been directed, towering 800 or 1000 feet into the air above him.

"We were now better acquainted with the topography of the country, and it became so unpleasantly cold, though the day was bright, that we set out on our return to the camp, at which we all arrived safely, straggling in one after the other. I continued ill during the afternoon, but became better towards sundown. They brought blankets and provisions, and we enjoyed well our dried meat and a cup of good coffee. We rolled ourselves up in our blankets, and, with our feet turned to a blazing fire, slept soundly until morning.

"When we had secured strength for the day by a hearty breakfast, we covered what remained, which was enough for one meal, with rocks, in order that it might be safe from any marauding bird; and, saddling our mules, turned our faces once more towards the peaks. Our mules had been refreshed by the fine grass in the little ravine at the island camp, and we intended to ride up the defile as far as possible, in order to husband our strength for the main ascent. Though this was a fine passage, still it was a defile of the most rugged mountains known, and we had many a rough and steep slippery place to cross before reaching the end. In this place the sun rarely shone; snow lay along the border of the small stream which flowed through it, and occasional icy passages made the footing of the mules very insecure, and the rocks and ground were moist with the trickling waters in this spring of mighty rivers. We soon had the satisfaction to find ourselves riding along the huge wall which forms the central summits of the chain. There at last it rose by our sides, a nearly perpendicular wall of granite, terminating 2000 to 3000 feet above our heads in a serrated line of broken jagged cones. We rode on until we came almost immediately below the main peak, which I denominated the Snow Peak, as it exhibited more snow to the eye than any of the neighbouring summits. Here were three small lakes of a green colour, each of, perhaps, a thousand yards in diameter, and apparently very deep. These lay

in a kind of chasm; and, according to the barometer, we had attained but a few hundred feet above the island lake. The barometer here stood at 20.450, attached thermometer 70 deg.

" We managed to get our mules up to a little bench about a hundred feet above the lakes, where there was a patch of good grass, and turned them loose to graze. During our rough ride to this place, they had exhibited a wonderful surefootedness. Parts of the defile were filled with angular, sharp fragments of rock, three or four and eight or ten feet cube; and among these they had worked their way, leaping from one narrow point to another, rarely making a false step, and giving us no occasion to dismount. Having divested ourselves of every unnecessary incumbrance, we commenced the ascent. This time, like experienced travellers, we did not press ourselves, but climbed leisurely, sitting down so soon as we found breath beginning to fail. At intervals we reached places where a number of springs gushed from the rocks, and about 1800 feet above the lakes came to the snow line. From this point our progress was uninterrupted climbing. Hitherto I had worn a pair of thick moccasins, with soles of *parflèche*; but here I put on a light thin pair, which I had brought for the purpose, as now the use of our toes became necessary to a further advance. I availed myself of a sort of comb of the mountain, which stood against the wall like a buttress, and which the wind and the solar radiation, joined to the steepness of the smooth rock, had kept almost entirely free from snow. Up this I made my way rapidly. Our cautious method of advancing in the outset had spared my strength; and, with the exception of a slight disposition to headach, I felt no remains of yesterday's illness. In a few minutes we reached a point where the buttress was overhanging, and there was no other way of surmounting the difficulty than by passing around one side of it, which was the face of a vertical precipice of several hundred feet.

Putting hands and feet in the crevices between the blocks, I succeeded in getting over it, and, when I reached the top, found my companions in a small valley below. Descending to them, we continued climbing, and in a short time reached the crest. I sprang upon the summit, and another step would have precipitated me into an immense snow-field 500 feet below. To the edge of this field was a sheer icy precipice; and then, with a gradual fall, the field sloped off for about a mile, until it struck the foot of another lower ridge. I stood on a narrow crest, about three feet in width, with an inclination of about 20 deg. north, 51 deg. east. As soon as I had gratified the first feelings of curiosity, I descended, and each man ascended in his turn; for I would only allow one at a time to mount the unstable and precarious slab, which it seemed a breath would hurl into the abyss below. We mounted the barometer in the snow of the summit, and fixing a ramrod in a crevice, unfurled the national flag to wave in the breeze where never flag waved before. During our morning's ascent, we had met no sign of animal

life, except the small sparrow-like bird already mentioned. A stillness the most profound, and a terrible solitude forced themselves constantly on the mind as the great features of the place. Here, on the summit, where the stillness was absolute, unbroken by any sound, and the solitude complete, we thought ourselves beyond the region of animated life; but while we were sitting on the rock, a solitary bee (*bromus*, the humble bee) came winging his flight from the eastern valley, and lit on the knee of one of the men.

"It was a strange place, the icy rock and the highest peak of the Rocky Mountains, for a lover of warm sunshine and flowers; and we pleased ourselves with the idea that he was the first of his species to cross the mountain barrier—a solitary pioneer to foretell the advance of civilisation. I believe that a moment's thought would have made us let him continue his way unharmed; but we carried out the law of this country, where all animated nature seems at war; and, seizing him immediately, put him in at least a fit place—in the leaves of a large book, among the flowers we had collected on our way. The barometer stood at 18.293, the attached thermometer at 44 deg.; giving for the elevation of this summit 13,570 feet above the Gulf of Mexico, which may be called the highest flight of the bee. It is certainly the highest known flight of that insect. From the description given by Mackenzie of the mountains where he crossed them, with that of a French officer still further to the north, and Colonel Long's measurements to the south, joined to the opinion of the oldest traders of the country, it is presumed that this is the highest peak of the Rocky Mountains. The day was sunny and bright, but a slight shining mist hung over the lower plains, which interfered with our view of the surrounding country. On one side we overlooked innumerable lakes and streams, the spring of the Colorado of the Gulf of California; and on the other was the Wind River valley, where were the heads of the Yellow-stone branch of the Missouri; far to the north, we could just discover the snowy heads of the *Trois Tetons*, where were the sources of the Missouri and Columbia Rivers; and at the southern extremity of the ridge, the peaks were plainly visible, among which were some of the springs of the Nebraska or Platte River. Around us, the whole scene had one main striking feature, which was that of terrible convulsion. Parallel to its length, the ridge was split into chasms and fissures; between which rose thin lofty walls, terminated with slender minarets and columns. According to the barometer, the little crest of the wall on which we stood was 3570 feet above that place, and 2780 above the little lakes at the bottom, immediately at our feet. Our camp at the Two Hills (an astronomical station) bore south 3 deg. east, which with a bearing afterwards obtained from a fixed position, enabled us to locate the peak. The bearing of the *Trois Tetons* was north 50 deg. west, and the direction of the central ridge of the Wind River Mountains south 39 deg. east. The summit rock was gneiss, succeeded by sienitic gneiss. Sienite and feldspar succeeded in our descent to

the snow line, where we found a feldspathic granite. I had remarked that the noise produced by the explosion of our pistols had the usual degree of loudness, but was not in the least prolonged, expiring almost instantaneously. Having now made what observations our means afforded, we proceeded to descend. We had accomplished an object of laudable ambition, and beyond the strict order of our instructions. We had climbed the loftiest peak of the Rocky Mountains, and looked down upon the snow a thousand feet below, and, standing where never human foot had stood before, felt the exultation of first explorers. It was about two o'clock when we left the summit; and when we reached the bottom, the sun had already sunk behind the wall, and the day was drawing to a close. It would have been pleasant to have lingered here and on the summit longer, but we hurried away as rapidly as the ground would permit, for it was an object to regain our party as soon as possible, not knowing what accident the next hour might bring forth.

"August 16.—We left our encampment with the daylight. We saw on our way large flocks of the mountain goat looking down on us from the cliffs. At the crack of a rifle, they would bound off among the rocks, and in a few minutes make their appearance on some lofty peak, some hundred or a thousand feet above. It is needless to attempt any further description of the country: the portion over which we travelled this morning was rough as imagination could picture it, and to us seemed equally beautiful. A concourse of lakes and rushing waters, mountains and rocks destitute of vegetable earth, dells and ravines of the most exquisite beauty, all kept green and fresh by the great moisture in the air, and sown with brilliant flowers, and everywhere thrown around all the glory of most magnificent scenes: these constitute the features of the place, and impress themselves vividly on the mind of the traveller.

"August 23.—Yesterday evening we reached our encampment at Rock Independence, where I took some astronomical observations. Here, not unmindful of the custom of early travellers and explorers in our country, I engraved on this rock of the Far West a symbol of the Christian faith. Among the thickly inscribed names, I made on the hard granite the impression of a large cross, which I covered with a black preparation of India-rubber, well calculated to resist the influence of wind and rain. It stands amidst the names of many who have long since found their way to the grave, and for whom the huge rock is a giant grave-stone.

"One George Weymouth was sent out to Maine by the Earl of Southampton, Lord Arundel, and others; and in the narrative of their discoveries, he says: 'The next day, we ascended in our pinnacle that part of the river which lies more to the westward, carrying with us a cross—a thing never omitted by any Christian traveller—which we erected at the ultimate end of our route.' This was in the year 1605; and in 1842 I obeyed the feeling of early travellers, and left the impression of the cross deeply engraved on the vast rock 1000 miles

beyond the Mississippi, to which discoverers have given the national name of *Rock Independence*."

In pursuance of instructions, Captain Fremont, to connect the explorations which he had conducted in 1842, with the surveys of Commander Wilkes on the coast of the Pacific Ocean, so as to give a connected survey of the interior of the American continent, proceeded to the Great West early in the spring of 1843, and arrived, on the 17th of May, at the little town of Kansas, on the Missouri frontier, near the junction of the Kansas River with the Missouri River. His party consisted principally of Creole and Canadian French, and Americans, amounting in all to thirty-nine men.

The party was armed generally with Hall's carbines, which, with a brass 12lb. howitzer, had been furnished from the United States arsenal at St. Louis. Three men were especially detailed for the management of this piece, under the charge of Louis Zindel, a native of Germany, who had been nineteen years a non-commissioned officer of artillery in the Prussian army. The camp equipage and provisions were transported in twelve carts, drawn each by two mules; and a light covered waggon, mounted on good springs, had been provided for the safer carriage of the instruments. These were—one refracting telescope, one reflecting circle, two sextants, two pocket chronometers, one syphon barometer, one cistern barometer, six thermometers, and a number of small compasses.

To make the exploration as useful as possible, he, in conformity to general instructions, varied the route to the Rocky Mountains from that followed in the year 1842; and, instead of traversing the valley of the Great Plate River to the South Pass, in north latitude 42 deg., to proceed up the valley of the Kansas River, to the head of the Arkansas, and to some pass in the Rocky Mountains, if any could be found, near the sources of that river.

The object of this deviation from the former route, was to open a new road to Oregon and California, in a climate more genial, and to obtain a better knowledge of an important river, and the country it drained; while the great object of the expedition would find its point of commencement at the termination of the former, which was at that great gate in the ridge of the Rocky Mountains called the South Pass, and on the lofty peak of the mountain which overlooks it, deemed the highest peak in the ridge, and from the opposite sides of which four great rivers take their rise, and flow to the Pacific or to the Mississippi.

After a tedious fatiguing journey, with jaded horses, the expedition halted on the 9th of August, in latitude, by observation, 42 deg. 20 min. 06 sec., immediately at the foot of the southern side of the range which walls in the Sweet Water Valley, at the head of a small tributary to that river.

They encamped on the banks of the Sweet Water River, about twenty miles above the Devil's Gate, in longitude 107 deg. 50 min. 07 sec.; elevation above

the sea 6040 feet ; and distance from St. Vrain's Fort, by the road we had just travelled, 315 miles.

Here passes the route to Oregon ; and the broad smooth highway, where the numerous heavy waggons of the emigrants had beaten and crushed the artemisia.

On the morning of the 13th, they left their encampment on the waters which flow towards the rising sun, and travelled along the upland, towards the dividing ridge which separates the Atlantic from the Pacific waters, and crossed it by a road some miles further south than the route followed on their return in 1842. "We crossed," says Captain Fremont, "very near the table mountain, at the southern extremity of the South Pass, which is near twenty miles in width, and already traversed by several different roads. Selecting, as well as I could, in the scarcely distinguishable ascent, what might be considered the dividing ridge in this remarkable depression in the mountain, I took a barometrical observation, which gave 7490 feet for the elevation above the Gulf of Mexico (in the report of 1842, I estimated the elevation of this pass at about 7000 feet). Its importance, as the great gate through which commerce and travelling may hereafter pass between the valley of the Mississippi and the North Pacific, justifies a precise notice of its locality and distance from leading points, in addition to this statement of its elevation. As stated in the report of 1842, its latitude at the point where we crossed is 42 deg. 24 min. 32 sec ; its longitude 109 deg. 26 min. its distance from the mouth of the Kansas, by the common travelling route, 962 miles ; from the mouth of the Great Platte, along the valley of that river, according to our survey of 1842, 882 miles ; and the distance from St. Louis about 400 miles more by the Kansas, and about 700 by the Great Platte route ; these additions being steamboat conveyance in both instances. From this pass to the mouth of the Oregon is about 1400 miles by the common travelling route ; so that, under a general point of view, it may be assumed to be about half way between the Mississippi and the Pacific Ocean, on the common travelling route. Following a hollow of slight and easy descent, in which was very soon formed a little tributary to the Gulf of California (for the waters which flow west from the South Pass go to this gulf), we made our usual halt four miles from the pass, in latitude, by observation, 42 deg. 19 min. 53 sec. Entering here the valley of Green River—the great Colorado of the West—and inclining very much to the southward along the streams which form the Sandy River, the road led for several days over dry and level uninteresting plains, to which a low, scrubby growth of artemisia gave a uniform dull grayish colour ; and on the evening of the 15th we encamped in the Mexican territory, on the left bank of Green River, sixty-nine miles from the South Pass, in longitude 110 deg. 05 min. 05 sec., and latitude 41 deg. 53 min. 54 sec., distant 1031 miles from the mouth of the Kansas. This is the emigrant road to Oregon, which bears much to the southward, to

avoid the mountains about the western heads of Green River—the *Rio Verde* of the Spaniards.

“August 16.—Crossing the river, here about 400 feet wide, by a very good ford, we continued to descend for seven or eight miles on a pleasant road along the right bank of the stream, of which the islands and shores are handsomely timbered with cotton-wood. The refreshing appearance of the broad river, with its timbered shores and green wooded islands, in contrast to its dry sandy plains, probably obtained for it the name of Green River, which was bestowed on it by the Spaniards who first came into this country to trade some twenty-five years ago. It was then familiarly known as the Seeds-ke-dée-agie, or Prairie Hen (*tetrao urophasianus*) River; a name which it received from the Crows, to whom its upper waters belong, and on which this bird is still very abundant. By the Shoshonee and Utah Indians, to whom belongs, for a considerable distance below, the country where we were now travelling, it was called the Bitter Root River, from the great abundance in its valley of a plant which affords them one of their favourite roots. Lower down, from Brown’s Hole to the southward, the river runs through lofty chasms, walled in by precipices of red rock; and even among the wilder tribes who inhabit that portion of its course, I have heard it called by Indian refugees from the Californian settlement the *Rio Colorado*. We halted at noon at the upper end of a large bottom near some old houses, which had been a trading post, in latitude 41 deg. 46 min. 54 sec. At this place the elevation of the river above the sea is 6230 feet. That of Lewis’s Fork of the Columbia at Fort Hall is, according to our subsequent observations, 4500 feet. The descent of each stream is rapid, but that of the Colorado is but little known, and that little derived from vague report. Three hundred miles of its lower part, as it approaches the Gulf of California, is reported to be smooth and tranquil; but its upper part is manifestly broken into many falls and rapids. From many descriptions of trappers, it is probable that in its foaming course among its lofty precipices it presents many scenes of wild grandeur; and though offering many temptations, and often discussed, no trappers have been found bold enough to undertake a voyage which has so certain a prospect of a fatal termination. The Indians have strange stories of beautiful valleys abounding with beaver, shut up among inaccessible walls of rocks in the lower course of the river; and to which the neighbouring Indians, in their occasional wars with the Spaniards and among themselves, drive their herds of cattle and flocks of sheep, leaving them to pasture in perfect security.

“In the afternoon we resumed our westerly course, passing over a somewhat high and broken country; and about sunset, after a day’s travel of twenty-six miles, reached Black’s Fork of the Green River. The heavy waggons have so completely pulverised the soil, that clouds of the same light dust are raised by the slightest wind, making the road sometimes very disagreeable.

"August 18.—We passed on the road, this morning, the grave of one of the emigrants, being the second we had seen since falling into their trail; and halted till noon on the river, a short distance above.

"One of our mules died here, and in this portion of our journey we lost six or seven of our animals. The grass which the country had lately afforded was very poor and insufficient; and animals which have been accustomed to grain become soon weak and unable to labour, when reduced to no other nourishment than grass.

"In the river hills at this place, I discovered strata of fossiliferous rock, having an *oolitic structure*, which, in connexion with the neighbouring strata, authorise us to believe that here, on the west side of the Rocky Mountains, we find repeated the modern formations of Great Britain and Europe, which have hitherto been wanting to complete the system of North American geology.

"I discovered, among alternating beds of coal and clay, a stratum of white indurated clay, containing very clear and beautiful impressions of vegetable remains.

"Coal made its appearance occasionally in the hills. *Artemisia* was characteristic among the few plants.

"August 20.—Gradually ascending, we reached the lower level of a bed of white limestone, lying upon a white clay, on the upper line of which the whole road is abundantly supplied with beautiful cool springs, gushing out a foot in breadth and several inches deep, directly from the hill side. At noon we halted at the last main fork of the creek, at an elevation of 7200 feet, and in latitude, by observation, 41 deg. 39 min. 45 sec.; and in the afternoon continued on the same excellent road, up the left or northern fork of the stream, towards its head, in a pass which the barometer placed at 8230 feet above the sea. This is a connecting ridge between the Utah, or Bear River Mountains, and the Wind River chain of the Rocky Mountains, separating the waters of the Gulf of California on the east, and those on the west belonging more directly to the Pacific, from a vast interior basin whose rivers are collected into numerous lakes having no outlet to the ocean. From the summit of this pass, the highest which the road crosses between the Mississippi and the Western Ocean, our view was over a very mountainous region, whose rugged appearance was greatly increased by the smoky weather, through which the broken ridges were dark and dimly seen. The ascent to the summit of the gap was occasionally steeper than the *national road* in the Alleghanys; and the descent, by way of a spur on the western side, is rather precipitous, but the pass may still be called a good one. Some thickets of willow in the hollows below deceived us into the expectation of finding a camp at our usual hour at the foot of the mountain; but we found them without water, and continued down a ravine, and encamped about dark at a place where the springs again began to make their appearance, but where our

animals fared badly; the stock of the emigrants having razed the grass as completely as if we were again in the midst of the buffalo.

"August 21.—An hour's travel this morning brought us into the fertile and picturesque valley of Bear River, the principal tributary to the Great Salt Lake. The stream is here 200 feet wide, fringed with willows and occasional groups of hawthorns. We were now entering a region which for us possessed a strange and extraordinary interest. We were upon the waters of the famous lake which forms a salient point among the remarkable geographical features of the country, and around which the vague and superstitious accounts of the trappers had thrown obscurity.

"We continued our road down the river, and at night encamped with a family of emigrants—two men, women, and several children—who appeared to be bringing up the rear of the great caravan. I was struck with the fine appearance of their cattle, some six or eight yoke of oxen, which really looked as well as if they had been all the summer at work on some good farm. It was strange to see one small family travelling along through such a country, so remote from civilisation. Some nine years since, such a security might have been a fatal one; but since their disastrous defeats in the country a little north, the Blackfeet have ceased to visit these waters. Indians, however, are very uncertain in their localities; and the friendly feelings, also, of those now inhabiting it may be changed."

According to barometrical observation, the elevation of the valley was 6400 feet above the sea, the encampment at night in latitude 42 deg. 03 min. 47 sec., and longitude 111 deg. 10 min. 53 sec., within the territorial limit of the United States; the route from entering the valley of the Green River, on the 15th of August, was to the south of the 42nd deg. of north latitude, and consequently on Mexican territory; by this route emigrants now travel to Oregon.

Antelope and elk were seen during the day on the opposite prairie; and ducks and geese on the river. Halted on the 22nd, in a fertile bottom, where the common blue flax was growing abundantly, and then the edge of the wood for several miles along the river was dotted with the white covers of emigrant waggons, collected in groups at different camps, where the smokes were rising lazily from the fires, around which the women were occupied in preparing the evening meal, and the children playing in the grass; and herds of cattle, grazing about in the bottom, had an air of quiet security and civilised comfort that made a rare sight for the traveller in such a remote wilderness. They had been reposing for several days in this delightful valley, in order to recruit their animals on its luxuriant pasturage, after their long journey, and prepare them for the hard travel along the comparatively sterile banks of the Upper Columbia. At the lower end of this extensive bottom the river passes through an open *canon*, where there were high vertical rocks to the water's edge, and the road here turns up a broad valley to the right.

"The road, next morning, presented an animated appearance. We found that

we had encamped near a large party of emigrants, and a few miles below another party was already in motion.

“ We had approached within something more than a mile of the village, when suddenly a single horseman emerged from it at full speed, followed by another, and another, in rapid succession; and then party after party poured into the plain, until, when the foremost rider reached us, all the whole intervening plain was occupied by a mass of horsemen, which came charging down upon us with guns and naked swords, lances, and bows and arrows—Indians entirely naked, and warriors fully dressed for war, with the long red streamers of their war bonnets reaching nearly to the ground, all mingled together in the bravery of savage warfare. They had been thrown into a sudden tumult by the appearance of our flag, which, among these people, is regarded as an emblem of hostility, it being usually borne by the Sioux, and the neighbouring mountain Indians, when they come here to war: and we had, accordingly, been mistaken for a body of their enemies. A few words from the chief quieted the excitement, and the whole band, increasing every moment in number, escorted us to their encampment, where the chief pointed out a place for us to encamp, near his own lodge, and made known our purpose in visiting the village. In a very short time we purchased eight horses, for which we gave in exchange blankets, red and blue cloth, beads, knives, and tobacco, and the usual other articles of Indian traffic. We obtained from them also a considerable quantity of berries of different kinds, among which service-berries were the most abundant; and several kinds of roots and seeds, which we could eat with pleasure, as any kind of vegetable food was gratifying to us. I ate here, for the first time, the *kooyah*, or *tobacco-root* (*valeriana edulis*), the principal edible root among the Indians who inhabit the upper waters of the streams on the western side of the mountains. It has a very strong and remarkably peculiar taste and odour, which I can compare to no other vegetable that I am acquainted with, and which to some persons is extremely offensive. It was characterised by Mr. Preuss as the most horrid food he had ever put in his mouth. To others, however, the taste is rather an agreeable one; and I was afterwards always glad when it formed an addition to our scanty meals. It is full of nutriment, and in its unprepared state is said to have very strong poisonous qualities, of which it is deprived by a peculiar process, being baked in the ground for about two days.

“ On the 24th, encamping in latitude (by observation) 42 deg. 36 min. 56 sec., chronometric longitude 111 deg. 42 min. 05 sec.

“ In our neighbourhood the mountains appeared extremely rugged, giving still greater value to this beautiful natural pass.

“ August 25.—Six miles' travel from our encampment, we reached one of the points in our journey to which we had always looked forward with great interest—the famous *Beer Springs*.

“ A pretty little stream of clear water enters the upper part of the basin from an

open valley in the mountains, and, passing through the bottom, discharges into Bear River. Crossing this stream, we descended a mile below, and made our encampment in a grove of cedar immediately at the Beer Springs, which, on account of the effervescing gas and acid taste, have received their name from the voyageurs and trappers of the country, who, in the midst of their rude and hard lives, are fond of finding some fancied resemblance to the luxuries they rarely have the fortune to enjoy."

|| The temperature of the largest of the *Beer Springs* was 65 deg. at sunset, that of the air being 62 deg. °5. The barometric observation gave 5,840 feet for the elevation above the gulf, being about 500 feet lower than the Boiling Springs at the foot of Pike's Peak. The astronomical observations gave for latitude 42 deg. 39 min. 57 sec., and 111 deg. 46 min. for longitude.

The temperature at sunrise 28 deg. °5. At the same time the temperature of the large Beer Spring, was 56 deg., that of the Steamboat Spring 87 deg., and that of the steam-hole near it, 81 deg. °5.

Next day he examined an extinct volcano. The country broken and tolerably well watered; frequently crossed ravines. Weather frequently hot and cloudy among the hilly country, with thunder-storms.

They soon after, August the 29th, entered the country of the *Diggers*.

"Scattered over the great region west of the Rocky Mountains, and south of the Great Snake River, are numerous Indians whose subsistence is almost wholly derived from roots and seeds, and such small animals as chance and great good fortune sometimes bring within their reach. They are miserably poor, armed only with bows and arrows, or clubs; and as the country they inhabit is almost destitute of game, they have no means of obtaining better arms. In the northern part of the region just mentioned, they live generally in solitary families; and further to the south they are gathered together in villages. Those who live together in villages, strengthened by association, are in exclusive possession of the more genial and richer parts of the country, while the others are driven to the ruder mountains, and to the more inhospitable parts of the country.

"Roots, seeds, and grass, every vegetable that affords any nourishment, and every living animal, thing, insect, or worm, they eat. Nearly approaching to the lower animal creation, their sole employment is to obtain food; and they are constantly occupied in a struggle to support existence."

Prairie hens, or grouse (*bonasia umbellus*), became abundant. Buffalo were seldom seen, and antelope rarely.

"September 1.—Travelling between Roseaux and Bear Rivers, we continued to descend the valley, which gradually expanded, as we advanced, into a level plain of good soil, about twenty-five miles in breadth, between mountains 3000 and 4000 feet high, rising suddenly to the clouds, which all day rested upon the peaks. Descending to the bottoms of Bear River, we found good grass for the animals, and encamped 300 yards above the mouth of Roseaux, which here

makes its junction, without communicating any of its salty taste to the main stream, of which the water remains perfectly pure.

An India-rubber boat, eighteen feet long, made somewhat in the form of a bark canoe of the northern lakes, constituted part of the outfit. The sides were formed by two air-tight cylinders, eighteen inches in diameter, connected with others forming the bow and stern. These were divided into four different compartments, and the interior space was sufficiently large to contain five or six persons, and a considerable weight of baggage. The Roseaux being too deep to be forded, this boat was filled with air, and in about one hour all the equipage of the camp, carriage and gun included, was carried across the river, which was from 60 to 100 yards broad, and the water so deep, that even on the shallowest points there were more than fifteen feet depth of water. On either side were alternately low bottoms and willow points, with an occasional high prairie; and for five or six hours the party in the boat descended slowly the winding course of the river, which crept along with a sluggish current among frequent *détours* several miles around. When endeavouring to get a shot at strange, large, shy birds, that were numerous among the willows, they came unexpectedly upon several families of *Root Diggers*, who were encamped among the rushes on the shore, and appeared very busy about several weirs or nets which had been rudely made of canes and rushes for the purpose of catching fish. They had the usual very large heads, remarkable among the Digger tribe, with matted hair, and were almost entirely naked; looking very poor and miserable, as if their lives had been spent amidst the rushes, beyond which they seemed to have very little knowledge.

The boat moved so heavily, that they landed near a high prairie bank, hauled up the boat, and *cached* their effects among the willows.

The high arable plain on which they had been travelling for several days past, terminated in extensive low flats, generally occupied by salt marshes, or beds of shallow lakes. The water had in most places evaporated, leaving the hard surface encrusted with a shining white residuum, and covered with small univalve shells. As they advanced, the whole country assumed this appearance; and there was no other vegetation than the shrubby chenopodiaceous and other apparently saline plants, on the rising grounds.

Basil was sent back next day with several men and horses for the boat, which in a direct course across the flats, was not ten miles distant. A pelican (*pelecanus onocrotalus*) was killed as he passed by, and many geese and ducks flew over the camp.

"On the plain were blackbirds and grouse. About seven miles from Clear Creek, at the foot of a mountain, there rushed with considerable force ten or twelve hot springs, highly impregnated with salt. In one of these the thermometer stood at 136 deg., and in another at 132 deg. '5; and the water, which flowed over the low ground, was coloured red.

They encamped on the 5th of September on the banks of a large and comparatively well-timbered stream call Weber's Fork, which was 100 to 150 feet wide, with high banks. Its water was clear and pure, without the slightest indication of salt.

Leaving the encampment early next day, they directed their course for the peninsular *butte*. They ascended to the summit. "Immediately at our feet," says Captain Fremont, "we beheld the object of our anxious search—the waters of the Inland Sea, stretching in still and solitary grandeur far beyond the limit of our vision. It was one of the great points of the exploration; and as we looked eagerly over the lake in the first emotions of excited pleasure, I am doubtful if the followers of Balboa felt more enthusiasm when, from the heights of the Andes, they saw for the first time the great western ocean. It was certainly a magnificent object, and a noble *terminus* to this part of our expedition; and to travellers so long shut up among mountain ranges, a sudden view over the expanse of silent waters had in it something sublime. Several large islands raised their high rocky heads out of the waves; but whether or not they were timbered was still left to our imagination, as the distance was too great to determine if the dark hues upon them were woodland or naked rock. During the day the clouds had been gathering black over the mountains to the westward, and, while we were looking, a storm burst down with sudden fury upon the lake, and entirely hid the islands from our view. So far as we could see along the shores there was not a solitary tree, and but little appearance of grass; and on Weber's Fork, a few miles below our last encampment, the timber was gathered into groves, and then disappeared entirely. As this appeared to be the nearest point to the lake where a suitable camp could be found, we directed our course to one of the groves, where we found a handsome encampment, with good grass and an abundance of rushes (*equisetum hyemale*). At sunset, the thermometer was at 55 deg.; the evening clear and calm, with some cumuli.

"September 7.—The morning was calm and clear, with a temperature at sunrise of 39 deg. '5. On the edge of the stream a favourable spot was selected in a grove, and, felling the timber, we made a strong *corral*, or horse-pen, for the animals, and a little fort for the people who were to remain. The India-rubber boat was repaired with cloth and gum, and filled with air, in readiness for the next day. The bottoms along the river were timbered with several kinds of willow, hawthorn, and fine cotton-wood trees (*populus Canadensis*), with remarkably large leaves, and sixty feet in height by measurement."

Captain Fremont, with Mr. Preuss, and three of his most intrepid men, Carson, Bernier, and Lajeunesse, prepared for the boat expedition on the lake—the first ever attempted on this interior sea; he says:

"We were favoured with most delightful weather. To-night there was a brilliant sunset of golden orange and green, which left the western sky clear and

beautifully pure ; but clouds in the east made me lose an occultation. The summer frogs were singing around us, and the evening was very pleasant, with a temperature of 60 deg.—a night of a more southern autumn. For our supper we had *yampah*, the most agreeably flavoured of the roots, seasoned by a small fat duck. Around our fire to-night were many speculations on what to-morrow would bring forth ; and in our busy conjectures we fancied that we should find every one of the large islands a tangled wilderness of trees and shrubbery, teeming with game of every description that the neighbouring region afforded, and which the foot of a white man or Indian had never violated. Frequently, during the day, clouds had rested on the summits of their lofty mountains, and we believed that we should find clear streams and springs of fresh water ; and we indulged in anticipations of the luxurious repasts with which we were to indemnify ourselves for past privations. Neither, in our discussions, were the whirlpool and other mysterious dangers forgotten, which Indian and hunters' stories attributed to this unexplored lake. Instead of being strongly sewed (like that of the preceding year, which had so triumphantly rode the canons of the Upper Great Platte), the present boat was only pasted together in a very insecure manner, the maker having been allowed so little time in the construction.

“ In view of our present enterprise, a part of the equipment of the boat had been made to consist in three air-tight bags, about three feet long, and capable each of containing five gallons. These had been filled with water the night before, and were now placed in the boat, with our blankets and instruments, consisting of a sextant, telescope, spy-glass, thermometer, and barometer.

“ We left the camp on the 8th of September, at sunrise, and had a very pleasant voyage down the river, in which there was generally eight or ten feet of water, deepening as we neared the mouth in the latter part of the day. In the course of the morning we discovered that two of the cylinders leaked so much as to require one man constantly at the bellows, to keep them sufficiently full of air to support the boat. Although we had made a very early start, we loitered so much on the way—stopping every now and then, and floating silently along to get a shot at a goose or a duck—that it was late in the day when we reached the outlet. The river here divided into several branches, filled with fluvials, and so very shallow that it was with difficulty we could get the boat along, being obliged to get out and wade. We encamped on a low point among rushes and young willows, where there was a quantity of drift wood, which served for our fires. The evening was mild and clear ; we made a pleasant bed of the young willows ; and geese and ducks enough had been killed for an abundant supper at night, and for breakfast the next morning. The stillness of the night was enlivened by millions of water-fowl. Latitude (by observation) 41 deg. 11 min. 26 sec. ; and longitude 112 deg. 11 min. 30 sec.

“ *September 9.*—The day was clear and calm ; the thermometer at sunrise at

49 deg. The channel in a short distance became so shallow that our navigation was at an end, being merely a sheet of soft mud, with a few inches of water, and sometimes none at all, forming the low-water shore of the lake. All this place was absolutely covered with flocks of screaming plover. We took off our clothes, and, getting overboard, commenced dragging the boat—making, by this operation, a very curious trail, and a very disagreeable smell in stirring up the mud, as we sank above the knee at every step. The water here was still fresh, with only an insipid and disagreeable taste, probably derived from the bed of fœtid mud. After proceeding in this way about a mile, we came to a small black ridge on the bottom, beyond which the water became suddenly salt, beginning gradually to deepen, and the bottom was sandy and firm. It was a remarkable division, separating the fresh waters of the rivers from the briny water of the lake, which was entirely *saturated* with common salt. Pushing our little vessel across the narrow boundary, we sprang on board, and at length were afloat on the waters of the unknown sea.

“ We did not steer for the mountainous islands, but directed our course towards a lower one, which it had been decided we should first visit, the summit of which was formed like the crater at the upper end of Bear River Valley. So long as we could touch the bottom with our paddles, we were very gay ; but gradually, as the water deepened we became more still in our frail bateau of gum cloth distended with air, and with pasted seams. Although the day was very calm, there was a considerable swell on the lake ; and there were white patches of foam on the surface, which were slowly moving to the southward, indicating the set of a current in that direction, and recalling the recollection of the whirlpool stories. The water continued to deepen as we advanced ; the lake becoming almost transparently clear, of an extremely beautiful bright green colour ; and the spray which was thrown into the boat and over our clothes, was directly converted into a crust of common salt, which covered also our hands and arms.

“ The form of the boat seemed to be an admirable one, and it rode on the waves like a water-bird ; but, at the same time, it was extremely slow in its progress. When we were a little more than half way across the reach, two of the divisions between the cylinders gave way, and it required the constant use of the bellows to keep in a sufficient quantity of air. For a long time we scarcely seemed to approach our island, but gradually we worked across the rougher sea of the open channel into the smoother water under the lee of the island ; and began to discover that what we took for a long row of pelicans, ranged on the beach, were only low cliffs whitened with salt by the spray of the waves ; and about noon we reached the shore, the transparency of the water enabling us to see the bottom at a considerable depth.

“ It was a handsome broad beach where we landed, behind which the hill,

into which the island was gathered, rose somewhat abruptly, and a point of rock at one end enclosed it in a sheltering way, and as there was an abundance of drift wood along the shore, it offered us a pleasant encampment.

“Among the successive banks of the beach, formed by the action of the waves, our attention, as we approached the island, had been attracted by one ten to twenty feet in breadth, of a dark-brown colour, composed, to the depth of seven or eight and twelve inches, entirely of the *larvæ* of insects. The cliffs and masses of rock along the shore were whitened by an incrustation of salt where the waves dashed up against them; and the evaporating water, which had been left in holes and hollows on the surface of the rocks, was covered with a crust of salt about one-eighth of an inch in thickness.

“Exposed to the sun, this became very white and fine, having the usual flavour of very excellent common salt, without any foreign taste; but only a little was collected for present use, as there was in it a number of small black insects.

“Carrying with us the barometer and other instruments, in the afternoon we ascended to the highest point of the island—a bare rocky peak 800 feet above the lake. Standing on the summit, we enjoyed an extended view of the lake, enclosed in a basin of rugged mountains, which sometimes left marshy flats and extensive bottoms between them and the shore, and in other places came directly down into the water with bold and precipitous bluffs. Following with our glasses the irregular shores, we searched for some indications of a communication with other bodies of water, or the entrance of other rivers; but the distance was so great that we could make out nothing with certainty. To the southward, several peninsular mountains, 3000 or 4000 feet high, entered the lake, appearing, so far as the distance and our position enabled us to determine, to be connected by flats and low ridges with the mountains in the rear. These are probably the islands usually indicated on maps of this region as entirely detached from the shore. The season of our operations was when the waters were at their lowest stage. At the season of high waters in the spring, it is probable that the marshes and low grounds are overflowed, and the surface of the lake considerably greater. In several places the view was of unlimited extent—here and there a rocky islet appearing above the water at a great distance; and beyond, every thing was vague and undefined. As we looked over the vast expanse of water spread out beneath us, and strained our eyes along the silent shores over which hung so much doubt and uncertainty, and which were so full of interest to us, I could hardly repress the almost irresistible desire to continue our exploration; but the lengthening snow on the mountains was a plain indication of the advancing season, and our frail linen boat appeared so insecure, that I was unwilling to trust our lives to the uncertainties of the lake. I therefore unwillingly resolved to terminate our survey here, and remain satisfied for the present with what we had

been able to add to the unknown geography of the region. We felt pleasure also in remembering that we were the first who, in the traditionary annals of the country, had visited the islands, and broken, with the cheerful sound of human voices, the long solitude of the place. From the point where we were standing, the ground fell off on every side to the water, giving us a perfect view of the island, which is twelve or thirteen miles in circumference, being simply a rocky hill, on which there is neither water nor trees of any kind; although the *Fremontia vermicularis*, which was in great abundance, might easily be mistaken for timber at a distance. The plant seemed here to delight in a congenial air, growing in extraordinary luxuriance seven to eight feet high, and was very abundant on the upper parts of the island, where it was almost the only plant. This is eminently a saline shrub; its leaves have a very salt taste; and it luxuriates in saline soils, where it is usually a characteristic. It is widely diffused all over this country.

"I accidentally left on the summit the brass cover to the object end of my spy-glass; and as it will probably remain there undisturbed by Indians, it will furnish matter of speculation to some future traveller. In our excursions about the island, we did not meet with any kind of animal; a magpie, and another larger bird, probably attracted by the smoke of our fire, paid us a visit from the shore, and were the only living things seen during our stay. The rock constituting the cliffs along the shore where we were encamped, is a talcous rock, or steatite, with brown spar.

"At sunset the temperature was 70 deg. We had arrived just in time to obtain a meridian altitude of the sun, and other observations were obtained this evening, which place our camp in latitude 41 deg. 10 min. 42 sec., and longitude 112 deg. 21 min. 05 sec. from Greenwich. From a discussion of the barometrical observations made during our stay on the shores of the lake, we have adopted 4200 feet for its elevation above the Gulf of Mexico.

"Out of the drift wood, we made ourselves pleasant little lodges, open to the water, and, after having kindled large fires to excite the wonder of any straggling savage on the lake shores, lay down, for the first time in a long journey, in perfect security; no one thinking about his arms. The evening was extremely bright and pleasant; but the wind rose during the night, and the waves began to break heavily on the shore, making our island tremble. I had not expected in our inland journey to hear the roar of an ocean surf; and the strangeness of our situation, and the excitement we felt in the associated interests of the place, made this one of the most interesting nights I remember during our long expedition.

"In the morning the surf was breaking heavily on the shore, and we were up early. The lake was dark and agitated, and we hurried through our scanty breakfast, and embarked—having first filled one of the buckets with water from the lake, of which it was intended to make salt. The sun had risen by the time

we were ready to start ; and it was blowing a strong gale of wind, almost directly off the shore, and raising a considerable sea, in which our boat strained very much. It roughened as we got away from the island, and it required all the efforts of the men to make any head against the wind and sea, the gale rising with the sun ; and there was danger of being blown into one of the open reaches beyond the island. At the distance of half a mile from the beach, the depth of water was sixteen feet, with a clay bottom ; but, as the working of the boat was very severe labour, and during the operation of sounding it was necessary to cease paddling, during which the boat lost considerable way, I was unwilling to discourage the men, and reluctantly gave up my intention of ascertaining the depth, and the character of the bed. There was a general shout in the boat when we found ourselves in one fathom, and we soon after landed on a low point of mud, immediately under the *butte* of the peninsula, where we unloaded the boat, and carried the baggage about a quarter of a mile to firmer ground.”

Analysis of the salt obtained by boiling the lake water :—

Chloride of sodium (common salt)	97.80
Chloride of calcium	0.61
Chloride of magnesium	0.24
Sulphate of soda	0.23
Sulphate of lime	1.12
	<hr/>
	100.00

Captain Fremont was informed by Mr. Walker, who had travelled with Bonneville, that on the upper part of a stream falling into the Utah lake, there are immense beds of rock-salt of very great thickness. Farther to the southward, the streams which flow into the Colorado, such as the Rio Virgen, and Gila River, are, near their mouths, impregnated with salt by the cliffs of rock-salt between which they flow.

They encamped early on the 12th of September on Clear Creek, at the foot of the high ridge ; one of the peaks of which was ascertained to be 4210 feet above the lake, or about 8400 feet above the sea. Behind these peaks ridges rise towards the Bear River Mountains, which are probably as high as the Wind River Chain. Among a variety of trees were birch (*betula*), the narrow-leaved poplar (*populus angustifolia*), several kinds of willow (*salix*), hawthorn (*crataegus*), alder (*alnus viridis*), and *cerasus*, with an oak allied to *quercus alba*, but very distinct from that or any other species in the United States. They supped on *sea-gulls* killed near the lake.

They proceeded on their journey, greatly fatigued, towards Oregon, and until relieved by supplies brought by parties sent for provisions to Fort Hall, suffered greatly from want of food, although they had killed and ate one of their horses.

On the 15th of September they entered a long ravine leading to a pass in

the dividing ridge between the waters of Bear River and the Snake River, or Lewis's Fork of the Columbia; the way almost entirely covered by compact fields of luxuriant artemisia. Departing at this point from the waters of Bear River, and of the geographical basin which encloses the system of rivers and creeks which belong to the Great Salt Lake, Captain Fremont says,

"The bottoms of this river (Bear), and of some of the creeks which I saw, form a natural resting and recruiting station for travellers, now, and in all time to come. The bottoms are extensive; water excellent; timber sufficient; the soil good, and well adapted to the grains and grasses suited to such an elevated region. A military post, and a civilised settlement, would be of great value here; and cattle and horses would do well where grass and salt so much abound. The lake will furnish exhaustless supplies of salt. All the mountain sides here are covered with a valuable nutritious grass, called bunch grass, from the form in which it grows, which has a second growth in the fall. The beasts of the Indians were fat upon it; our own found it a good subsistence; and its quantity will sustain any amount of cattle, and make this truly a bucolic region.

"We met here an Indian family on horseback, which had been out to gather service-berries, and were returning loaded. This tree was scattered about on the hills, and the upper part of the pass was timbered with aspen (*populus trem.*); the common blue flowering flax occurring among the plants. The approach to the pass was very steep; and the summit about 6300 feet above the sea. We descended by a steep slope into a broad open valley—good soil—from four to five miles wide; coming down immediately upon one of the headwaters of the Pannack river, which here loses itself in swampy ground. The appearance of the country here is not very interesting. On either side is a regular range of mountains of the usual character, with a little timber, tolerably rocky on the right, and higher and more smooth on the left, with still higher peaks looking out above the range. The valley afforded a good level road, but it was late when it brought us to water, and we encamped at dark. The north-west wind had blown up very cold weather, and the artemisia, which was our fire-wood to-night, did not happen to be very abundant. This plant loves a dry sandy soil, and cannot grow in the good bottoms where it is rich and moist, but on every little eminence, where water does not rest long, it maintains absolute possession. Elevation above the sea, about 5100 feet.

"At night scattered fires glimmered along the mountains, pointing out camps of the Indians; and we contrasted the comparative security in which we travelled through this country, with the guarded vigilance we were compelled to exert among the Sioux and other Indians on the eastern side of the Rocky Mountains. At sunset the thermometer was at 50 deg., and at midnight at 30 deg.

"There is throughout this mountain country a remarkable difference between

the morning and mid-day temperatures, which at this season was very generally 40 deg. or 50 deg., and occasionally greater ; and frequently, after a very frosty morning, the heat in a few hours would render the thinnest clothing agreeable. The Pannack River was before us ; the valley being here a mile and a half wide, fertile, and bordered by smooth hills, not over 500 feet high, partly covered with cedar ; a high ridge, in which there is a prominent peak, rising behind those on the left. We continued to descend this stream, and found on it at night a warm and comfortable camp. Flax occurred so frequently during the day as to be almost a characteristic, and the soil appeared excellent. Longitude, from mean of satellite and chronometer, 112 deg. 29 min. 52 sec. ; and latitude, by observation, 42 deg. 44 min. 40 sec.

“ *September 18.*—We emerged on the plains of the Columbia, in sight of the famous ‘Three Buttes,’ a well-known landmark in the country, distant about forty-five miles. The French word *butte*, which so often occurs in this narrative, is retained from the familiar language of the country, and identifies the objects to which it refers. It is naturalised in the regions of the Rocky Mountains ; and, even if desirable to render it in English, I know of no word which would be its precise equivalent. It is applied to the detached hills and ridges which rise abruptly, and reach too high to be called hills or ridges, and not high enough to be called mountains. *Knob*, as applied in the Western States, is their most descriptive term in English. *Cerro* is the Spanish term ; but no translation, or paraphrasis, would preserve the identity of these picturesque landmarks, familiar to the traveller, and often seen at a great distance. Covered, as far as could be seen, with artemisia, the dark and ugly appearance of this plain obtained for it the name of the ‘Sage Desert ;’ and we were agreeably surprised, on reaching the Portneuf River, to see a beautiful green valley with scattered timber spread out beneath us, on which, about four miles distant, were glistening the white walls of Fort Hall. We had a night of snow and rain, and the thermometer at sunrise was at 34 deg. ; the morning was dark, with a steady rain, and there was still snow on the ground, with abundance on the neighbouring hills and mountains. Ice made tolerably thick during the night ; next morning the weather cleared up very bright, with a temperature at sunrise of 29 deg. ; the thermometer, at sunset, 48 deg.”

The early approach of winter, and the difficulty of supporting a large party, determined Captain Fremont to send back a number of the men, who had become satisfied that they were not fitted for the laborious service and frequent privation to which they were necessarily exposed, and which there was reason to believe would become more severe in the further extension of the voyage.

FORT HALL.—Except that there is a greater quantity of wood used in its construction, Fort Hall very much resembles the trading posts east of the Rocky Mountains, described by Captain Fremont, and would be another excel-

lent post of relief for the emigration. It is in the low, rich bottom of the valley, apparently twenty miles long, formed by the confluence of Portneuf River with Lewis's Fork of the Columbia, which it enters about nine miles below the fort. Allowing fifty miles for the road from the *Beer Springs* of Bear River to Fort Hall, its distance along the *travelled* road from the town of Westport, on the frontier of Missouri, by way of Fort Laramie and the great South Pass, is 1323 miles.

"Beyond this place, on the line of road along the *barren* valley of the Upper Columbia, there does not occur, for a distance of nearly 300 miles to the westward, a fertile spot of ground sufficiently large to produce the necessary quantity of grain, or pasturage enough to allow even a temporary repose to the emigrants. On their recent passage, they had been able to obtain, at very high prices, and in insufficient quantity, only such assistance as could be afforded by a small and remote trading post; which, in the supply of its own wants, had necessarily drawn around it some of the resources of civilisation, but which obtained nearly all its supplies from Vancouver, by a difficult water-carriage of 250 miles up the Columbia River, and a land-carriage by pack horses of 600 miles. An American military post, sufficiently strong (and all others which may be established on the line to Oregon) would naturally form the *nucleus* of a settlement, at which supplies and repose would be obtained by the emigrant or trading caravans, which may hereafter traverse these elevated and, in many places, desolate and inhospitable regions."

By observation longitude 112 deg. 29 min. 54 sec., latitude 43 deg. 01 min. 30 sec., elevation above the sea 4500 feet.

Captain Fremont resumed the journey down the valley on the 22nd of September, the weather being very cold, and the rain coming in hard gusts with the wind.

The river bottoms he found narrow and swampy, with frequent sloughs; after crossing the Pannack, the road continued along the uplands, covered with artemisia bushes, and encamped under a grove of willows, at the upper end of a group of islands about half a mile above the *American Falls* of Snake River.

"The river here enters between low mural banks, which consist of a fine vesicular trap rock, the intermediate portions being compact and crystalline. Gradually becoming higher in its downward course, these banks of scoriated volcanic rock form,

with occasional interruptions, its characteristic feature along the whole line to the Dalles of the Lower Columbia, resembling a chasm which had been rent through the country, and which the river had afterwards taken for its bed. The immediate valley of the river is a high plain covered with black rocks and artemisias. In the south is a bordering range of mountains, which, although not very high, are broken and covered with snow; and at a great distance to the north is seen the high, snowy line of the Salmon River Mountains, in front of which stand out prominently in the plain the three isolated rugged-looking little mountains, commonly known as the *Three Buttes*. Between the river and the distant Salmon River range, the plain is represented as so entirely broken up and rent into chasms as to be impracticable for a man even on foot. By measurement, the river above is 870 feet wide, immediately contracted at the fall in the form of a lock, by jutting piles of scoriaceous basalt, over which the foaming river must present a grand appearance at the time of high water. At sunset the temperature was 54 deg. By observation, latitude 42 deg. 47 min. 05 sec., and the longitude 112 deg. 40 min. 13 sec.

“Thermometer at sunrise 47 deg., September 25th. The road led along the river, which is full of rapids and small falls. Grass is very scanty; and along the rugged banks are scattered cedars, with an abundance of rocks and sage. Travelled fourteen miles; encamped in the afternoon near the river, on a rocky creek, the bed of which was occupied with boulders of large size. For the last three or four miles the right bank of the river has a palisaded appearance. The thermometer at evening was at 55 deg., the sky almost overcast, and the barometer indicated an elevation of 4400 feet.”

On the 8th of October, they travelled along a ridge on the right, having scattered pines on the upper parts; and then continuing along the river bottom, encamped in the evening on the right bank of the river, a mile above the mouth, and early the next morning arrived at Fort *Boisée*. This is a dwelling-house on the right bank of Snake River, about a mile below the mouth of Rivière *Boisée*.

During the day there were considerable numbers of miserable half-naked Indians around the fort, who had arrived from the neighbouring mountains. During the summer the only subsistence of these people is derived from the salmon, of which they are not provident enough to lay up a sufficient store for the winter, during which many of them die from absolute starvation.

While the summer weather and the salmon lasted, they lived scattered along the different streams where the fish were to be found; and as soon as the winter-snows began to fall, little smokes would be seen rising among the mountains, where they would be found in miserable groups, starving during the winter, and sometimes, according to report, “reduced to the horror of cannibalism—the strong, of course, preying on the weak. Certain it is, they are driven to any extremity for food, and eat every insect and every creeping thing,

however loathsome and repulsive; snails, lizards, ants, all are devoured with the readiness and greediness of mere animals."

In common with all the other Indians they had encountered since reaching the Pacific waters, these people use the Shoshonee or Snake language.

By observations, the longitude of the fort is 116 deg. 47 min. 00 sec., latitude 43 deg. 49 min. 22 sec., and elevation above the sea 2100 feet.

"We were now, October 13th," says Captain Fremont, "about to leave the valley of the great southern branch of the Columbia River, to which the absence of timber, and the scarcity of water, give the appearance of a desert, to enter a mountainous region where the soil is good, and in which the face of the country is covered with nutritious grasses and dense forest-land, embracing many varieties of trees peculiar to the country, and on which the timber exhibits a luxuriance of growth unknown to the eastern part of the continent and to Europe. This mountainous region connects itself in the southward and westward with the elevated country belonging to the Cascade or California range, and forms the eastern limit of the fertile and timbered lands along the desert and mountainous region included within the Great Basin," a term which Captain Fremont applies, "to the intermediate region between the Rocky Mountains and the next range, containing many lakes, with their own system of rivers and creeks (of which the Great Salt Lake is the principal), and which have no connexion with the ocean or the great rivers which flow into it. This Great Basin is yet to be adequately explored. And here, on quitting the banks of a sterile river, to enter on arable mountains, the remark may be made, that, on this western slope of the American continent, the usual order or distribution of good and bad soil is often reversed; the river and creek bottoms being often sterile, and darkened with the gloomy and barren artemisia; while the mountain is often fertile, and covered with rich grass, pleasant to the eye, and good for flocks and herds."

Leaving the Snake River, which, from this point, is said to flow through cañons, amidst rocky and impracticable mountains, where there is no possibility of travelling with animals, the party ascended a long and somewhat steep hill; and, crossing the dividing ridge, came down into the valley of *Burnt River*. The average breadth of the stream here is thirty feet; it is well fringed with the usual small timber, and the soil in the bottoms is good, with tolerable grass.

They now travelled through a mountainous country; the stream running rather in a ravine than a valley, and the road bad, and dangerous for single waggons, frequently crossing the stream where the water is sometimes deep. The animals were greatly fatigued in climbing up and descending a succession of steep ascents; and the common trail, which leads along the mountain side at places where the river strikes the base, is difficult even on horseback. The appearance of the country was green and refreshing after the journey down the

parched valley of Snake River. The mountains were covered with good bunch grass (*festuca*); the water of the streams was cold and pure; their bottoms were wooded with various kinds of trees; and huge lofty and picturesque precipices arose where the river cuts through the mountains. He says,

“ For several weeks the weather in the daytime has been very beautiful, clear, and warm; but the nights, in comparison, very cold. During the night of the 16th of October there was ice a quarter of an inch thick in the lodge; and at daylight the thermometer was at 16 deg., and the same at sunrise; the weather being calm and clear. The annual vegetation now is nearly gone, almost all the plants being out of bloom.

“ Travelling across the affluents to Powder River, the country became constantly more pleasant and interesting. The soil appeared to be very deep, black, and extremely good, as well among the hollows of the hills on the elevated flats, as on the river bottoms; the vegetation being such as is usually found in good ground.*”

The *Grand Rond* is a level basin, or mountain valley, “ covered with good grass, on a rich soil, abundantly watered, and surrounded by high and well-timbered mountains, and its name descriptive of its form—the great circle—is about twenty miles in diameter, and may, in time, form a superb county.” Captain Fremont remarked, in descending, some white spots glistening on the plain, which he found to be the bed of a dry salt lake, or marsh, firm and bare, and covered thickly with a fine white powder, containing a large quantity of carbonate of soda (33 in 100 parts).

“ The old grass had been lately burned off from the surrounding hills, and, wherever the fire had passed, there was a recent growth of strong, green, and vigorous grass; and the soil of the level prairie, which sweeps directly up to the foot of the surrounding mountains, appears to be very rich, producing flax spontaneously and luxuriantly in various places.†

Next day (18th of October) they travelled in a nearly north direction across the valley; and reached one of the principal streams, where the emigrants appeared to have held some consultation as to their further route.

Captain Fremont then passed out of the *Grand Rond* along a creek, which, for a short distance, runs in a kind of rocky chasm. “ Crossing a low point, which

was a little rocky, the trail conducted into the open valley of the stream—a handsome place for farms, the soil being rich and black.

“October 20.—The pines, as we proceeded downwards were more dense, and still retained their magnificent size. The larches cluster together in masses on the sides of the mountains, and their yellow foliage contrasts handsomely with the green of the balsam and other pines. After a few miles we ceased to see any pines, and the timber consisted of several varieties of spruce, larch, and balsam pine, which have a regularly conical figure. These trees appeared from sixty to nearly 200 feet in height; the usual circumference being ten to twelve feet, and in the pines sometimes twenty-one feet.”

On the 25th of October, the party arrived at a rocky streamlet of the Walla-walla river. Crossing the stream they travelled over a hilly country with good bunch grass; the river bottom, which generally contains the best soil in other countries, being here a sterile level of rocks and pebbles. They had found the soil in the Blue Mountains to be of excellent quality, and it appeared also to be good here among the lower hills. Reaching a little eminence, over which the trail passed, they had an extensive view along the course of the river, which was divided and spread over its bottom in a net-work of water, receiving several other tributaries from the mountains. There was a band of several hundred horses grazing on the hills about two miles a-head; and as they advanced on the road they met other bands, which Indians were driving out to pasture also on the hills. The hills and mountains were rich in grass, the bottoms barren and sterile.

They passed on the way several unfinished houses, and some cleared patches where corn and potatoes were cultivated, and arrived at the Walla-walla missionary establishment, which then consisted, of one *adobe house*—i. e. built of unburnt bricks, as in Mexico.

On the next morning the party arrived at the Nez Percé fort, a few hundred yards above the junction of the Walla-walla with the Columbia River. Here they had the first view of this river, and found it “about 1200 yards wide, and presenting the appearance of a fine navigable stream.” The post is on the bank of the Columbia, on a plain of bare sands, from which the air was literally filled with clouds of dust and sand, during one of the few days they remained here. Captain Fremont says “the appearance of the post and country was without interest, except that we here saw, for the first time, the great river on which the course of events for the last half century has been directing attention and conferring historical fame. The river, is, indeed, a noble object, and has here attained its full magnitude. About nine miles above, and in sight from the heights about the post, is the junction of the two great forks which constitute the main stream—that on which we had been travelling from Fort Hall, and known by the names of Lewis’s Fork, Shoshonee, and Snake River, and the North Fork, which has retained the name of Columbia, as being the main stream. The union of two large streams, coming one from the south-east, and the

other from the north-east, and meeting in what may be treated as the geographical centre of the Oregon valley, thence doubling the volume of water to the ocean, while opening two great lines of communication with the interior continent, constitutes a feature in the map of the country which cannot be overlooked; and it was probably in reference to this junction of waters, and these lines of communication, that this post was established. They are important lines, and from the structure of the country must for ever remain so—one of them leading to the South Pass, and to the valley of the Mississippi; the other to the pass at the head of the Athabasca River, and to the countries drained by the waters of the Hudson Bay. The British fur companies now use both lines; the Americans, in their emigration to Oregon, have begun to follow the one which leads towards the United States. Bateaux from tide-water ascend to the junction, and thence high up the North Fork or Columbia. Land conveyance only is used upon the line of Lewis's Fork. To the emigrants to Oregon, the Nez Percé is a point of interest, as being, to those who choose it, the termination of their overland journey. The broad expanse of the river here invites them to embark on its bosom; and the lofty trees of the forest furnish the means of doing so.

“From the South Pass to this place is about 1000 miles; and as it is about the same distance from that pass to the Missouri River, at the mouth of the Kansas, it may be assumed that 2000 miles is the *necessary* land travel in crossing from the United States to the Pacific Ocean on this line. From the mouth of the Great Platte it would be about one hundred miles less.

“By a meridional altitude of the sun, the only observation that the weather permitted us to obtain, the mouth of the Walla-walla River is in latitude 46 deg. 03 min. 46 sec.; and, by the road we had travelled, 612 miles from Fort Hall. At the time of our arrival, a considerable body of the emigrants, under the direction of Mr. Applegate, a man of considerable resolution and energy, had nearly completed the building of a number of *Mackinaw* boats, in which they proposed to continue their further voyage down the Columbia. I had seen, in descending the Walla-walla River, a fine drove of several hundred cattle, which they had exchanged for Californian cattle, to be received at Vancouver, and which are considered a very inferior breed. The other portion of the emigration had preferred to complete their journey by land along the banks of the Columbia, taking their stock and waggons with them.

“Having reinforced our animals with eight fresh horses, hired from the post, and increased our stock of provisions with dried salmon, potatoes, and a little beef, we resumed our journey down the left bank of the Columbia, being guided on our road by an intelligent Indian boy, whom I had engaged to accompany us as far as the Dalles.”

Captain Fremont with his party descended to Fort Vancouver, where he found

the Hudson Bay Company's ship ready to sail for England, being detained only in waiting the arrival of the express bateaux, which descend the Columbia and its north Fork with the overland mail from Canada and Hudson Bay, which had been delayed beyond their usual time. He waited upon Dr. M'Laughlin, who received him with courtesy and hospitality, and was immediately supplied by him with the necessary stores and provisions to refit his party in the intended journey through Oregon to California and back to the United States; and also with a Mackinaw boat and canoes, manned with Canadian and Iroquois voyageurs and Indians, for their transportation to the Dalles of the Columbia, and a letter of recommendation and credit for any officers of the Hudson Bay Company into whose posts they might be driven by unexpected misfortune. The supplies were paid for, but every hospitable attention was extended to Captain Fremont.

There were many American emigrants at the fort; others had crossed the river into their *land of promise*—the Willamette Valley. Others were daily arriving; and all of them had been furnished with shelter, so far as it could be afforded by the buildings connected with the establishment. Necessary clothing and provisions (the latter to be afterwards returned in kind from the produce of their labour) were also furnished. This friendly assistance was of very great value to the emigrants, whose families were otherwise exposed to much suffering from the winter rains, which had now commenced, at the same time that they were in want of all the common necessities of life. Those who had taken a water conveyance at the Nez Percé Fort continued to arrive safely. The party which had passed over the Cascade Mountains were reported to have lost a number of their animals; and those who had driven their stock down the Columbia had brought them safely in, and found for them a ready and very profitable market, and were then proposing to return to the States in spring for another supply.

The object of Captain Fremont's instructions had been, he says, "fulfilled, in having connected his reconnoissance with the surveys of Captain Wilkes."

On the 25th of November, he departed on a perilous and arduous expedition up the Fall River and over the mountain country to California.

"It was a serious enterprise at the commencement of winter, to undertake the traverse of such a region, and with a party consisting only of twenty-five persons, and they of many nations—American, French, German, Canadian, Indian, and coloured—and most of them young, several being under twenty-one years of age. All knew that a strange country was to be explored, and dangers and hardships to be encountered; but no one blenched at the prospect. On the contrary, courage, and confidence animated the whole party. Cheerfulness, readiness, subordination, prompt obedience, characterised all; nor did any extremity of peril and privation, to which we were afterwards exposed, ever belie, or derogate from, the fine spirit of this brave and generous commencement. The course of the narrative will show at what point, and for what reasons, we were prevented from the

complete execution of this plan, after having made considerable progress upon it, and how we were forced by desert plains and mountain ranges, and deep snows, far to the south, and near to the Pacific Ocean, and along the western base of the Sierra Nevada."

Their route lay south, up the valley of a tributary of the Columbia, called Fall River, and along the eastern base to Tlamath Lake. They travelled over a region in parts traversed by ravines, in others spreading into prairies, but generally rugged and high, and partly covered with pines, cedars, and other trees.

With the cold severe, the water in many places frozen, the snow on the heights compelling the party to deviate from the last summer route, until the 10th of December, "when," Captain Fremont says, "the country began to improve; and about 11 o'clock we reached a spring of cold water on the edge of a savannah, or grassy meadow, which our guides informed us was an arm of the Tlamath Lake; and a few miles further we entered upon an extensive meadow, or lake of grass, surrounded by timbered mountains. This was the Tlamath Lake. It was a picturesque and beautiful spot, and rendered more attractive to us by the abundant and excellent grass which our animals, after travelling through pine forests, so much needed; but the broad sheet of water which constitutes a lake was not to be seen. Overlooking it, immediately west, were several snowy knobs, belonging to what we have considered a branch of the Cascade range. A low point covered with pines made out into the lake, which afforded us a good place for an encampment, and for the security of our horses, which were guarded in view on the open meadow.

"The character of courage and hostility attributed to the Indians of this quarter induced more than usual precaution; and seeing smokes rising from the middle of the lake (or savannah) and along the opposite shores, I directed the howitzer to be fired. It was the first time our guides had seen it discharged; and the bursting of a shell at a distance, which was something like the second fire of the gun, amazed and bewildered them with delight. It inspired them with triumphant feelings; but on the camps at a distance the effect was different, for the smokes in the lake and on the shores immediately disappeared.

"The point on which we were encamped forms, with the opposite eastern shore, a narrow neck, connecting the body of the lake with a deep cove or bay which receives the principal affluent stream, and over the greater part of which the water (or rather ice) was at this time dispersed in shallow pools. Among the grass and scattered over the prairie lake, appeared to be similar marshes. It is simply a shallow basin, which, for a short period at the time of melting snows, is covered with water from the neighbouring mountains; but this probably soon runs off, and leaves for the remainder of the year a green savannah, through the midst of which the River Tlamath, which flows to the ocean, winds its way to the outlet on the south-western side.

"That day," says Captain Fremont, "we rode out towards the village in the

middle of the lake, which one of our guides had previously visited. It could not be directly approached, as a large part of the lake appeared a marsh, and there were sheets of ice among the grass on which our horses could not keep their footing. We therefore followed the guide for a considerable distance along the forest, and then turned off towards the village, a few large huts, on the tops of which were collected the Indians. When we had arrived within half a mile of the village, two persons were seen advancing to meet us; and, to please the fancy of our guides, we ranged ourselves into a long line, riding abreast, while they galloped ahead to meet the strangers.

"They were the village chief and his wife, who, in excitement and alarm at the unusual event and appearance, had come out to meet their fate together. The chief was a very prepossessing Indian, with very handsome features, and a singularly soft and agreeable voice—so remarkable as to attract general notice.

"The huts were grouped together on the bank of the river, which, from being spread out in a shallow marsh at the upper end of the lake, was collected here into a single stream. They were large round huts, perhaps twenty feet in diameter, with rounded tops, on which was the door by which they descended into the interior. Within, they were supported by posts and beams.

"Almost like plants, these people seem to have adapted themselves to the soil, and to be growing on what the immediate locality afforded. Their only subsistence at this time appeared to be a small fish, great quantities of which that had been smoked and dried were suspended on strings about the lodge. Heaps of straw were lying around; and their residence, in the midst of grass and rushes, had taught them a peculiar skill in converting this material to useful purposes. Their shoes were made of straw or grass, which seemed well adapted for a snowy country; and the women wore on their head a closely-woven basket, which made a very good cap. Among other things were party-coloured mats about four feet square, which we purchased to lay on the snow under our blankets, and to use for table-cloths. Dogs, resembling wolves, were sitting on the tops of the huts. The language spoken by these Indians is different from that of the Shoshonee and Columbia River tribes; and otherwise than by signs they cannot understand each other. They made us comprehend that they were at war with the people who lived to the southward and to the eastward. The river on which they live enters the Cascade Mountains on the western side of the lake, and breaks through them by a passage impracticable for travellers; but over the mountains to the northward, are passes which present no other obstacle than the almost impenetrable forests. Unlike any Indians we had previously seen, these wore shells in their noses.

"By observation, the latitude of the camp was 42 deg. 56 min. 51 sec.; and the diameter of the lake, or marshy meadow, as has been intimated, about twenty miles. It is a picturesque and beautiful spot; and, under the hand of cultivation,

might become a little paradise. Game is found in the forest; timbered and snowy mountains skirt it, and fertility characterises it. Situated near the heads of three rivers, and on the line of inland communication with California, and near to Indians noted for treachery, it will naturally, in the progress of the settlement of Oregon, become a point for military occupation and settlement.

“On the morning of the 12th of December, the camp was thronged with Tlamath Indians from the south-eastern shore of the lake; but, knowing the treacherous disposition which is a remarkable characteristic of the Indians south of the Columbia, the camp was kept constantly on its guard. I was not unmindful of the disasters which Smith and other travellers had met with in this country, and therefore was equally vigilant in guarding against treachery and violence.”

After crossing this marshy lake in which were frozen ponds, they entered a pine-forest, and traversed a broad mountain, for seven hours during a snow-storm, and on the 15th, crossed the upper stream of the Sacramento. On the 16th, the snow was about three feet deep, and the branches of the pines overlaid with snow. And they continued ascending until they reached open ground on the verge of a vertical and rocky mountain wall; beneath which lay a green valley and lake below. To the east not a tree was to be seen.

“We were now immediately on the verge of the forest land, in which we had been travelling so many days; and, looking forward to the east, scarce a tree was to be seen. Viewed from our elevation, the face of the country exhibited only rocks and grass, and presented a region in which the artemisia became the principal wood, furnishing to its scattered inhabitants fuel for their fires, building material for their huts, and shelter for the small game which ministers to their hunger and nakedness. Broadly marked by the boundary of the mountain wall, and immediately below us, were the *first waters* of that Great Interior Basin which has the Wahsatch and Bear River Mountains for its eastern, and the Sierra Nevada for its western rim; and the edge of which we had entered upwards of three months before, at the Great Salt Lake.

“When we began to think about descending, which here was impossible, we turned towards the north, travelling always along the rocky wall. We continued on for four or five miles, making ineffectual attempts at several places; and at length succeeded in getting down at one which was extremely difficult of descent. Night had closed in before the foremost reached the bottom, and it was dark before we all found ourselves together in the valley. There were three or four half-dead dry cedar-trees on the shore, and those who first arrived kindled bright fires to light on the others. One of the mules rolled over and over 200 or 300 feet into a ravine, but recovered himself, without any other injury than to his pack; and the howitzer was left midway on the mountain until morning. By observation, the latitude of this encampment is 42 deg. 57 min. 22 sec. We were now in a country where the

scarcity of water and of grass makes travelling dangerous, and great caution was necessary. We continued next day on the trail along the narrow strip of land between the lake and the high rocky wall, from which we had looked down two days before. Almost every half mile we crossed a little spring, or stream of cold pure water; and the grass was certainly as fresh and green as in the early spring. From the white efflorescence along the shore of the lake, we were enabled to judge that the water was impure, like that of the lakes we subsequently found; but the mud prevented us from approaching it."

Passing over the marshy lake, and travelling for two days, they came suddenly in sight of another and much larger lake, which, along its eastern shore, was closely bordered by high black ridge which walled it in by a precipitous face. Throughout this region the face of the country was characterised by precipices of black volcanic rock, generally enclosing the valleys of streams, and frequently terminating the hills. "Spread out over a length of twenty miles, the lake when we first came in view, presented a handsome sheet of water; and I gave to it the name of Lake Albert, in honour of the chief of the corps to which I belonged. The fresh-water stream we had followed emptied into the lake by a little fall. The miry ground in the neighbourhood of the lake did not allow us to examine the water conveniently, and being now on the borders of a desert country, we were moving cautiously. We were following an Indian trail which led along the steep rocky precipice; a black ridge along the western shore holding out no prospect whatever. The white efflorescences which lined the shore like a bank of snow, and the disagreeable odour which filled the air as soon as we came near, informed us too plainly that the water belonged to one of those foetid salt lakes which are common in this region. We continued until late in the evening to work along the rocky shore, but as often afterwards, the dry inhospitable rock deceived us; and, halting on the lake, we kindled up fires to guide those who were straggling along behind. We tried the water, but it was impossible to drink it, and most of the people to-night lay down without eating; but some of us, who had always a great reluctance to close the day without supper, dug holes along the shore, and obtained water, which, being filtered, was sufficiently palatable to be used, but still retained much of its nauseating taste. There was very little grass for the animals, the shore being lined with a luxuriant growth of chenopodiaceous shrubs, which burnt with a quick bright flame, and made our firewood.

"We ascended the bordering mountain in order to obtain a more perfect view of the lake in sketching its figure; hills sweep entirely around its basin, from which the waters have no outlet."

On the 22nd of December, they left this forbidding lake. Impassable rocky ridges barred the progress to the eastward, and they travelled towards the south, over an extensive sage plain. Ahead, and a little to the left, a range of snowy mountains arose. On the summit of the ridge, snow was visible, and there being

every indication of a stream at it, rode on until after dark, halted among the sage bushes on the open plain, without either grass or water. Two India-rubber bags had been filled with water in the morning, which afforded sufficient for the camp; and rain in the night formed pools, which relieved the thirst of the animals.

The party rested on Christmas-day, and the expedition then travelled south over a country interspersed with large and small basins, into which the mountain waters run down, forming small lakes; they present a perfect level, into which the mountain torrents run down abruptly. Between the basins the dividing ridges are not usually high; and it is probable that, in the seasons of high floods many of these basins are in communication. On either side, the mountains, though not very high, appear to be rocky and sterile. Latitude of the encampment 42 deg. north.

They continued next day over a broad pass; snow about a foot deep; remarkably large cedars; a horse stolen in the night by the Indians. As they discovered and travelled along lower grounds, foggy weather prevailed; the country travelled over, was rugged, or marshy and muddy, with traces of sheep and antelopes.

On the 6th of January, they entered a valley, and crossing the bed of another lake, over mud and sand, they reached hot springs and a grassy plat. Captain Fremont says—

“This is the most extraordinary locality of hot springs we have met during the journey. The basin of the largest one has a circumference of several hundred feet; but there is at one extremity a circular space of about fifteen feet in diameter, entirely occupied by the boiling water. It boils up at irregular intervals, and with much noise. The water is clear, and the spring deep; a pole, about sixteen feet long, was easily immersed in the centre; but we had no means of forming a good idea of the depth. It was surrounded on the margin with a border of *green* grass, and near the shore the temperature of the water was 206 deg. We had no means of ascertaining that of the centre, where the heat was greatest; but, by dispersing the water with a pole, the temperature at the margin was increased to 208 deg., and in the centre it was doubtless higher. By driving the pole towards the bottom, the water was made to boil up with increased force and noise. There are several other interesting places, where water and smoke or gas escape; but they would require a long description. The water is impregnated with common salt, but not so much so as to render it unfit for general cooking; and a mixture of snow made it pleasant to drink.

“In the immediate neighbourhood, the valley bottom is covered almost exclusively with chenopodiaceous shrubs, of greater luxuriance and larger growth than we have seen them in any preceding part of the journey. Latitude of the hot springs, 40 deg. 39 min. 46 sec. north.

“Our situation now required caution. Including those which gave out from the injured condition of their feet, and those stolen by Indians, we had lost, since leaving the Dalles of the Columbia, fifteen animals; and of those, nine had been

left in the last few days. I, therefore, determined, until we should reach a country of water and vegetation, to feel our way ahead, by having the line of route explored some fifteen or twenty miles in advance, and only to leave a present encampment when the succeeding one was known.

"Using our old plan of breaking the road with alternate horses, we reached a creek in the evening, and encamped on a dry open place in the ravine.

"Many of the men looked badly, and some this evening were giving out."

On the 10th of January the expedition travelled onwards in a southern direction through the basin along the ridge. On a large trail there is never any doubt of finding suitable places for encampments.

Passing a defile between the mountains they descended rapidly for about 2000 feet: when a lake about twenty miles broad opened before them like the ocean. One of the high neighbouring peaks was ascended to obtain a better view. The waves of the lake beneath were curling in the breeze, and from their dark green colour it would appear that the water was very deep. The mountains seemed to enclose it in all parts; but the western end communicated with the line of basins which were passed to the north; and on the opposite side its shores swept a ridge of the snowy mountains of the great Sierra. This lake appears to have been a new discovery, except to the Indians.

On the next day herds of mountain-sheep were seen, and the party encamped on a little stream at the mouth of the defile, about a mile from the margin of the lake. The shore was rocky; with a beach resembling that of the sea. On some large *granite* boulders scattered about the shore, there was a coating of a calcareous substance, in some places a few inches, and in others a foot in thickness. The hills were of primitive rock; the latter covered with this substance.

This place appeared to be a favourite Indian camping place.

On the 13th of January they followed a broad Indian trail along the shore of the lake to southward. After travelling a short distance, the water swept the foot of the precipitous mountains, the peaks were about 3000 feet above the lake. The trail wound along the base of these precipices, against which the water dashed below, by a way nearly impracticable for them to bring along the howitzer. During a greater part of the morning, the lake was nearly hidden by a snow-storm, and the waves broke on the narrow beach in a long line of foaming surf, five or six feet high.

They saw several flocks of sheep, but did not succeed in killing any. Ducks were riding on the waves, and several large fish were seen. The mountain sides were crusted with calcareous cement. There were chenopodiaceous and other shrubs along the beach, and, at the foot of the rocks, an abundance of *ephedra occidentalis*. Towards evening, the snow began to fall heavily, and the country had a wintry appearance.

On the following morning the snow was rapidly melting under a warm sun.

The delay occasioned in bringing up the gun, prevented the party from travelling more than nine miles, when they encamped on the shore, opposite a remarkable rock in the lake. It rose, according to estimate, 600 feet above the water, and, from the point viewed presented a pretty exact outline of the great pyramid of Cheops. Like other rocks along the shore, it seemed to be encrusted with calcareous cement. This suggested a name, and it was called Pyramid Lake.

The elevation of this lake above the sea is 4890 feet, nearly 700 feet higher than the Great Salt Lake, from which it lies nearly west, distant about eight degrees of longitude. This is the nearest lake to the western confine, and the Great Salt Lake the nearest to the eastern boundary of the Great Basin which lies between the base of the Rocky Mountains and the Sierra Nevada.

Captain Fremont observes, in speaking of the river flowing into this lake—"Groves of large cotton-wood, which we could see at the mouth of the river, indicated that it was a stream of considerable size: and, at all events, we had the pleasure to know that now we were in a country where human beings could live. Accompanied by an Indian, who appeared at the confine, we resumed our road, passing on the way several caves in the rock, where there were baskets and seeds, but the people had disappeared. We saw also horse-tracks along the shore.

"Reaching the groves, we found the *inlet* of a large fresh-water stream, and all at once were satisfied that it was neither Mary's River nor the waters of the Sacramento, but that we had discovered a large interior lake, which the Indians informed us had no outlet. It is about thirty-five miles long, and, by the mark of the water-line along the shores, the spring level is about twelve feet above its present waters. The chief commenced speaking in a loud voice as we approached; and parties of Indians armed with bows and arrows issued from the thickets. We selected a strong place for our encampment—a grassy bottom, nearly enclosed by the river, and furnished with abundant firewood. The village, a collection of straw huts, was a few hundred yards higher up." The Indians brought them plenty of large salmon-trout. They were of extraordinary size, generally from two to four feet in length and of delicious flavour. Mr. Walker, who passed among some lakes lying more to the eastward, says this fish is common to the streams of the inland lakes, and constitute the chief subsistence of these people. Latitude of encampment, 39 deg. 51 min. 13 sec., by observation.

On the 26th of January they continued the journey along this stream, which they called Salmon-trout River. It was timbered with large cotton-woods, and the waters were clear and pure. The mountains of the great Sierra, which rose on the right, were covered with snow; below, the temperature was mild and pleasant.

The country was oftentimes tolerably level. Indian smokes arose in all directions, and are made from one camp to another when the country is alarmed. The horses and mules nearly worn out. They continued for several days tra-

velling to the south, to the upper waters of the stream, followed from the Pyramid Lake. The morning of January 25th was cold and bright, and as the sun rose the day became beautiful. Captain Fremont then observes—"A party of twelve Indians came down from the mountains to trade in pine-nuts, of which each one carried a little bag. These seemed now to be the staple of the country; and, whenever we met an Indian, his friendly salutation consisted in offering a few nuts to eat and to trade: their only arms were bows and flint-pointed arrows. It appeared that in almost all the valleys the neighbouring bands were at war with each other; and we had some difficulty in prevailing on our guides to accompany us on this day's journey, being at war with the people on the other side of a large snowy mountain which lay before us. The general level of the country appeared to be getting higher, and we were gradually entering the heart of the mountains. Accompanied by all the Indians, we ascended a long ridge, and reached a pure spring at the edge of the timber, where the Indians had waylaid and killed an antelope, and where the greater part of them left us. Our pacific conduct had quieted their alarms; and though at war among each other, yet all confided in us—thanks to the combined effects of power and kindness—for our arms inspired respect, and our little presents and good treatment conciliated their confidence. Here we suddenly entered snow six inches deep, and the ground was a little rocky with volcanic fragments, the mountain appearing to be composed of such rock. The timber consists principally of nut-pines (*pynus monophyllus*), which here are of larger size—twelve to fifteen inches in diameter; heaps of cones lying on the ground, where the Indians have gathered the seeds.

"The snow deepened gradually as we advanced. Our guides wore out their moccasins; and putting one of them on a horse, we enjoyed the unusual sight of an Indian who could not ride. He could not even guide the animal, and appeared to have no knowledge of horses. The snow was three or four feet deep in the summit of the pass; and from this point the guide pointed out our future road, declining to go any further. Below us was a little valley, and beyond this the mountains rose higher still, one ridge above another, presenting a rude and rocky outline. We descended rapidly to the valley; the snow impeded us but little, yet it was dark when we reached the foot of the mountain.

"After a hard day's march of twenty-seven miles, we reached the river some time after dark, and found the snow about a foot deep on the bottom—the river being entirely frozen over. There were dry willows abundant, and we soon had blazing fires. A little brandy, which I husbanded with great care remained, and I do not know any medicine more salutary, or any drink (except coffee) more agreeable, than this on a cold night after a hard day's march. The next morning, when the sun had not yet risen over the mountains, the thermometer was 2 deg. below zero; but the sky was bright, and the weather changed rapidly into a pleasant day of summer."

On the 28th of January the party travelled through the pass, after a hard day's journey of twelve miles, and encamped on a high point where the snow had been blown off, and the exposed grass afforded a scanty pasture for the horses. Snow, and the broken country made the travelling difficult, and they were often compelled to make large circuits, and ascend the highest and most exposed ridges, in order to avoid snow, which in other places was banked up to a great depth.

During the day a few Indians were seen circling around on snow shoes, and skimming along like birds, but they could not bring them within speaking distance. They would not allow one to approach, but, breaking into a laugh skimmed off over the snow, seeming to have no idea of the power of fire-arms.

"To-night," says Captain Fremont, "we did not succeed in getting the howitzer into camp. This was the most laborious day we had yet passed through, the steep ascents and deep snow exhausting both men and animals. Our single chronometer had stopped during the day, and its error in time occasioned the loss of an eclipse of a satellite this evening. It had not preserved the rate with which we started from the Dalles, and this will account for the absence of longitudes along this interval of our journey.

"The party," says Captain Fremont, "had now entirely left the desert country, and were on the verge of a region which, extending westward to the shores of the Pacific, abounds in large game, and is covered with a singular luxuriance of vegetable life."

The journey, however, for several days, was fatiguing and dreary. Snow and ice, elevated ridges, from 6000 to 7000 feet high, and deep ravines were crossed, meeting occasionally with some wretched natives. The mules were one by one falling off. A dog was killed and eaten. In about latitude 38 deg. north, Captain Fremont says—"On the 2nd and 3rd of February it had ceased snowing, and this morning the lower air was clear and frosty: and 6000 or 7000 feet above, the peaks of the Sierra (Nevada), now and then appeared among the rolling clouds which were rapidly dispersing before the sun. Our Indian shook his head as he pointed to the icy pinnacles, shooting high up into the sky, and seeming almost immediately above us. Crossing the river on the ice, and leaving it immediately, we commenced the ascent of the mountain along the valley of a tributary stream. The people were unusually silent; for every man knew that our enterprise was hazardous, and the issue doubtful.

"The snow deepened rapidly, and it soon became necessary to break a road. For this service, a party of ten was formed, mounted on the strongest horses; each man in succession opening the road on foot, or on horseback, until himself and his horse became fatigued, when he stepped aside, the remaining number passing ahead, he took his station in the rear. Leaving this stream, and pursuing a very direct course, we passed over an intervening ridge to the river we had left. On the way we passed two low huts entirely covered with snow, which might very

easily have escaped observation. A family was living in each; and the only trail I saw in the neighbourhood was from the door-hole to a nut-pine tree, which supplied them with food and fuel. We found two similar huts on the creek where we next arrived; and, travelling a little higher up, encamped on its banks in about four feet of snow.

"The nut-pines were now giving way to heavy timber, and there were some immense pines on the bottom, around the roots of which the sun had melted away the snow; and here we built our camps and made huge fires. To-day we had travelled sixteen miles, and our elevation above the sea was 6760 feet.

"On the following morning, turning our faces directly towards the main chain, we ascended an open hollow along a small tributary to the river, which, according to the Indians, issues from a mountain to the south. The snow was so deep in the hollow, that we were obliged to travel along the steep hill sides, and over spurs, where wind and sun had in places lessened the snow, and where the grass, along the sides of the mountains, was exposed."

The journey was in this manner continued to the summit ridge, which presented a range of naked peaks, apparently destitute of snow and vegetation; below, the whole country was covered with timber of extraordinary size.

"Towards a pass, which the guide indicated, we attempted in the afternoon of the 4th, to force a road; but after a laborious plunging through two or three hundred yards, our best horses gave out, entirely refusing to make any further effort; and, for the time, we were brought to a stand. The guide informed us that we were entering the deep snow, and here began the difficulties of the mountain; and to him, and almost to all, our enterprise seemed hopeless."

The camp had been all the day occupied in endeavouring to ascend the hill, but only the best horses had succeeded; the animals, generally, not having sufficient strength to bring themselves up without the packs; and all the line of road between this and the springs, where the party encamped the previous night, were strewn with camp stores and equipage, and horses floundering in snow.

At night they had no shelter, but made a large fire around the trunk of one of the huge pines; and covering the snow with small boughs, on which they spread their blankets, they encamped. The night was very bright and clear, though the thermometer was only at 10 deg. A strong wind, which sprang up at sundown, made it intensely cold; and this was one of the bitterest nights during the journey.

"It had been too cold to sleep, and in the morning our guide was standing by the fire with all his finery on; and seeing him shiver in the cold, I threw on his shoulders one of my blankets. We missed him a few minutes afterwards, and never saw him again. He had deserted. His bad faith and treachery were in perfect keeping with the estimate of Indian character, which a long intercourse with this people had gradually forced upon my mind.

"While a portion of the camp were occupied in bringing up the baggage to

this point, the remainder were busied in making sledges and snow-shoes. I had determined to explore the mountain ahead, and the sledges were to be used in transporting the baggage.

"The mountains here consisted wholly of a white micaceous granite. The day was perfectly clear, and, while the sun was in the sky, warm and pleasant. By observation, our latitude was 38 deg. 42 min. 26 sec. ; and elevation, by the boiling point, 7400 feet."

On the 6th February the party were engaged chiefly in opening a road through the snow, and on the morning of the following day, says Captain Fremont,
